

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, MARCH 9, 1901.

[No. 105.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE present issue is the 105th number of the *Motor-Car Journal*, and commences the third volume. Since our first bow to the public two years ago the industry has made giant strides, and stands to-day unmistakably upon a firm basis. The *Journal* has marched side by side with the progress of the trade, and has so consolidated its position that at the present time its importance and influence is second to that of no other similar journal in the world.

The Automobile Club.

THE first meeting of the new Club Committee was held on Tuesday last, at which Mr. Roger W. Wallace was appointed Chairman of the Administrative Committee and also of the Club Committee, Standing Committee, and the Club generally. Resolutions recording the services rendered to the Club by Mr. F. R. Simms and Mr. Harrington Moore were adopted, both gentlemen replying. The Hon. John Scott Montagu, M.P., and Mr. Mark Mayhew, L.C.C., were elected vice-chairmen of the Administrative Committee, Mr. Paris Singer as hon. treasurer, and Mr. Harrington Moore, hon. secretary. Quite a number of other business matters were dealt with, various committees elected, while a vote of thanks was accorded to Mr. Frank Butler for serving as hon. treasurer. Correspondence concerning the proposed tour in Ireland was submitted, and the recommendation of the Standing Committee was approved, viz., that the Irish Automobile Club be invited to proceed with their scheme for an automobile tour in Ireland, and should be asked to arrange that the tour should take place in August, and should terminate on such a date as would permit of members participating in it being at Glasgow by the end of August.

Some Automobile Experiences.

FOLLOWING the house dinner of the Automobile Club, on Wednesday next, Mr. Henry Edmunds will open a discussion on "Some Automobile Experiences." The object of the discussion is not to discuss hairbreadth escapes, but rather to take up the various experiences that different members have had with regard to the management and control of their own cars under ordinary running, or under conditions of accident and failure, and expedients resorted to in order to overcome temporary difficulties.

The Protest Renewed.

REGARDING the protest we raised in our last issue as to the excessive speed indulged in by the driver of an unfinished four-cylindere car, we have to state that several further complaints have reached us, our correspondents in each instance stating their impression that the car referred to was the same that passed us in Hyde Park. One writer remarks he was in Piccadilly the other evening about eleven o'clock and the same car passed, the owner, apparently, driving. There were several men on the car, and these were all shouting like firemen. A

great commotion was caused, and we are surprised the police did not take some action in the matter. We have personally made inquiries of owners of four-cylindere vehicles, but have been unable to trace what make the car is. It is of foreign construction, and is neither a Daimler, a Napier, nor a Canello-Durkopp.

Mr. J. S. Critchley Interviewed.

MR. CRITCHLEY, while in America, did not fail to escape the attention of the interviewer, and the result was the appearance of an article three-quarters of a column long, in the *Sun*, descriptive of that gentleman's views on automobilism in America. He considers New York two years behind London in the use of automobiles generally, but the former city is much in advance with its small electric vehicles, and he thinks "some of the developments along that line will soon be imported by us."

The Automobile Club "Garage."

WE learn that Mr. Harrington Moore, the honorary secretary of the Automobile Club, has leased a building next to the Royal Aquarium, Westminster, which he is willing to make into a store for motor-vehicles belonging to members of the Club, provided that twenty-two members take season tickets. A yearly season ticket, which will cost £18, will give a member a right to store his automobile in the Club *garage* at any time, day or night, and will be allotted to the twenty-two members who first apply for them. The *garage*, which is within half a mile of the Club premises, will be open from 8 a.m. to 12 midnight. In addition to being a store for motor-vehicles, arrangements are being made that cars can be washed and repaired on the premises.

Military Motor Vehicles.

THE value of the automobile in war has recently attracted a considerable amount of attention in this country, and it is therefore interesting to observe the extent to which it has been adopted in the French army. Its principal field of utility is evidently considered to be that of heavy transport, for which petrol lorries by Panhard, De Dietrich, etc., have been employed, as well as Scotte steam tractors. This finds a parallel in the employment of traction engines as adopted so successfully in South Africa, and there is little likelihood that for such purposes the traction-engine will find a serious competitor in the self-contained motor-wagon, over which it has many advantages even where good roads are available, while it stands alone in its ability to traverse rough country. Next in importance comes such light transport as is required in the ambulance, field telegraph, and postal services, where a lighter and faster vehicle would seem to have a distinct sphere of utility, which our Gallic neighbours have been the first to recognise. The last class is that of fast cars for the conveyance of officers and orders. No idea appears to be at present entertained of the transport of any considerable number of troops, or even scouts, per automobile, though a proposal was brought forward in the Chamber a few months ago for a census of private cars, to be "commandeered" on emergency.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

The Paris-Roubaix Alcohol Race.

THE organising committee of the Paris-Roubaix alcohol consumption race, under the auspices of the *Auto-Velo*, have met and decided to have the following seven classes:—(1) quadricycles, (2) voituresses up to 250 kilos., (3) light cars of 250 to 400 kilos., (4) cars of 400 to 650 kilos., (5) cars of 650 to 1,000 kilos., (6) big, heavy cars, (7) lorries and delivery vans. The maximum speed for cars is to be 30 kilos. and the minimum 20 kilos. In all the classes there will be a special classification according to the percentage of alcohol used: (a) pure alcohol, (b) mixture containing at least 75 per cent. of alcohol, and (c) mixture containing at least 50 per cent. of alcohol. Competitors are allowed to make the journey in two stages, stopping at Amiens. The start will be given on Easter Sunday and Monday morning.

The Automobile Club of America.

THE new rooms of the Automobile Club of America, at 753, Fifth Avenue, New York, were formally opened on the 16th ult. The new quarters consist of a suite of four rooms on the second floor of the bank building, which occupies the south-east corner of Fifty-eighth Street and

A LOCOMOBILE IN DISMAL SWAMP.

Fifth Avenue. The front or reception room is spacious and is elegantly furnished throughout in characteristic automobile red. The corner window affords a view of the Plaza, the avenue above Fifty-ninth Street, and the entrance to Central Park. A library, done in green, opens off from the reception room. Here bound volumes of periodicals and technical works on the automobile are to be found. In the rear of the reception room and central in the suite is the office, of which Mr. F. R. Tousey, Acting Secretary, is in charge. In the rear is the grill room, quaintly furnished throughout in the Dutch style. A series of lockers is fitted up on one side of this room, each bearing the name of a member. It is the general verdict that the work of the Committee having in charge the work of fitting up the new quarters is above criticism.

Motor-Bicycles.

CONSIDERABLE attention is now being given to the motor-bicycle, an instrument which has long since been desired, but hitherto has scarcely been practicable. The modern bicycle has been cut to the finest limits of weight, and builders scarcely understand any other strains but those which the bicycle can resist. This fact leads us to fear that many of the

motor-bicycles now being put on the market are scarcely calculated to withstand the special stresses set up by attaching a high speed motor to such a delicate machine as a bicycle. In what direction such strains will take effect it is difficult to say, and experience alone will demonstrate the defects to be guarded against; but there is sufficient justification for us to urge on makers the necessity of careful experimenting before putting models in the hands of the public. Motor-bicycles will be driven at a higher speed than ordinary cycles, and any accident due to collapse of the forks or other vital parts may lead to very serious accidents: indeed a few such would be almost sufficient to kill the industry.

The Sultan of Turkey's Motor-Car.

On another page we illustrate the voituress lately supplied to the Sultan of Turkey by the Gesellschaft für Motor und Motorfahrzeugbau (Gudell and Co.), of Aix-la-Chapelle, through the Turkish Ambassador at the German Court. Various accounts are to hand from Constantinople regarding the vehicle, and it seems to be still an open question whether the Sultan has become an automobilist, or merely the owner of a motor-car. One tale is to the effect that he has not cared to trust his body to the vehicle, two officers of the Court being appointed to take drives for him, the Sultan enjoying himself by watching from his window the departure and return of the car. On the other hand, another story which has reached us is that the Sultan, with his strongly developed taste for mechanics, quickly mastered every detail of the machinery, and became so delighted with the means of rapid locomotion which it afforded that he insisted on several members of the Turkish Court also learning the handling of motor-vehicles, which are now permitted to be used in his dominions.

The Road Question.

THE current number of *Pearson's Magazine* contains an interesting account of the efforts made by the United States Government to encourage road-making, the means chiefly relied on being annual practical demonstrations on short stretches of road in each State. One method that has apparently obtained official recognition is the laying of an eight-inch steel plateway, presumably in an otherwise bad road, to suit the average gauge of wagon wheels, a system that would hardly meet with approval here, the more so that its cost is nearly equal to that of a good macadam road, the construction of which is also included in the curriculum. The authorities evidently believe, and doubtless with good reason, that, given the instruction, the level-headed citizens will not be dilatory in putting it into practice. On this side of the Atlantic, however, there has been no lack of expert information disseminated by such bodies as the Roads Improvement Association, but in many places the transition from theory to practice has been delayed by the inertia and conservatism of local authorities. A remarkable improvement in the roads of one county some time back followed the provision of a bicycle for the road surveyor in lieu of the allowance for horse and trap formerly made to him, and with the increasing representation that self-propelled traffic is obtaining on our public bodies there can be little doubt that the road question will receive a greater share of attention than hitherto. It is greatly to be desired, however, that some means of equalising the standard of road construction throughout the country, of course with due consideration for local conditions, could be devised, such as in France is attained by the military supervision of the *Routes Nationales*.

The Estcourt Valve.

SOME time since we mentioned our purchase of a pair of Estcourt valves with a view to testing them on the engine of an M.M.C. Panhard. They were fitted prior to starting on the Christmas tour to Plymouth, but as we had not sufficiently taken into consideration the strength of the head-wind and the state of the roads, we felt somewhat dissatisfied at the way the car was pulling. The valves were

changed at Basingstoke; then again we tried one Estcourt valve at Salisbury; and so travelled to Plymouth. In that interesting country town we "re-ground in" the valves, and afterwards the car pulled famously, enabling us to do in one day a run of over 120 miles. Since then the valves have been in continuous use, and we consider that they are of practical value and considerable assistance in obtaining the maximum of power out of a motor. They may be somewhat slow in "picking up" on changing speeds, but their use is to be recommended.

The Nice Week.

THE automobile season at Nice will present a number of interesting events. The "Grande Semaine," the week of automobile fêtes organised by the Nice Automobile Club, will commence on the 24th inst. and last until the 31st inst. The programme opens with an automobile flower fête on the 24th inst., while on the 25th inst. there are to be two races. The first is a contest on the Nice-Aix-Sénas-Salons-Aix-Nice route, the distance being 460 kilos. It is divided into three categories:—(1) Motor-cycles and voiturettes weighing less than 250 kilos., (2) cars weighing between 250 and 400 kilos., and (3) cars weighing over 400 kilos. The second race is for touring cars, the route being from Nice to Dragnignan and back, a distance of about 198 kilos. On the 26th and 27th inst. the competing vehicles will be on exhibition. The Baron Henri de Rothschild's cup will be competed for on the 28th inst. The race is open to all vehicles weighing more than 600 kilos., and carrying two persons. It is a speed race with flying start, and will be held on the cement track of the Promenade des Anglais; the distance is one kilometre. Only the cars making the distance in less than one minute will be counted. This is a challenge cup, and will be competed for each year at the same period. On Friday, the 29th inst., the annual Nice-La-Turbie race (16 kilos.) will be run off, an illuminated automobile fête taking place the same evening. The week's meeting will be brought to an end on the 31st inst. by a race from Nice to Lorgues and back, a distance of 264 kilos.

"Light, More Light!"

GOETHE'S last exclamation is sympathetically echoed by the nocturnal motorist, whose habits have failed—such is the tardiness of evolutionary processes—to endow him with the enviable faculty of the common or domestic cat. Candle lamps, which by a perverse conservatism are still sometimes supplied with cars, are little more than useless; and even the Dietz lamp, which is undoubtedly convenient, falls far short of what is desirable, though a pair—one with lens front and one with plain glass—serve their purpose if high speeds are not indulged in. But there is little pleasure in driving at night unless these are supplemented by a good acetylene headlight, and acetylene lamps as a rule require more attention than most drivers care to give if they are to perform satisfactorily. Our attention was attracted a short time ago by a brilliantly illuminated establishment at the east end of the Embankment, where an incandescent oil burner of American origin is displayed. The only lamps shown were for fixed lighting, but we were informed that locomotive headlights on the same system were used on the Pennsylvania railroad. It would therefore appear that vibration is no bar to their employment, and as the lamps shown were of 500 candle power and upwards, with a consumption of half a pint of oil an hour, their efficiency is obvious. If a lamp of this kind suitable for motor-cars were introduced, it would undoubtedly be much in demand.

The Advertising Value of the Motor-Car.

THE advertising value of the motor-car was early recognised by a number of progressive business houses. It is true the advertising value of these vehicles was greatest when they were an entire novelty, but even now they are far from common, and hence possess considerable advertising value,

especially in lines of business which are themselves in a developing state, where the use of a motor-car proves its owner to be a man of progressive ideas, who means to be at the head of the procession in his special line.

Another Victory for the Motor-Car in France.

"Is a motor-car inelegant and a nuisance?" is the question which the Fifth Chamber of the Seine Tribunal has lately been discussing, deciding the question in the negative, and in favour of the new locomotion. The appeal for a legal judgment on the point was made by Mme. de la Ville le Roulx, who is a tenant in a house owned by Count de la Rochefoucauld, in which the latter also resides. Having purchased an electric motor-car the lady naturally had the vehicle driven into the courtyard of the building. Thereupon the landlord objected, on the ground that the car incommoded him when brought into the yard by its noise and its appearance, which further spoiled the look of the house. Madame de la Ville le Roulx on the next occasion was prevented from driving into the courtyard of the house in her automobile, and consequently instituted legal proceedings. At the hearing of the case, counsel for Count de la Rochefoucauld described automobiles generally in the above-mentioned depreciatory terms, and stated that by tacit consent between landlord and tenant Mme. de la Ville le Roulx was not entitled to have any other vehicle in the courtyard except a carriage drawn by horses. The Court has, however, rejected the Count's plea on all points, recognising no legal difference in the sense referred to between horseless and horse-drawn vehicles, and has decided that the lady may cause to be driven into the courtyard any motor-car which she may use. The landlord has been directed to give orders to this effect under pain of being mulcted in £1 damages for every breach of the Court's injunction.

THE WINTON DELIVERY VAN SUPPLIED TO THE POSTAL AUTHORITIES AT SYDNEY, N.S.W. (See issue February 23, p. 872.)

"Maximite" and "Motorite."

THE *Daily Mail*, always a fruitful source of knowledge, informs its readers that Mr. Hudson Maxim has caused a profound sensation in New York by announcing that his new high explosive called "Maximite," in conjunction with a substance called "Motorite," applied to an automobile torpedo, is, in the first instance, capable of hurling a projectile at a velocity of 5,000 feet per second, and in the second is capable of driving a vessel under water at the rate of three-quarters of a mile per minute. "Maximite," to our knowledge, is not a new substance, as we have had specimen blocks in our office for the last three years. With regard to the "Motorite," we trust Mr. Hudson Maxim will be more successful with this substance, what

ever it is, than he was with a steam motor-car upon which he spent so much time and others so much money.

The Automobile Club Show.

THE near approach of the forthcoming Automobile Club Exhibition is already arousing curiosity as to the novelties which will be exhibited. Without betraying any secrets we may mention that there will be several new steam cars on view, also a variety of new petrol motors, while the exhibition will be remarkable for the number of new firms entering the trade. Foreign concerns promise, as usual, to be well represented, and altogether the 1901 exhibition will mark an epoch in the British automobile world.

Importing Cars in the United States.

IN a recent issue we referred to two 12 h.p. Panhard cars, which had been shipped from Paris to Mr. J. W. S. Langerman in New York. The arrival of these vehicles on the other side of the Atlantic has been the cause of some excitement. It appears that the cars were entered at the port of New York as second-hand, but the U.S. Customs officials classed them as new, and accordingly subject to regular rates of duty, and "held up" the vehicles until the import duty was paid. The *New York Herald* states that, under the general provisions of the law, new vehicles or those not in possession of the owner one year must pay an import duty of 45 per cent. *ad valorem*. When the person has actually owned and used the automobile in a foreign country more than a year, the vehicle is admitted free. If the car was bought as second-hand within any period less than a year, that fact does not permit of its importation free of duty.

Progress in Philadelphia.

THE rapid increase in the use of motor-cars in Philadelphia is best shown by the statistics which are kept by the officials of Fairmount Park. Mechanical carriages, first admitted in 1900, are now permitted to use all the Park drives with the exception of the Wissahickon Drive, and the West River Drive from Girard Avenue Bridge to the Falls. Every motor-vehicle must display a number on the back, the numbers being issued without charge by the Fairmount Park commission. To date 230 such numbers have been taken out. In his annual report, just issued, Captain Chasteau, of the Park guard, reports for 1900, in comparison with 1899, that there was an increase in the number of automobiles passing in the various entrances of the Park of 6,693.

The Pioneer American Physician Motorist.

THE first physician in the United States to make regular use of a motor-car in his practice is said to be Dr. Carlos C. Booth, of Youngstown, Ohio. In 1895 he had manufactured a petrol car in accordance to his own designs. So far as convenience and economy were concerned he reports that it was a success, but as it was the only one in the city at the time it occasioned such a commotion among the horses that after eighteen months of continuous use the doctor abandoned it and returned to the horse, which he has since used. Several local business men are about to purchase motor-cars, however, and as soon as they do, and he has someone to share the responsibility, the doctor states that he will again purchase one.

Motor-Car Services for Ceylon.

THE rumour that a motor-car service is likely to be established between Negombo and Chilaw is hailed with delight by the Cingalese. The present uncomfortable and unsatisfactory horse coach service between Negombo and Chilaw is admittedly an unavoidable hardship and a necessary evil, because it is the occasion of bodily torture as well as mental preturbation to venturesome travellers. The bullock coach between Chilaw and Puttalam, whether by night or by day, is simply a purgatory on

wheels, and a man must verily be endued with the patience of the Patriarch of Uz who can accomplish the journey without indulging in expletives, liberally garnished with adjectives, and doggedly looking what he cannot adequately express. What a happy day it will be when these means of locomotion are forgotten altogether, or, if remembered at all, but as a dream. The elimination of the coach horse, especially, should be a great epoch in our lives if, simultaneously, suggests a local journalist, beef-steaks and joints became cheaper by coach bullocks being at a discount.

The "Onlooker" Prophetes.

WITHOUT laying claim to more than our fair share of prophetic inspiration, we think we are safe, remarks the *Onlooker*, in hazarding the statement that one of the events for which the opening of the Twentieth Century will be remarkable will be the coming of the motor-car. The motor is, so to speak, in the air; before long it may be in the street. Locomotion by motor is at present in its infancy, but unless our acumen is at fault, it is fast outgrowing the ailments of infancy, and will then grow fast. Hitherto, all machines have been more or less experimental, but every fresh experiment is a step nearer to success. Before long, we see no reason to doubt, mechanical ingenuity will construct a machine that answers to all reasonable demands, and in point of expense will not be only the rich man's toy. When this has happened the motor will become a new factor in social life, the effects of which it would be dangerous to forecast, but which must in any case be far reaching.

Agitation in America.

THERE is evidently trouble brewing in the United States, for now the farmers in many leading States are agitating against the automobile with all the stubbornness and ignorance of the subject of the average British county councillor. The bye-laws of the Madison Council are only typical of the action of many similar bodies, and it is apparently becoming a general thing to restrict the speed in some of the lesser towns to eight miles an hour. Even Mr. Vanderbilt will have to be careful.

Index to Volume II.

WITH this issue is inserted a full and carefully prepared index of the leading events which have appeared in our columns during the past twelve months. Last year we made a special and extra charge for the index; but, recognising from the large demand how desirous our readers were of having the *Journal* bound in volume form, we have decided to distribute the index in the form of a supplement free of cost to our readers. We trust this innovation will be appreciated.

America and Queen Victoria.

VERY remarkable was the feeling inspired in the United States by the death of Queen Victoria, and every mail from America brings evidence of the sympathy of the people of the Republic with those of this country. "The recent news of the death of Queen Victoria," says one of the leading automobile manufacturers of the States, of whose noble reign we, as well as you, are proud, is received by every American with the profoundest grief, and besides the official and public testimonials of condolence returned to your side, we are sure that unuttered sympathy is present in the heart of every American." This is but a typical utterance from many we have received.

THE Union Automobile de France is organising a *rallye papier* for Sunday, the 17th inst.

ONE hundred and eighty-two permits have been granted by the Commissioners allowing the holders to take motor-vehicles through Fairmount Park, Philadelphia. Seventeen doctors and two ladies are recorded in the list as favouring the new locomotion.

The Daimler 20 h.p. Motor-Car.

THE above illustration depicts the 20 h.p. car which the Daimler Motor Co., Ltd., have just delivered to Mr. Talbot Clifton, of Lytham. The four-cylinder engine, which develops about 25 h.p., is fitted with both electric and tube ignition. The vehicle comprises all the latest improvements of the Daimler Company, water-cooling coils being fitted both fore and aft. The body takes the form of a comfortable *tonneau*, while the road wheels are shod with Clipper pneumatic tires. We learn that the Daimler Company have lately supplied a similar car to the Hon. John Scott-Montagu, M.P.

COUNTY COUNCILS AND MOTOR-CARS, ISLE OF WIGHT.

AT a meeting of the Isle of Wight County Council last week Councillor Matthews moved that the Clerk to the Council be requested to draw the attention of the Home Secretary to the way in which motor-cars now traverse the roads, and suggesting that every car should carry a number in a conspicuous place, that the same should be registered, and be obliged to stop when signalled to do so. After the resolution had been seconded, Lieut.-Colonel Hamilton said he did not believe in this grandmotherly legislation, which could only have the effect of crippling a new industry. One would think the drivers of motor-cars were frequently dashing about their roads endangering the lives of the inhabitants, but such was not the case. Councillor Sweetman also joined in the protest against any labels being placed upon the drivers of motor-cars. Councillor F. T. Mew said he could give two instances of reckless motor car driving. On one occasion at Ryde a motor-car cut the fetlock and shoulder joint of a horse he was driving; and again at Parkhurst, whilst driving a young and rather skittish animal down the hill, he held up his hand for the driver to stop, but he drove on, so that he (Mr. Mew) was quite unable to say who the person was that was driving this "instrument of torture." Councillor E. Matthews thought they ought to get all the motor-cars in the island that they could. Councillor Barrington did not think their roads were adapted for these travelling cars. He hoped motorists would not be encouraged to come there unless their cars were numbered. Councillor Williams moved as an amendment that the matter be referred back to committee to further consider, and report to the Council. Councillor Ingram seconded, declaring that no one could make "top nor tail" of the resolution. The amendment was adopted.

THE Erster Automobil Club in Böhmen is the name adopted by a new club just formed in Prague, Bohemia.

MR. HENRY SANDERS, 37, Nicholas Quay, V.O., St. Petersburg, would be glad to receive copies of catalogues from English builders of motor-cars.

THE Grand Duke Nicholas Mikhailovitch has placed an order for a 10-h. p. Mors car for use on his estates in the Caucasus.

SOME experiments with a motor-sleigh were made at Nuremberg, Germany, a few days ago. The vehicle was made by the Union Motor-Fahrzeug Gesellschaft, of that town.

A LECTURE was given on Thursday evening last week in the Institute Small Hall, Wolverton, by Mr. J. A. Roebuck, of Coventry. The lecturer said he wished to speak of the working and mechanism of standard types of motor-cars, and speaking of the motive power, Mr. Roebuck said he considered petrol the best. A number of lantern slides were shown, depicting the various well-known types of motor-cars now running, including Daimler, Benz, etc.

MESSRS. GRAY AND DAVIS, Amesbury, Mass., have introduced a new carriage lamp designed to also light up the water-glass on a steam-car. It is stated that formerly it required three miniature electric lamps or one bicycle lamp to show the water level in the dark. In the new lamp part of the light from the burner is thrown on to a lens in the bottom of the lamp case. This lens is in line with the flame and the water-glass, and throws a beam of light directly on the latter, which is reflected in the usual mirror just inside the dashboard.

THE four conditions which determine a choice of any particular method of transport are distance, expense, time, and convenience, and it is along these lines that the person who is thinking about getting a motor-car must proceed to an ultimate selection.

CORRESPONDENCE.

THE BOLLEE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Zero," I may say that I have owned one of these excellent little machines for over three years, and therefore consider myself competent to answer his queries. The running cost is very cheap. Petrol at 1s. 6d. per gallon will last about thirty-five miles to the gallon. One pint of gas engine oil (best) at 4s. per gallon will last seventy miles. Thus the working expenses come to 3s. 6d. per seventy miles, i.e., 3.5d. per mile. This is certainly cheap running. I do not know so cheap a motor-car as the Bollée.

So much for working expenses. The gears are not more noisy than on other gear-driven cars. My top and second speed gears are practically silent. The secret is, do not drive with the belt any tighter than necessary. My back tire does not give me any trouble. It is the second new one I have had. The one on the machine when delivered had seen its best days, so three months after I had a new one fitted. This lasted twelve months, during which time the machine was in continuous operation. The second is the one on now, and is as good as new. Lastly, my engine never gets unduly hot—up hill and down dale. No matter whether it be under the burning heat of a midday sun in August or the ice cold of a January night, it is always the same. Many people will endorse my opinion that the Bollée is one of the best small voiturettes made. I, for my part, say the best. I have a 6 h.p. M.M.C. Panhard and a 3 h.p. De Dion, but I would sooner part with both of them than my Bollée.

Yours truly,

ALAN A. L. HICKMAN.

A SINGLE-SEATED CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Mr. Maudslay's letter in your issue of last week, I beg to inform him that some considerable time ago I designed an automobile upon the same lines as he describes. For doctors, travellers, and others this type of carriage is a *sine qua non*, as it is a small and compact one-seated vehicle possessing all the advantages of a larger car, without the drawbacks of a motor-cycle. This type will undoubtedly prove a great boon, and can be produced at a moderate figure.

If your correspondent cares to communicate with me I shall be happy to furnish him with fuller particulars.

Yours truly,

HUGH OWEN.

MOTOR BICYCLES AND FOOTWARMERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is strange to see how persistent is the fallacy that a low centre of gravity diminishes side-slip. A little reflection will show that the higher the c.g., the less inclination is necessary to maintain equilibrium, and the less is the resultant force at right angles to line of progression and parallel with the road. The old ordinary, with a high centre of gravity, was less apt to side-slip than the safety, for this reason, and the same principle applies to motor-bicycles. On the other hand, other things being equal, a driving wheel is more likely to slip than a merely supporting wheel; it is more serious for the front wheel of a safety to slip than the back; therefore it seems that the back wheel should be the driver. Still, I prefer a front-driver with a high centre of gravity to a rear-driver with a low one, and think the position of centre of gravity compensates for the other disadvantages of front-driving. One desirable point in a belt-driven bicycle is a jockey-pulley, loose belts having been nearly the only trouble I have experienced with such machines.

With reference to Mr. Aldred's letter, I use acetate of soda, and pay 7d. per lb. in 7lb. lots. It boils at a higher temperature than most other solutions—e.g., a 60 per cent. solution of nitrate of soda boils at 245 deg., or thereabouts, a 30 per cent. one of salt at 224 deg., a 74 per cent. one of nitrate of potash at

238 deg. I cannot give figures for *hypo*, not having had time to try, but it would be liable to decompose, and perhaps act on the container.

Yours truly,

R. W. BUTTEMER.

WHY DO WE BUY FRENCH CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading the letter from Mr. S. F. Edge in your last week's issue under the above heading, and the question has been running in my head ever since, Why does he buy them? This he does not explain in his letter, but devotes himself to an explanation of another car, not French. Considering the opinion Carlyle expressed concerning the majority of the population of this country, I am uncertain whether a sufficient number of wise men could be found to form a committee to decide upon the following points, but if they could be found and would undertake the task, I think it would be interesting to have a report upon the following points:—

1. Which country produces at the present moment the best motor-car?

2. Which motor-car in that country excels in the following important details?—(a) Which costs the most money? (b) Which makes the most noise? (c) Which has the most effectual cooler? (d) Which exhausts the most gas? (e) Which consumes the largest quantity of spirit? (f) Which possesses the biggest trumpet?

Yours truly,

INQUISITOR.

A PUBLIC DENIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue we are surprised to note a letter signed by Mr. Friswell, which purports to be a copy of a letter sent to this company. Please note that we have never received such a letter, nor have we negotiated with him. We think you should ask him to produce a copy of this letter in his copy letter book, as it rather looks to us as if he had used your paper in an unfair manner.—Yours faithfully,

For the British Motor Traction Company, Ltd.,

CHAS. OSBORNE,
Secretary.

WE regret to learn of the death of Mr. Edward Delamare-Daboutville, of Fontaine-le-Bourg, Rouen, to whose carburettor reference was made in a recent issue.

THE American Consul in Amsterdam reports that the use of motor vehicles in Holland is becoming general, and that the prospects are good.

IN addition to those already mentioned, the undermentioned companies and firms have also signed the manufacturers' memorial to county councillors: Bayleys, Ltd., Southwark, S.E.; Coborn Motor Company, Baythorne Street, E.; J. Coop, Southport; F. W. Hudllass, Southport; London Motor Company, Ltd., London, W.; Motogear Engineering Company, Cowper Street, E.C.; and the Roadway Autocar Company, Ltd., Berners Street, W.

THE Stanley Manufacturing Company, Boston, Mass., recently sold one of their compound engine and boilers to a lumberman at Moosehead Lake, Me., who mounted it upon a sled to carry logs over the ice. The method of driving was by means of a long screw lengthwise of the sled, with sharpened edge cutting into the ice, and forcing the sled forward at a high speed; at times, it is said, reaching 40 miles an hour.

EXPRESS trains in Italy are not exactly what their name would imply, still they are swift enough to make the following performance of note: Signor Marino Torlonia has just beaten the express train from Rome to Civita Vecchia on his automobile. Signor Torlonia started at the same time as the express, and, although greatly impeded by traffic, travelled the forty-three and one-half miles in time to be at the railway station and greet Commendatore Silvestrelli on his descending from the train at Civita Vecchia.

THE SCOTTISH AUTOMOBILE CLUB.

THE Scottish Automobile Club had a run to Bathgate on Saturday last, the 2nd inst., the members of the Club with their friends from Edinburgh meeting the Glasgow members at this town, which is half-way between the two cities. The larger number of cars and members came from Edinburgh, meeting in St. Andrew's Square at 11.30, and leaving in processional order a few minutes later, making some sensation as they passed along Princes Street, and through the residential quarter of the West End of the city. Professor Dawson Turner, M.D., led the party on his 10 h.p. Delahaye car, having as his passengers Mrs. Dawson Turner and the Rt. Hon. Sir J. H. A. Macdonald, K.C.B., LL.D., F.R.S. (Lord Justice Clerk), President of the Club; next in order came Mr. Norman D. Macdonald, Advocate, Chairman of the Club, on Mr. Outhwaite's 7 h.p. Daimler; while following were Mr. Sleight on his De Dion voiturette with Mr. Paterson, of Aberdeen, as his fellow passenger; Mr. Outhwaite, with Mr. Macleod, on a very handsome 12 h.p. Daimler; the Rossleigh Company's waggonee with a number of passengers, including Mr. Kingsbury, of Glasgow; Mr. John Macdonald, chairman of the Edinburgh Auto-Car Company, on a 6 h.p. Daimler waggonee; while bringing up the rear were two members of the Club on tricycles, who, however, did not continue the run beyond the bounds of the city owing to the dreadful state of the roads.

The members of the Club ran together in the above order by arrangement for the first three miles till the confines of the city were reached at Corstorphine, at which point the Chairman of the Club gave the order to go "as you please," upon which Mr. Outhwaite, on the large Daimler, shot forward, and was soon out of sight. Mr. Dawson Turner was soon seen to be in difficulties, and was left behind doing repairs, which, however, were

only of a temporary nature, as the Delahaye car passed all the others except the large one above mentioned. The roads were in a terrible condition, and in consequence of the deep and sticky mud of the surface the going was very heavy. The weather, considering that it was the beginning of March, was not unfavourable, the sun shining at times, but an east wind was blowing, which made the return journey a somewhat cold run.

On the arrival at the Royal Hotel, Bathgate, several members of the Club from Glasgow were found to have already arrived, most of them having first come by train, in consequence partly of their cars developing defects the day before, but chiefly because of the bad state of the roads. The company sat down to lunch under the presidency of Mr. Norman D. Macdonald, while Mr. John Macdonald acted as croupier. The members of the Club and their friends numbered upwards of thirty-five, with the result that the luncheon had to be served in two relays, as the room would not accommodate the whole company at once. This prevented anything in the shape of a toast list, but in the interval between the lunches, while all the company were in the room, the Lord Justice Clerk briefly proposed "Success to the Scottish Automobile Club," remarking that he was glad to be present at the first run of the new century, and expressing his firm conviction that the new method of locomotion would cause as great a revolution in this century as railways had done in the past; and this not chiefly for purposes of pleasure, but for rapid inter-

communication and the transportation of commodities, to the benefit of perhaps chiefly the poorer classes of the community.

Mr. John Macdonald in a few words proposed his lordship's health, which was cordially pledged. As lunch was in progress Mr. Harper, of Aberdeen, arrived with a large party on his big Daimler dogcart, which owing to some mistake had not arrived at St. Andrew Square in time to start for Bathgate with the other cars. Shortly afterwards the company took the road again in some haste, as rain was threatening, but this happily proved a false alarm.

On the return journey the Lord Justice Clerk travelled on the 12 h.p. Daimler, his place on Dr. Dawson Turner's car being taken by the Chairman of the Club. The latter car, starting first, easily kept in the van, and covered the eighteen miles to Edinburgh in 55 min., in spite of a strong head wind and deep sticky mud, which was in the very worst condition for pneumatic tires. Several of the members from Glasgow found seats on the cars, which were going to Edinburgh, and came through to that city for the pleasure of the run, returning by rail in the evening. On the whole a most enjoyable day was spent.

MESSRS. F. W. TOUSEY and R. E. JARIGE have been elected by the board of governors of the Automobile Club of America as a committee to attend to the erection of sign posts on the main roads leading out of New York city.

LETTERS of incorporation have been granted to the Electric Cab Company, Limited, of Toronto, Canada. The company will establish at once eight or more electric cabs at regular rates, as well as two electric tallyhos for the tourist trade.

THE German Minister of the Home Department has issued an order to all local authorities to give motor-vehicles and their users all attention and care, to encourage the growing industry, and to induce foreign owners to visit

Germany with such vehicles. The order is a remarkable document, and breathes through every sentence the recognition of the motor-car as an important factor in modern life.

THE Autocar Company, Ardmore, Pa., is preparing to build a petroleum-spirit wagon having a capacity of 3 tons and a maximum speed of 12 miles an hour. The motor will be a four-cylinder vertical engine giving 20 h.p. at 900 revolutions. The company has also under way a special touring car with a 20 h.p. motor.

THE post-office authorities at Columbus, Ohio, are considering a proposition made to them by the Columbus Auto-Cab and Delivery Co., which offers to carry the mails to and from the railway stations, and to make those collections which are now made by horse-wagons for much less money than this work at present costs the department.

A NEW magneto-electrical ignition machine has been put on the market by Messrs. J. Ruymen and Son, of Redkey, Ind., U.S.A., which weighs 9½ lbs. It has a slotted drum armature and a copper segment commutator. The normal speed of the machine is 2,000 revolutions per minute, though, it is claimed, it will give a good spark at 1,500. The magneto is driven off the flywheel of the engine by means of a leather-faced friction wheel, it being mounted pivotally and the friction wheel held against the flywheel through the tension of a light helical spring.

THE CUÉLL VOITURETTE, BUILT FOR THE SULTAN OF TURKEY (see page 2).

The De Dietrich Petroleum-Spirit Motor-Cars.

FIG. 1.—THE DE DIETRICH 18 H.P. RACER. (See opposite page.)

AN ENCOUNTER IN THE BOIS.

(From our Paris Correspondent.)

“YOU have made five hundred mètres in fifty-five seconds” was the remark which greeted me the other Sunday upon pulling up my 8 h.p. Panhard, obedient to the terrifying gesticulations of two *agents cyclists*, who, suddenly emerging from their lair just beyond the Jardin d’Acclimatation, had placed themselves right before me as I went spinning over the smooth surface of the *route de Madrid*. In a moment I understood the meaning of the sign made to me by Count de Dion, whom I had met a moment before, and, with visions of cheerless prison cells and an unappetising skilly before my eyes, I regretted not to have immediately interpreted his friendly warning and made my way to Suresnes by another route. A vain regret, for there before me stood the cycling Roberts already fingering voluminous pocket books and sucking official-looking lead pencils in a manner calculated to strike terror into the stoutest heart. Unostentatiously I drew back my lever from the fourth to the second speed notch, and, affecting a tranquillity which I was far from feeling, said, “I’ve made five hundred mètres in fifty-five seconds, have I? Now who told you so, mister policeman?” But never an answer did that austere man vouchsafe, contenting himself with flashing upon me a look of withering scorn, and demanding my papers. Hurt by his lack of amiability, I fumbled nervously among the folds of my goat skin for my *certificat de capacité*, and if I did present him with an unpaid tailor’s bill on pink paper instead of the official document, it was entirely due to my extreme agitation, and not, as he appeared to think, with the object of insulting him. I glanced over my shoulder to see what had become of the cars which had been following me, and I found that they had all turned turtle and fled, not as turtles, but as “teuf-teufs” with the arm of the law behind them. I was alone—figuratively speaking, for we were three in the car and there were some forty spectators on the sidewalk—and I trembled to think of my ultimate fate. In the midst of my forebodings I heard a rush and a rattle, and, looking back, saw some fifty yards astern a 12 h.p. Panhard

coming up at 60 kilomètres to the hour. The policemen saw her as soon as I, and one of them, leaving me, advanced with a haughty air and waved his white *bâton* as a command to stop. But not a bit of it; for, without slackening speed, the driver swerved his car slightly to the right and headed for a side road giving on to the *route de Madrid*. We held our breath, for the agent stuck to his ground manfully, and it appeared as though he must inevitably be run down. But when the car had approached to within a couple of yards of him his courage gave out, and he leaped for his life, leaving behind him his faithful bike. A crash, a rending of metal, a vision of flying spokes, and what had been one of the most superb cycles of M. Lepine’s brigade no longer existed except as a tangled and unrecognisable mass, while its assassin continued his mad course down the route. White with rage and terror its owner returned to where we, the danger passed, were roaring with laughter at the sight of the fragments of the bicycle, and, irritated by our mirth, he gave vent to his feelings by assuring us that “the next I catch will pay for that. I will give him six months.” My examination at length finished, I was allowed to leave, and now—well, now I await with impatience the summons to the courts.

TEN ladies are licensed to operate automobiles through the streets of Chicago.

THE Sahara has now no hidden mysteries for motors, Barons Joseph and Pierre Crawhez having managed to cross from Djelfa to Laghouat.

THE Rev. H. A. Frantz, of Cherryville, Pa., believes he has received a call to the motor-car trade, and will henceforth make petrol cars in place of sermons.

THE City and Suburban Electric Carriage Company, Limited, has been registered with a capital of £500, to carry on the business of cycle, carriage, launch, and flying machine builders, etc.

ON January 28, 1900, the municipal authorities of Chicago issued their first licence permitting its holder to run a motor-vehicle through the streets; on the same day one year later 378 such permits were in force.

THE DE DIETRICH PETROLEUM-SPIRIT MOTOR-CARS.

A TYPE of motor-car which has achieved a large measure of success in France, but which appears to be but little known in this country, is that built to the designs of M. Amedée Bollée, jun., by Messrs. De Dietrich and Co., of Luneville. The firm has turned out over 500 of these cars, and they have won many of the automobile races of the last few years. At the first automobile contest, held in connection with the Paris Exhibition, they carried away the first prize. A description of their special features may, therefore, not be without interest.

The frame (Fig. 3) is built up of channel steel, and is supported on the axles through the intermediary of four semi-elliptic springs. The frame carries the motor and all the mechanism, the disposition of these parts being such that they are entirely below the upper plane of the frame, thus permitting the use of any form of body with the same frame construction. The engine, which is constructed in two sizes, $6\frac{1}{2}$ and 9 h.p., is of the twin cylinder, horizontal type, and is always placed in front of the vehicle. The cylinders, with water jacket and cylinder head, are cast in one piece. There is but a single crank, and the explosions occur, therefore, regularly, one for every revolution. The compression

water, after being cooled in the radiator, returns direct to the cylinder packet. The makers state that with a 9 h.h. motor from twelve to fourteen metres of rubber piping enables a day's run to be made without it being necessary to refill the water tank. A constant level carburettor (Fig. 5) of comparatively simple construction is fitted. The carburettor consists of two parts, the constant level compartment and the vaporising compartment. In the former is located a float F, carrying the point *c* of a

FIG. 3. - PLAN OF DE DIETRICH CAR.

needle *A* valve, which controls the petrol supply. The petrol arrives by the tube *r*, fastened to the cover of the constant level compartment. From the constant level compartment the petrol flows through a tube and the capillary tube *t* to the vaporising chamber. Ordinarily the capillary tube *t* is closed at its upper end by a needle point of the rod *V*. This rod carries a disc, which divides the vaporising compartment into two chambers. The suction of the piston, on the intake stroke, will lift this disc off its seat, and thus simultaneously bring the two chambers of the compartment into connection, and open the capillary tube *t*. The air enters by the opening *A*, and passes upward. The concentration of the air at the orifice of tube *t*, and the stepped surface of the space between the upper and lower halves of the vaporising compartment, are calculated to produce a very complete and uniform vaporisation of the petrol. The mixture leaves by the opening *D*. A screw adjustment, on top of the vaporising compartment, permits the admission of petrol to be regulated.

Coming now to the power-transmitting mechanism, it will be seen from Fig. 3 that while the motor is located in the front portion, the intermediary shafts, of which there are two, are fitted right at the back, behind the rear road wheels. The crank shaft carries at one end a fly-wheel, and at the other a belt pulley. The

FIG. 4. - SECTION OF DE DIETRICH MOTOR.

space has, as will be seen from Fig. 4, a nearly spherical form, which is claimed to give a maximum efficiency, as the radiating or rather the conducting surface of the space is a minimum. The two exhaust valves are placed on top of the cylinder, and the induction valves below. On a stud *I* rocks a double-armed lever, similar to the one employed in the Peugeot motor. This lever obtains its rocking motion from a crank pin on a longitudinal shaft, geared to the crank-shaft by bevel gears in the ratio of 2:1. The ignition of the charge is effected by means of an incandescent tube. The normal speed of the engine is 650 revolutions per minute. A centrifugal governor, acting on the exhaust valve, is provided. By means of the governor the valve lift can be varied from zero up to about $\frac{1}{8}$ -inch—the maximum. The $6\frac{1}{2}$ -h.p. engine weighs 150 kilogrammes, and the 9 h.p. 180 kilogrammes. The cylinders are provided with a water-jacket, the circulation of water being effected by gravity, no pump being necessary. The cooling water is contained in a special tank, in which it remains cold until entirely consumed; the water is conveyed by gravity to the cylinder jackets by a single pipe of small diameter. The heated water flows to a condenser consisting of a series of pipes, usually arranged in the front part of the car. The

first intermediary shaft carries on one end fast and loose pulleys, and at the other a sleeve on which are mounted a series of gear wheels, this sleeve being controlled by means of a suitable arrangement of levers connected with the handle within easy reach of the driver. The second intermediary shaft is provided with a differential gear, a band brake, as also a series of gear

wheels, corresponding to those on the first intermediary. Four progressing rates of speed and one backward motion are provided. As will be seen from Fig. 3, the usual chains and sprockets are not employed to transmit the power from the second intermediary shaft to the rear road wheel axle, a system of bevel wheels, as shown, being employed instead. We understand, however, that in their latest model a new type of transmission gear has been adopted in substitution of the bevel gear drive.

The method of driving the road wheels through bevel pinions and gears permits of giving them the usual dish employed by

FIG. 5.—SECTION OF DE DIETRICH CARBURETTOR.

carriage builders, which considerably increases their strength. The speed changes are effected by shifting the gear carriage, which slides on the intermediate shaft. In Fig. 6 the high speed gear is shown in mesh. By shifting the sleeve to the left, the second, third and the fourth or low speed are obtained successively. For the reverse motion there is an extra pinion on a shaft, having a bearing at the end of a single arm lever. When it is desired to run backwards, the gear carriage is shifted into a position where all of the gears are out of mesh. The low-speed pinion and gear are then beside each other; the extra pinion, just referred to, has the same breadth as the low-speed pinion and gear together; it is swung around on its pivoting shaft, which is parallel with the shaft on which it

FIG. 6.—THE DE DIETRICH VARIABLE SPEED GEAR.

turns, and connects the slow-speed pinion with the slow-speed gear. The motion obtained in this manner is, of course, reversed. As already mentioned, the differential shaft is connected to the road wheels by means of two shafts running lengthwise of the vehicle, and carrying bevel pinions at their ends. These shafts, which are in two parts connected by a universal joint, pass through the centre of the rear stationary axle. The axle is worked into a loop at this point, into which fastens a long bronze

bearing box. Combination bevel gears and brake drums are bolted to the spokes of the rear road wheels.

Steering is controlled by a horizontal or inclined hand-wheel: all the speed-controlling and steering levers are placed within easy reach of the driver. The speed-changing and hand brake levers, as also the lever controlling the main driving belt, are all so combined that the action of applying the band brake also ships the belt on to the loose pulley, and thus throws the motor out of gear with the power-transmitting mechanism. In addition to the hand brake, brakes of the ordinary type, applied to drums on the rear wheels, are also fitted. The road wheels are of the wooden artillery type shod with solid rubber or pneumatic tires.

GRINDING VALVES.

THE exhaust valves of air-cooled motors of more than 2 h.p. easily become rough, especially if the valve head is of steel. The compression of the motor becomes bad, and the valve has to be ground. In the first place, be careful to mark the valve that has to be ground. Remove the cap, split pin, and spring. Take some No. 000 powdered emery and make a paste of it by mixing it with some petrol; oil should not be used to make the emery paste, as this makes the work of grinding more laborious and gives less satisfactory results. Put some of the paste on the part of the valve bearing on the seat, place the valve on the seat, and by means of a screw-driver blade fastened in a drill crank turn back and forth, being careful not to press too hard on the crank, especially in the beginning. Lift the valve every now and then with the left hand, and do not stop grinding until the emery does not cut any more. Clean the seat and the valve; put on some more of the paste, and recommence the operation until the roughness has completely disappeared. The surface thus obtained should be quite uniform, but not shiny.

If during the grinding one presses too hard on the valve, as I have often seen done, the emery, instead of acting on the whole surface, is forced into certain places. Part of the valve seat becomes free from emery, and we then have two metallic surfaces rubbing one against the other. The seat, which is of cast iron, is the hardest, and one may soon see a circular line of high polish appearing on the valve, which gradually broadens up, and finally disappears. Another part of the valve, either higher or lower, succeeds this one in a little while, and also disappears, the faster the greater the pressure. The same effects are constantly reproduced as long as one keeps on grinding in this way. After some time it may be found that the valve stem abuts against the lifting lever. The stem has then to be filed to obtain the necessary play between the stem and the lever. The thickness of the valves is also reduced, and may be diminished to such a point as to be unable to obviate the escape of the charge on compression.—A. Oulion in *La Locomotion Automobile*.

WORK is being pushed forward on the steam motor-cars that are to be used for the post-office collection service in Boston, U.S.A., and three of them are expected there by the end of this month. A fourth will follow later.

THE *Revue Scientifique* reports the conclusion of the French Generals who used motor cars during the last manoeuvres, and according to this interesting evidence the cars were as successful in hilly districts as on flat roads. The trials proved that good petrol cars can be used under all conditions when steered by intelligent and experienced drivers.

In New York, none seem to take so kindly to the motor-vehicle for delivery purposes as have the florists, the most expensive conveyances of the delivery type being used by them. The Electric Vehicle Company, of Hartford, Conn., have lately built an electrical van for Messrs. Thorley, of Broadway, New York, which will carry a load of 600 lbs. besides the driver and attendant. The running radius of the vehicle is twenty-five miles on one charge of the batteries, and it can attain a speed up to eleven miles per hour.

THE FRENCH MOTOR-CAR EXHIBITION.

(From Our Own Correspondent.)

(Continued from page 878.)

LA COMPAGNIE PARISIENNE DES VOITURES ELECTRIQUES (Systeme Krieger) Boulevard Haussmann, Paris, had on view a number of electrical vehicles, but as some of these were described in a recent issue, I will confine my remarks to the new type of small carriage, known as the "Electrolette," the Company have introduced. This little vehicle weighs 760 kilogs., and the weight of the batteries is 360 kilogs., or about 60 per cent. of the total weight of the carriage, which the maker claims to be the lowest ratio yet obtained in an electric vehicle. The two motors, each of 3 h.p., are suspended in front of the fore axle, and are geared directly on to spur wheels bolted to the spokes of the front wheels. It is said that the placing of the motor in the front facilitates the starting of the vehicle. The capacity of the battery of Fulmen accumulators is from 100 to 110 ampère hours. M. Krieger states that his new car will run nearly seventy miles on a single charge of the battery.

FIG. 1.—THE GOBRON-BRILLIÉ 8-H.P. TONNEAU.
(See issue February 2, page 867.)

A light spider of quite new design was shown by Les Etablissements Cambier, St. Maurice, Lille. The underframe is of tubular construction, the tubes being electrically welded, by which it is claimed that the maximum of strength is obtained. The single cylinder horizontal motor of from 5 to 6 h.p. is placed in front of the vehicle; it is air-cooled, ribs of very large surface extending its whole length, as well as on the cylinder end. The motor runs at 1,200 revolutions, and a belt from a pulley on the motor-shaft operates a fan in front of the motor at three times the speed. The exteriors of the valve chamber are also ribbed. It is claimed that with these precautions the engine will run indefinitely without the temperature rising to any appreciable extent. The transmission is by pulleys and belts to the countershaft, which is geared on to the driving axle through the medium of the change-speed gear, the latter giving four speeds forward and reverse motion. The engine is cut from the transmission by releasing a jockey pulley running on the belt.

M. A. Korn, Boulevard Voltaire, Paris, staged a couple of voiturettes, each propelled by 6 h.p. water-cooled Aster motors, and with ordinary spur wheel transmission.

La Société d'Automobiles de Bergerac (Dordogne) has on view a couple of light carriages—a double phaeton and a spider. They are propelled by 5 h.p. Aster motors, and the transmission consists of the ordinary change-speed gear with a central chain from the countershaft to the rear axle.

The cars of Messrs. Vinot and Deguingaud, Quai National, Puteaux, have already been described in the *Journal*, so that I need only mention that they exhibited two excellent cars—one a *tonneau*, the other a spider. They employ a vertical two-cylinder motor, developing $5\frac{1}{2}$ h.p., and running at from 750 to 800 revolutions per minute. The transmission is by spur wheels and chains. The change-speed gear, which is adapted to give three speeds forward and reverse, is composed of two trains of loose wheels operating on the fixed wheels, and working by

different movements of a hand lever. The lever moves in two guides—an upper and a lower one—and each movement acts upon one or other of two rods connecting with the sliding shafts. The advantage claimed for this arrangement is that the driver has not to graduate the movement of the lever, but pushes it backwards and forwards as far as it will go in the segment for each speed and reversing.

Les Ateliers de Construction Mécanique l'Aster, Boulevard Carnot, Saint Denis (Seine), exhibited several quadricycles fitted with their well-known motors, in which there are several noticeable improvements, among which may be mentioned a change speed gear and a clutch, operated by one lever on the top bar, the forward movement giving the high speed, the middle throwing out the motor, and the back movement gearing on to the low speed. The motor is water-jacketed, and develops $3\frac{1}{2}$ h.p., its weight being from thirty-nine to forty kilogs. The chain and pedals have been suppressed, and foot-rests are fixed instead. The water-tank behind the seat has a capacity of twelve litres, and the petrol tank, carrying six litres, is suspended from the top tube so as to prevent the petrol from being heated by the warm water-tank after the motor has been running some time.

Messrs. Linzeler and Co., Rue de Laborde, Paris, exhibited the Jametel variable-speed gear, which is a modification of the sun and planet system. The firm also make a speciality of water jackets for the combustion chambers of air-cooled De Dion and Aster Motors.

A car fitted with a Bouché two cylinder horizontal motor of 8 h.p. was shown by M. Penelle, of Avenue Theirs, Melun. A special carburettor is employed into which the petrol is admitted by drops on to a hot plate, so that there is never any liquid in the carburettor, and only just sufficient gas for a single charge. The admission of petrol into the carburettor is regulated by the motor itself, according to the rate of running. The speed can be varied between 600 and 1,000 revolutions by advancing the ignition and by throttling the admission into the cylinders. The transmission is effected by a single belt, spur wheels, and chains. All the parts are accessible, and the car appeared to be very strongly made.

La Compagnie des Automobiles et Cycles Hurta, Rue de Villiers, Neuilly-sur-Seine, showed a new 12 h.p. carriage designed to carry four persons. The engine is of two-cylinder type, and the transmission is effected by means of a friction clutch and cog gearing. Four speeds and reverse are provided. The company also exhibited a carriage built upon their old Benz system, and the remainder of the vehicles shown were of the

FIG. 2.—THE HURTA SPIDER VOITURETTE.

type which created so much interest at the Champs de Mars section of the Exposition Universelle, carrying De Dion motors. The transmission in these new vehicles is effected by means of a universal jointed shaft and spur wheel gearing. The steering spindle and levers are also arranged in the same way as the De Dion voiturette. The weight of this little car is 380 kilogs.

M. Roch-Brault, Rue Saint-Ferdinand, Paris, exhibited a number of carriages constructed by Dechamps, of Brussels. The newest type is a brake weighing 600 kilogs., and propelled by a $6\frac{1}{2}$ h.p. motor. The other vehicles on this stand comprised a *tonneau* and two light cars.

La Société des Automobiles Reyrol, Levallois-Perret (Seine), exhibited several little cars, the feature of which is claimed to be that there is an entire absence of complication. Power is supplied by a 5 h.p. Aster motor, while the transmission is by a couple of belts—one for the forward drive, giving two speeds, and the

FIG. 3.—THE REYROL 5 H.P. VOITURETTE.

other for reversing—the countershaft being geared directly to the rear axle by spur wheels. The belts are long and run on small pulleys. Steering is controlled by a hand wheel on a vertical standard.

A number of Cyclope two-cylinder motors and a light three-seated car were to be seen on the stand of Messrs. Daniel Augé et Cie., Levallois-Perret (Seine). The motor runs at 750 revolutions a minute, and develops 5 h.p., but the firm are also making motors of 8 h.p. The motor is fixed either horizontally or vertically to suit the requirements of buyers, and transmission is effected by a belt to the countershaft carrying the change speed gear, which is arranged for three speeds forward and a reverse motion. From the countershaft the usual chains and chain wheels convey the power to the rear wheels. Inclined wheel steering is fitted.

La Sirène Cie., Avenue de la Grande Armée, Paris, had on view four of their voiturettes, which are too well known to need a lengthy description at this time. It may be mentioned, however, that they are propelled by a two-cylinder motor, which, running at 800 revolutions a minute, develops 5 h.p. The vehicles are steered by an inclined wheel, the standard of which also carries the various levers. Two brakes are provided, one acting by a pedal on the transmission shaft, and two hand brakes on the rear hubs operated by a lever.

A curious three-wheeled car (Fig. 4.), somewhat on the lines of the Victoria Combination, was shown by J. de Boisse, Rue de Chanzy, Paris. The head tube of the vehicle carries an inverted cone, to which are bolted extensions to form the bed of the motor, and the whole rests on a bridge supported by the axle of the front wheel. The motor is a 2½ h.p. De Dion. Power is transmitted by a chain to a short shaft geared on to a

FIG. 4.—THE BOISSE-LEVASSOR VOITURETTE.

pinion on the front wheel hub, a friction clutch and two-speed gear being provided. The whole of the propelling mechanism, of course, moves with the front steering wheel. The voiturette is constructed upon what is known as the Veuve Emile Levassor et J. de Boisse system, and the maker claims that the placing of the machinery over the front wheel facilitates steering and prevents the car from overturning. The vehicle complete weighs about 3 cwt.

Considerable attention was bestowed to the stand of M. R. d'Equevilly, Avenue de Wagram, Paris, who exhibited a petrol motor in which an attempt has been made to neutralise the difference in temperature between the admission and the exhaust by arranging the valves concentric in the centre of the cylinder end, thus forming what is practically a tube which admits the cold gases, while around it escape the products of combustion. It is claimed that the valves cannot get hot while they are kept at something like an even temperature by the cold gases. Another advantage claimed for the arrangement is that the valves are made very large, and the exhaust passes directly out and ensures a rapid and thorough clearance of the combustion chamber. The 4 h.p. motor exhibited, running at 1,500 revolutions per minute, will, it was stated, run a whole day in a closed workshop with no other cooling than that which is provided by the radiating ribs.

There are several interesting features about the cars exhibited by Messrs. Vilain Freres, of Rue de l'Atlas, Paris. The vehicles are all built with independent frames, so that any type of carriage body can be fitted, Fig. 5 showing a *tonneau*. Power is supplied by a two-cylinder horizontal motor which runs at about 600 revolutions per minute, and develops 6 and 8 h.p. The carburettor is of the mechanical type, with admission into the cylinder by tappet and valve upon the hit and miss principle. A useful feature of the motor is the automatic lubricating box, which is placed above the cylinder, and is operated from the motorshaft. Once the lubricator is filled no further attention need be paid to the oiling of the engine parts for a considerable time. The water circulation is maintained upon the thermo-siphon system,

FIG. 5.—THE VILAIN TONNEAU.

no pump being used. The silencer is composed of two round plates bolted together and separated by porous material. The exhaust pipe is connected with the centre of this hollow disc, and the burnt gases are forced out through the fibrous packing. The transmission mechanism is on novel lines; the motorshaft is geared directly on to the countershaft, which carries a drum at each end, inside of which are a couple of friction cones. These cones give the throwing-out motion; two changes of speed and reverse motion, intermediate speeds being obtained by varying the ignition. The drums are connected with pulleys on the rear driving wheels by belts, but, if desired, these can be replaced by pinions and chains. Wire or wooden wheels can be fitted, while the steering is controlled by an inclined hand wheel.

The Société des Automobiles de Riancey, Levallois-Perret (Seine), had on view one of their well-known types of small carriages, propelled by a single-cylinder horizontal motor, placed transversely in the fore-part of the frame. The 5 h.p. engine comprises one cylinder, with two pistons. Three speeds and reverse are provided.

A neat two-seated voiturette was shown by Messrs. Laurent and Co., of Route de Paris, Vierzon (Cher). It is propelled by a two-cylinder vertical motor which, at 900 revolutions per minute, develops 5 h.p. The motor is fitted with electrical and tube ignition. The variable-speed gear, arranged for four speeds and reverse by one lever, is always in mesh, the loose wheels being keyed as desired by clutches. Power is transmitted to the rear axle by a universal jointed shaft. Steering is controlled by an inclined wheel, while the underframe is built of channel steel.

The little car known as "La Plus Simple," and illustrated in the *Journal* some months ago, was shown by M. R. Legros, of Fécamp (Calvados). A $4\frac{1}{2}$ h.p. single cylinder vertical motor in front acts directly on the change speed gear arranged for two speeds, and power is transmitted to the rear axle by a belt. As the motor is thrown out of gear by a clutch, and there is no necessity for shifting the belt on to loose pulleys, the maker claims that it will last indefinitely and give no trouble through slipping, while he further states that the cost of up-keep for such a vehicle is extremely small. M. Legros also exhibited an electric car constructed on the Legros-Meynier system.

A two-seated car was shown by Messrs. Underberg and Co. The frame is of tubular construction, and carries in the fore part a Gaillardet 6 h.p. water-cooled motor. Power is transmitted from the motor to the change-speed gear through a friction clutch, and thence to the differential on the driving axle by a shaft terminating in a bevel gear, which meshes with a corresponding bevel pinion on the rear axle. Four speeds forward and a reverse are provided. The water tank is placed behind the motor, with which it is connected by a short pipe, the water being circulated by a rotary pump. The clutch is actuated by a pedal, which also applies three band brakes—one on the shaft and two on the hubs. The reversing is also done by a pedal, which is under tension by a spring, so that the reversing gear is thrown out directly the foot is raised. The vehicle is suspended on large springs, and its weight, with hood, is between 8 and 9 cwt.

La Société Générale des Voitures Automobiles Otto, Rue Lecourbe, Paris, a concern which has for some time past been experimenting with the application of the Otto engine to road vehicles, made an excellent display of four vehicles of different types, the larger ones being propelled by four-cylinder vertical motors of 20 h.p., and the smaller ones by two-cylinder horizontal engines of 10 h.p. The transmission is by the usual system of fixed and sliding spur wheels and chains. The motors are provided with electrical ignition, but a special magnetic device can be fitted if desired. The frame of the cars is constructed of wood and steel.

Two different types of cars were shown by La Société des Moteurs et Automobiles Charles Richard, of Troyes (Aube)—a small car with a single-cylinder horizontal 4 h.p. motor, and the other, in the form of a *tonneau*, with a two-cylinder motor developing 8 h.p. The transmission is effected by a couple of belts, two speeds and reverse being provided, the intermediate speeds being obtained by regulating the motor. All the machinery is placed low down on a steel frame.

WE learn from New York that a number of prominent members of the Automobile Club of America are arranging to come over to Europe to see the forthcoming Gordon-Bennett race.

A SUM of £400 has just been voted by the Conseil-Général des Etablissements Français en Océanie to enable experiments to be made with motor-omnibuses to be run between Papeete and Taravao, Tahiti.

THE Winton Motor Carriage Company, of Cleveland, U.S.A., have sent us a copy of their latest catalogue, in which full particulars of the 1901 Winton car are given. The list also includes some interesting views of the Winton works.

AT Norwich Bankruptcy Court the examination of Hayes, Thompson, and Kahler, motor-car agents, Prince of Wales Road, Norwich, took place recently. The debtor, Frank Thomas Kahler, for whose appearance the case had been adjourned several times on account of his ill-health, was now present and said he joined the firm in the autumn of 1899. He put into the business £30, which he borrowed, and he was to have a third share of the business, which was said to be a paying concern. He did not know at the time the money was wanted for the payment of an instalment on a car. Since he had been in partnership he had put in about £9 or £10. Debtor's father also lent them £50. Bankrupt received nothing from the business, and knew hardly anything about it. He thought the failure was brought about through want of capital and bad weather. The examination was closed.

HERE AND THERE.

IN answer to "A. C.," Holt's Viameter can be obtained from the Daimler Motor Co., Ltd.

WE understand that the Ariel Motor Company, Limited, of Birmingham, have decided not to proceed with the construction of motor-voitures.

MOTORISTS touring towards Land's End will be glad to know that motor spirit can always be obtained from Mr. Wm. Prockter, of Launceston.

THE Earl of Clonmel is reported to have purchased a "few automobiles" in New York recently, with the object of going in for racing on this side of the Atlantic.

"A MOTOR Field Battery" is the subject of a paper by Major H. A. Bethel, R.F.A., in the January number of the *Journal* of the Royal Artillery Institution.

MR. E. M. C. INSTONE, who for the last eighteen months has been in Paris, has now returned to this country, to take up an appointment in the sales department of the Motor Manufacturing Company.

A LARGE firm of coach and cab proprietors in Sheffield are reported to be turning their attention to motor vehicles; it is stated that they are having several big cars built with a view to utilising them for excursion and other traffic.

THE Committee of the Automobile Club has agreed to grant a sum not exceeding £30 in connection with the appeal against the decision of the City magistrates, "that a motor vehicle must not be left standing unless in charge of a competent mechanic."

FOR some time past we have been cognisant of the fact that a number of electrical parcels vans were being constructed in this country, and we are now pleased to state that the first of these is now running on the streets, being labelled the Electric Parcels Express.

AT the meeting of the Executive Council of the County Council Association held on the 21st ult., the letter of the Automobile Club, which had been circulated to the County Councillors of England and Wales, was considered and it was resolved:—"That the letter do lie on the table."

THE example shown by the Waterford County Council anent the suggested visit of the Automobile Club to Ireland, referred to in our last issue, has been followed by the Waterford Corporation. At their last meeting this body passed a resolution in similar terms to that of the County Council.

WE had an opportunity the other day of going over the new motor-car depot which has just been opened in Long Acre, W.C., by the General Automobile Agency, of which Mr. D. Farman is manager. The extent of the establishment may be gauged from the fact that there is ample room for fully fifty cars. The garage will be open day and night, and arrangements are being made for washing and repairing the vehicles of motorists.

IN order to afford to members of the County Councils of Worcestershire, Warwickshire, Gloucestershire, Herefordshire, Staffordshire, and Shropshire an opportunity of gaining, from personal experience, a knowledge of the control which the driver of an automobile has over his vehicle, the committee of the Automobile Club of Great Britain and Ireland are making arrangements for a demonstration at Worcester on Saturday, the 16th inst., and Monday, the 18th inst. A number of cars will assemble at the County Hall, Worcester, at 11 a.m. and 2 p.m. on these two days.

MR. J. CARMICHAEL FERRAL, J.P., Augher Castle, arrived at Tynan from Dublin on Thursday last week with a motor-car in charge of an engineer. After dark a start was made for home, but when a few miles had been covered, a thick mist came down, with the result that the car ran into the water-table between the roadway and the tram lines at Crilly station. The water-table at this place is nearly a foot deep, and it is a miracle that the car did not overturn. The car, after being righted, was abandoned for the night, Mr. Ferral and the *mécanicien* walking to Aughnacloy, where the latter stopped, Mr. Ferral proceeding home by car. The motor-car passed through the town on Friday and attracted much attention.

THE SALSBUURY-BLERIOT MOTOR LAMP.

MESSRS. SALSBUURY AND SON are now marketing the Salsbury-Bleriot lamp for automobile purposes the new system of acetylene gas lighting which has during the past few months been exciting much attention among automobilists and the owners of public vehicles of all classes. It is a light upon a new principle, which appears likely to revolutionise the present system in many important particulars. The lamp (Fig. 1) gives a very powerful light, which is said to be unaffected by the roughest roads, no matter how great the speed at which the car is travelling. It is supplied either to work from a small separate generator or the generator can be contained in the lamp.

The acetylene gas is generated from a special kind of carbide called "Acetylithe," which is unaffected by the ordinary moisture of the atmosphere. It is only when it is directly attacked by water that the acetylithe generates gas, and directly

FIGS. 1 AND 2.

the water is removed from the acetylithe the gas generation ceases. Advantage is taken of this in a very ingenious way. For the purpose of showing how the system works we give in Fig. 3 a section of a large generator on the Salsbury-Bleriot

FIG. 3.

principle. The generator, which is the same as contained in the motor lamp, consists of a water container and a charge box. The charge box works on the principle of the diving bell, and it

somewhat resembles a bell in shape. The lower part contains acetylithe, the upper part is the gas chamber and the purifying chamber. The bell is immersed in the water with the gas tap closed, the water container being partly filled with water so as to leave a space at top for the water to rise, as explained later on. The water works up through the perforations at the bottom of the bell and attacks the acetylithe, which, immediately it comes into contact with the water, commences to generate gas, which passes through the bulk of the acetylithe to the gas chamber on top. Very soon gas is generated in a sufficient quantity to exert a pressure greater than the weight of the water. This pressure forces the water back away from the acetylithe, leaving it quite dry, and the water rises outside the bell as it is displaced by the gas pressure. The water being removed from the acetylithe gas ceases to generate. Now the gas tap is turned on and the gas lighted. As the gas is consumed the pressure on the water is relieved, and it returns and rising again attacks the acetylithe. When the pressure of gas again exceeds the weight of the water, it forces the water away from the acetylithe once more, and so the process goes on, automatically maintaining a uniform pressure of gas in the gas chamber.

Another ingenious feature of the system is the way the purification of the gas is carried out. It is well known that ordinary carbide will absorb moisture, and that cotton wool arrests small particles of grit. The moisture and grit with which acetylene gas is charged generally acts so as to clog the burners of ordinary acetylene lamps. In the Salsbury-Bleriot the purifying chamber is filled with ordinary carbide between two wads of cotton wool, and the gas passing through these is cleaned of all moisture and impurities, so that the burners cannot get clogged.

Large numbers of motor lamps have already been delivered, and are, we understand, working perfectly satisfactorily, while the generator system has been installed in a number of public vehicles with good results. Fig. 2 shows the outward appearance of the generator and the cartridge, which has only to be dropped into the charge box or bell, and the system is ready for use. Owing to the perfectly automatic action of the system the charge can, it is stated, be left in the lamp for days without deteriorating.

HECNUM METAL.

HECNUM metal, well known in the form of hubs, pedals, etc., on account of its great strength and non-corrosive qualities is beginning to attract considerable attention in the motor industry. Amongst other things it is being introduced in the form of motor valves with marked success. Hecnum appears to withstand

heat and acids better than anything else for this purpose and keeps clean, thereby saving much trouble in grinding-in, qualities that cannot fail to be appreciated. Ignition tubes of Hecnum are also being substituted for platinum with very satisfactory results, and the firm anticipate an important business in both these lines.

ARRANGEMENTS had been made to run off a motor-cycle race near Barcelona, Spain, a few days ago, but at the last moment the governor of the province issued instructions that the race was not to be permitted.

THE Watch Committee of the Eccles Town Council have inspected a motor-car to carry fire-extinguishing apparatus and four or five men for the fire brigade, and have further postponed the consideration of the matter.

THE AUTOMOBILE CLUB'S ANNUAL GENERAL MEETING.

THE annual general meeting of members of the Automobile Club and of the Automobile Proprietary, Ltd., was held at the Club premises on Thursday, the 28th ult., Mr. Roger W. Wallace, K.C., in the chair. The annual report of the Club for 1900, as approved by the Club Committee, and accounts of the "1,000 Miles Trial of 1900," and the accounts and balance-sheet of the Club for the year 1900, as audited by Messrs. Andrew Barr and Co., were submitted.

The annual report showed that the membership at the close of 1900 was 710, as compared with 586 on January 9th of the same year; subsequent additions have increased the total to 756. The report further stated that the Club had been in communication with the Local Government Board with reference to the proposals which had been made to County and Rural Councils as to the imposing of further restrictions on the use of automobiles. An important letter, consisting of twenty-six pages of printed matter, had been sent to 4,412 County Councillors in England and Wales, protesting against these proposals. A warning had been issued by the Club to automobilists concerning the non-compliance with the law as to stopping when signalled to do so by the driver of a restive horse; and a letter on the same subject had been addressed to all County Chief Constables. A sub-committee was appointed to deal with the railway transport of petroleum spirit, and recommendations were made to the Home Office with satisfactory results. Four tours, apart from the 1,000 Miles Trial, had been held, covering a total of 1,196 miles. Three 103-miles trials and trials of electrical vehicles had also been held. The Committee had also approached the War Office with a proposal for the formation of a corps of Automobile Volunteers, and it appeared probable that this corps would be formed. The Club had been successful in getting the tolls for motor-carriages reduced by the authorities of Dulwich College, Durham Bridge, and Maidenhead Bridge. During the present year the most important work of the Club was likely to be directed towards the conversion of those who were seeking to bring about the imposition of further restrictions on the use of motor-vehicles.

In submitting the accounts of the 1,000 Miles Trial, the Chairman pointed out that the trial had not necessitated any call whatever on the funds of the Club. It had been originally estimated that the Club should be paid £250 from the Trial Account for use of offices and the permanent officers of the Club. As a matter of fact the trial account had only paid the Club £133. But against the £117 balance, there was the consideration of the advertisement the Club had obtained by sale and distribution of the programme of the trial, the public functions and the flags throughout England and a part of Scotland. He thought the trial had been the means of establishing the Club. He was glad, at a recent meeting, to hear representatives of manufacturers, who took no part in the administration of the Club, state that they thought that the trial had been the best and cheapest advertisement possible to manufacturers. The accounts of income and expenditure of the Club for 1900 showed a deficit of £70. The report was adopted.

The Budget for 1901 was submitted and adopted, and the Chairman explained that when the Motor Union is organised it would be necessary to pay over to it a sum representing 7s. 6d. per member, and at the same time the Motor Union would relieve the Club of certain expenditure.

The following members were elected as the new Club Committee for the ensuing year:—Mr. Worby Beaumont, Mr. W. C. Bersey, Mr. Alfred Bird, Professor C. Vernon Boys, F.R.S., Mr. T. B. Browne, Mr. Frank Butler, Mr. R. W. Buttemer, Mr. E. Calthrop, Mr. C. Cordingley, Colonel R. E. B. Crompton, R.E., Mr. Bryan Donkin, Captain the Hon. Cecil Duncombe, Mr. Henry Edmunds, Mr. T. W. Staplee Firth, Mr. J. M. Gorham, Mr. Walter Hancock, Mr. H. E. Sherwin Holt, Professor H. S. Hele-Shaw, F.R.S., LL.D., Major H. C. L. Holden, R.A., F.R.S., Mr. H. A. House, Mr. Ernest Hutton, J.P., Mr. A. H. Howard, Sir Edward G. Jenkinson, K.C.B., Mr. Edward Kennard, Mr. John Henry Knight, Mr. W. J. Leonard, Mr. Edmund Macrory, K.C., Mr. Edward Manville, Mr. Mark Mayhew, L.C.C., Sir Hiram S. Maxim, the Hon. John Scott Montagu, M.P., Mr. C. Harrington Moore, Mr. Richard Muirhead, Mr. Arthur Paget, Mr. Robert E. Phillips, Dr. Boverton Redwood, D.Sc., F.R.S.E., the Hon. C. S. Rolls, Sir David Salomons, Bart., Mr. Lyons Sampson, the secretary of the Cyclists' Touring Club (*ex-officio*), Mr. Frederick R. Simms, Mr. Paris Eugene Singer, Mr. Shrapnell Smith, Mr. Stanley Spooner, Mr. Henry Sturme, the Right Hon. Lord Suffield, K.C.B., Mr. John I. Thornycroft, F.R.S., Mr. Roger W. Wallace, K.C., Mr. Arthur J. Walter, and the Club Secretary (*ex-officio*).

Certain alterations in the rules with regard to the appointment of the General Council were then dealt with and adopted.

An extraordinary general meeting of the members of the Automobile Club was afterwards held, when certain alterations in the rules as to affiliated clubs were considered and adopted, as was also the proposal to form a Motor Union, details of which are given on another page.

AN electrical motor-tricycle is, we hear, being constructed by Mr. J. T. Kellet, of Stockwell, S.W.

THE Salon Automobile Belge will open in Brussels on the 16th inst. and close on the 24th inst.

THE *Velo's* correspondent at Nice reports that the Crown Prince of Sweden and Norway is going to make the trip from Paris to the Riviera on a 24 h.p. motor-car.

THE MOTOR UNION.

SINCE the formation of the Automobile Club the necessity for a combination of automobilists for the protection of the individual and opposition to attempts to bring about unnecessary restrictive legislation has daily become more apparent. The work of the Club has to a large extent been in these directions, with the result that the attention which has necessarily been given to these important matters has probably, in some measure, impaired the social functions of the club. In order to present an effective front to opposition, to foster the movement, and to properly protect the individual, the Club Committee hold the opinion that it is indispensable that all automobilists should be embodied under one banner. At an extraordinary general meeting last week, the formation of a Motor Union for this purpose was proposed and adopted.

The functions of the Union will be (1) to absorb and perform the work hitherto carried on by the Motor-Vehicle Users Defence Association, namely, the protection of individual automobilists against unnecessary or vexatious actions at law.

(2) To carry out the work hitherto entrusted to the Competitions Committee.

(3) To empower and enable the A.C.G.B.I. to set up effective opposition to attempts at unnecessary restrictive legislation.

(4) To empower and enable the A.C.G.B.I. to take such action as may be necessary to uphold and extend the rights and privileges of automobilists generally in the United Kingdom.

(5) To assist the A.C.G.B.I. in carrying out tests, trials and exhibitions which may be organised from time to time for the advancement of the industry.

(6) To advise and assist the A.C.G.B.I. in the provision of special facilities for automobilists in the United Kingdom, such as the appointment of hotels and repairers and the provision of petroleum spirit depôts.

(7) While maintaining the A.C.G.B.I. in its position as the recognised authority on automobilism in this country to relieve that body of the burden of the work hitherto carried out by it for the general advancement of automobilism as opposed to the purely social functions of the club.

Any person, lady or gentleman, may become a member of the Motor Union on payment of the subscription, without election, subject to the right of the Executive Committee to cancel the enrolment of a member at the end of any year. The subscription will be one guinea per annum, except for members of the A.C.G.B.I. and members of Automobile Clubs in the United Kingdom affiliated to the A.C.G.B.I., who will *ipso facto* be members of the Motor Union.

The following are the privileges of Membership.—(1.) Membership of a body which has as its object the advancement of automobilism in the United Kingdom.

(2) Defence: Every member of the Union shall have the privileges at present enjoyed by members of the M.V.U.D.A., namely, the right to have considered his claim for the necessary financial and legal assistance in respect of proceedings or actions at law, either civil or criminal, in connection with their motor-vehicles.

(3) A free copy of the Automobile Club *Notes and Notices*, the columns of which will be employed as a means of informing members of the Union of the proceedings of the Automobile Club and of the Union, and as the medium of inter-communication between the members of the Union.

(4) The right to apply to the Executive Committee for advice in connection with automobile matters.

(5) The right to wear the badge of the Motor Union.

The income of the Union will consist of:—

(a) Subscriptions of members of the Union who are not members of the A.C.G.B.I. or its affiliated clubs.

(b) 7s. 6d. to be paid by the A.C.G.B.I. in respect of every member of the latter.

(c) 5s. to be paid by the A.C.G.B.I. in respect of every member of affiliated clubs.

(d) Voluntary subscriptions by owners of motor vehicles and others.

The administration of the Union to be in the hands of the Executive Committee, which shall be composed as follows:—

(a) The Administrative Committee of the A.C.G.B.I. *ex-officio*.

(b) Two *ex-officio* representatives of the Committee of every affiliated club.

(c) Two elected members for every hundred members of the Union on the register of the A.C.G.B.I. The election of these representatives to take place at the annual general meeting of members of the Union on such a register.

(d) One elected representative for every fifty members of the Union on the register of a club affiliated to the A.C.G.B.I. The election to take place at the annual general meeting of members of the Union on such a register.

(e) The chairman and vice-chairmen for the time being of the A.C.G.B.I. to be *ex-officio* chairman and vice-chairman of the executive committee of the Union.

(f) The executive committee of the Union shall have power to delegate portions of its work to sub-committees composed of members of the executive committee.

The liability of members of the Union will be limited by registration under the Company's Act to the amount of their subscription.

THE DUNLOP COMPANY AND TIRES FOR HEAVY AUTOMOBILES.

THE users of heavy motor vehicles in this country have for some time suffered severely owing to the fact that the Dunlop Pneumatic Tire Company, whilst unable to supply English-made tires for use at high speeds on the heavier class for motor passenger vehicles, have refused to allow the importation of the Michelin tire which is made in France, and which has been considered up to now the best heavy motor vehicle tire, even though British automobilists have been willing to pay a heavy royalty to the Dunlop Tire Company in connection with these tires. Representations were made to the Committee of the Automobile Club that the action of the Dunlop Company in this matter was seriously impeding the development of automobilism in this country. The Automobile Club Committee therefore asked the Directors of the Dunlop Pneumatic Tire Company to consent to a Conference on this question with a sub-Committee of the Club, composed of Mr. Roger W. Wallace, K.C.; Sir David Salomons, Bart.; Colonel Crompton, R.E.; the Hon. C. S. Rolls; and Mr. Mark Mayhew, L.C.

It appears, however, that for some time past the Dunlop Company have been endeavouring to overcome certain difficulties which surrounded the sale of Michelin tires, and on the 1st inst. Mr. Harvey du Cros, the chairman of the Dunlop Company, most courteously communicated to the secretary of the Automobile Club particulars of these negotiations, and of the arrangement which has now been come to. It appears that the Dunlop Company had been in the habit of making their tires for bicycles by hand, and hoped to use the same process for the manufacture of heavy motor-vehicle tires. This proved to be unsatisfactory, and it was found that in order to make heavy motor tires it would be necessary to use a vulcanising process, which entailed in the first place that the Company should become rubber manufacturers, and in the second place that they should put up extensive buildings and purchase very expensive machinery. The demand for heavy motor tires was not at the outset sufficient to justify this expenditure. The Company, therefore, decided to import from France heavy motor tires which, by many users in France, were considered to be almost satisfactory, if not quite as satisfactory, as Michelin tires. Pending the erection of the new factory, it was not considered advisable to inform the public that the heavy tires sold to them by the Dunlop Company were of foreign manufacture. It should be clearly understood, therefore, that the Dunlop Company had never made a pneumatic tire for heavy motor vehicles.

Many motorists had asked them to permit them to import motor tyres on the understanding that they should pay to the Dunlop Company a royalty. An agreement to this on behalf of the company was rendered impossible owing to the fact that the company was under obligations to other licensees. There were also considerations which made it undesirable for the Dunlop Company to arrange direct with Messrs. Michelin. But for some time past Mr. Harvey du Cros, being extremely anxious that nothing should stand in the way of automobilism in this country, has been endeavouring to arrive at an arrangement whereby the Clipper Tyre Company will be permitted to have their tires manufactured for them by Michelin, of Paris, for sale in this country. The first difficulty which presented itself in connection with this proposal was that the Clipper Tyre Co. had given an "undertaking" to deal with another company, and Mr. Harvey du Cros said that the surmounting of these difficulties has only been brought about at considerable sacrifice. The terms asked by Messrs. Michelin in connection with the manufacture of tires for the Clipper Co. were at the outset prohibitive. Among the terms of the proposed contract were the following, viz. :—

- (a) Michelin to give the Clipper Company sole rights for Great Britain and Colonies.
- (b) The Clipper Company to sell no other tire.
- (c) Michelin to give no guarantee as to delivery or quality.
- (d) The Clipper Company to guarantee a turnover of £80,000 during the second year: £100,000 during the third and following years.
- (e) The Clipper Company to make a deposit in a French bank of £8,000 cash as a guarantee to Michelin of the carrying out of agreement.
- (f) The Clipper Company to order the entire £80,000 of tires at one time and to pay in advance.

The acceptance of these terms being absolutely impracticable, the arrangement of the contract has necessarily caused considerable delay. Mr. Harvey du Cros, however, authorised the Secretary of the Automobile Club to say that Clipper Tires manufactured by Michelin will be sold by the Clipper Company at prices hitherto charged for Dunlop tires. The Clipper Tire Company will sell nothing but these tires. All the tires to be specially marked at the London Depot of the Clipper Company, of which Mr. Jarrott is to be the manager. Automobiles purchased in France for use in the United Kingdom may be fitted with similar tires obtained from the Clipper agents in Paris, viz., Clément-Gladiator Company; but the purchase of tires from Michelin otherwise for use in England will be prohibited and the users of such tires will be proceeded against with even more rigour than hitherto.

In the meantime, the Dunlop Company have for some time been engaged in the preparation for the manufacture of heavy motor tires in this country; the Company has become rubber manufacturers, has put up extensive works, and has bought the necessary plant for the proper manufacture of motor tires for large high-speed cars in this country. The Company, however, will not sell heavy tires of their manufacture

until they are satisfied that they have secured the same high efficiency as that established for their cycle and voiturette tires, but they believe that they will arrive at this stage in relation to heavy tires very shortly. In the meantime, Mr. Harvey du Cros emphasises the statement that up to now neither the Dunlop Company nor the Clipper Company has ever made heavy motor-vehicle tires.

NOTE.—The above statement has been submitted to the chairman of the Dunlop Pneumatic Company, and has been corrected by him. In publishing it the Automobile Club Committee wish it to be understood that they cannot take any responsibility for the assertions or opinions contained in the statement.—*Automobile Club Notes.*

LEAVING A MOTOR-CAR UNATTENDED.

AT the City Police Summons Court last week, Mr. D. M. Weigel appeared to a summons for leaving a light locomotive without a competent person in charge. Police-constable James said that he saw the motor-car in Gresham Street; no one was in charge. He stood by it for nearly an hour. Then he made inquiries, and shortly afterwards the defendant came out of an office near by. Defendant's solicitor contended that it was absolutely essential to the proving of an offence that the machine should be in actual use. Not only was it impossible for the motor to be in use while he was away, but under no circumstances whatever could it be used, as at the time stated the defendant had in his pocket the mechanical appliance that united two wires which caused an electric spark to ignite the gas in what was technically known as the explosion chamber. Had they been summoned for obstruction he would have had to meet the case very differently. At the same time the car, which was a very small one, could easily be pushed out of the way. Defendant went into the box, and gave evidence which satisfied Mr. Alderman Smallman that the words "in use" did not apply in the present case. At the same time, the Alderman said, it was a technicality the police could not be expected to know. Defendant's solicitor said the case was highly technical, and highly important to motorists, and, if it were construed that the motor was actually "in use" when it was left by the owner outside any place, it would mean that they must take engineers with them. The Alderman ordered the summons to be dismissed.

La Course du Catalogue, which was to be run off last Sunday, had to be postponed owing to wretched weather. It will take place on Sunday next, the 10th inst. About forty entries have been received.

THE Aberdare Valley Motor Service Company, Limited, Gloucester Street, Aberdare, have been appointed official repairers to the Motor Manufacturing Company, Limited, and De Dion-Bouton, Limited.

THE Gesellschaft für Motorfahrzeugbau, Cudell and Co., of Aix-la-Chapelle, has issued its balance-sheet for last year, which shows a net profit of £5,702, out of which a dividend of 4 per cent. is being declared.

JOHN WANAMAKER'S two stores—at New York and Philadelphia—have started to sell motor-tricycles and quadricycles on the time payment plan. These machines are sold at the regular list price, plus interest at the rate of 4 per cent. per annum on the unpaid part.

MR. JOHN D. HILL, of Finsbury Park, writes that in giving the list of cars present at the demonstration before the County Council at Chelmsford, in our last issue, we stated that his 8 h.p. Panhard car was Mr. F. F. Wellington's 6 h.p. Panhard. The mistake arose owing to the fact that Mr. Wellington drove Mr. Hill's car.

THE Touring Committee of the A.C.F. have decided that in order to preclude any idea of a speed contest between the participants in the tourists class in the Paris-Berlin race, they shall not be timed except at the start from Paris and the arrival at Berlin. Moreover, the tourist class will not follow the same route as the racing contingent.

THE British Automobile Commercial Syndicate, Limited, has been registered with objects sufficiently indicated by the title. The capital is £15,000, divided into £1 shares. The subscribers are Mr. E. P. Daniell, 259, Ladbroke Grove, Notting Hill; Mr. A. Vahid, 259, Ladbroke Grove, Notting Hill; Mr. S. Lombardi, 36, North Road, Highgate; Mr. R. Proto, 53, Paul Street, Finsbury; Mr. B. Weigel, 25, Maxilla Gardens, North Kensington; Mr. F. Strudwick, 6, Loris Road, Shepherd's Bush; Mr. S. Weiner, 25A, Hatton Garden, E.C. The first chairman is the Earl of Shrewsbury and Talbot.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock. Garage, Repairs.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, MARCH 16, 1901.

[No. 106.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AFTER a week of miserable weather, Saturday opened fine and bright, and the Automobile Club's initial run of the season promised to be more attractive than was first anticipated. The journey to Virginia Water being only a short one of twenty-two miles, it was not expected many would remain to dinner, consequently the small party staying behind did not cause disappointment. Outside the Club only about half-a-dozen cars were assembled at two

o'clock, and the owners of several of these only came to see the start. The journey to the "Wheatsheaf" needs no description; half the way the road consists of wood pavement and the other half macadam, the latter very bumpy, but otherwise not heavy going. At Virginia Water, where we arrived about five o'clock, there were the following cars drawn up:—a Delahaye voiturette with Messrs. Moore, sen., and jun.; Mr. Pierce, 9 h.p. Napier; Mr. Owers, Daimler, with Estcourt cooler and valves; Mr. Estcourt, Daimler, ditto; Mr. Peal and party, Daimler; Mr. and Mrs. Fuller, De Dion voiturette; Mr. Manville, with Mr. Johnson and party, Daimler—the one, by the way, used by Mr. Pitman throughout the 1,000-mile trial; a Darracq, with Mr. Bruce and party; Mr. Cordingley, Mr. Burgess and party on a M.M.C. Panhard; and Mr. J. Scott Montagu, M.P., on his new 20 h.p. Daimler. After dinner many returned to town: Mr. Montagu and party to Ditton Park; and others to Hampstead, there being no incidents either going or returning. The next afternoon run will take place on Saturday, the 23rd inst., the destination on that occasion being Sevenoaks.

The Turgan-Foy Steam Caravan "Quo Vadis."

We are this week able to reproduce a photograph taken by M. Turgan during his recent tour in Algeria and Tunis on his steam caravan "Quo Vadis." This huge vehicle is fitted up in a most complete way, there being a kitchen, sitting-room, and sleeping accommodation, etc., the various compartments being lighted by electricity. We are pleased to be able to announce that there is every likelihood of this interesting vehicle being on view at the forthcoming motor-car exhibition at the Agricultural Hall, where it is sure to create a good deal of attention.

Another End-to-End Trip.

MR. WARREN SMITH, the well-known actor and a keen yachtsman, has no doubt by this time completed his trip on an Argyll motor-car from John o'Groat's to Land's End, for on Monday he had only seventy miles further to cover. We hear that Mr. Smith, who undertook the journey in a purely sporting spirit, has had some novel experiences and many difficulties to overcome. For one hundred miles on each side of Inverness he was practically cutting his way through the snow, and we know that one day he was eight hours doing fifteen miles purely owing to the state of the roads.

Not Yet.

THE Borough surveyor of Kensington, Mr. Weaver, included in a number of proposals which he submitted to the Borough Council, in reference to an improved method of street cleansing, one that the night foreman should be provided with a motor-car, at an estimated cost of £110, to enable him to get round the borough more expeditiously at night. The Council, however, rejected the suggestion, and decided that a bicycle, at a cost of about £10, would meet the requirements of the case. The time is, however, not far distant when different views will prevail, for the economics and practical advantages of the motor-car are slowly but surely being recognised.

Brakes.

AT the present time the subject of brakes is receiving serious attention both from the Committee of the Automobile Club and from manufacturers, and a suggestion has been put forward, that unless a machine has brakes—applicable either backwards or forwards—sufficient to "pull up" the car on a gradient of 1 in 4½, it should not be allowed to take part in Club events. Such a condition we consider unnecessarily severe, but at the same time there must be borne in mind the grave risks run daily by drivers having on their cars faulty brakes, which are unable to prevent cars from travelling backwards. It should be a *sine qua non* that every car be fitted with effective and properly tested brakes, and that the dependence on sprags alone or similar devices should be discountenanced.

Some French Devices.

IN our issue of September 8th, 1899, we illustrated that Cuenod emergency brake, which is largely used by French automobilists. This brake consists of two iron shoes carried near the ground, one at each side in the space between the rear wheels. In addition to acting as a brake, the device can also take the place of a sprag. When in Paris recently we noticed still another device to replace, or rather supplement, the sprag, to prevent the car from running back when ascending hills. It consisted of a couple of large wooden wedges supported one behind each wheel. In climbing hills these can be let down on the road behind the wheels simultaneously with the sprag, this and the wedges being controlled by one lever. While it cannot be said that they add to the appearance of the car, the wedges appear to be capable of preventing all chance of the car running back in a hilly country, and the safety of the passengers is of more importance than appearance.

The Liverpool Heavy Vehicle Trials.

THE Liverpool Self-Propelled Traffic Association are busily engaged in completing the arrangements for the trials of heavy vehicles which are to take place in June next, and we understand that the entry forms will be obtainable from Mr. E. Shrapnell Smith, the hon. sec., on and after the 18th inst. The full conditions relating to the trials were published in our issue of June 13th last. Three classes of vehicles are therein provided for, but the Council, upon representations that a number of vehicles will otherwise be debarred from competing, have since

decided to add a fourth class. In this new class, to be known as "Class D," there are no restrictions upon the tare or platform area, and all the conditions published last year apply. The minimum load to be carried is four tons, but an excess may be declared in accordance with Rule 1. There is no alteration in Classes A, B, and C, the specifications for which remain unchanged. Entries will be received until the last day of April, and the Council of the Association are hoping that builders of petroleum-spirit cars for heavy traction will make a special effort to enter vehicles for the competition. A dinner in connection with the trials will be held on Monday, June 3rd.

The Darracq 80 h.p. Racing Car.

FOR some time past rumours have been rampant to the effect that many motor-car builders in France have been quietly engaged in constructing powerful machines, and in this connection it gives us pleasure to present an illustration of the Darracq racing car, which is fitted with an 80 h.p. motor and which has been built to take part in the forthcoming Paris-Berlin race. It is claimed to be the most powerful and fastest machine actually in Paris. The engine, which comprises four cylinders, is fitted with both tube and electric ignition. Lubrication is accomplished from a central box which is seen at the front of the *mécanicien's* seat. It will be noticed that the driver brakes with

both feet, and his position in the seat admits of the application of great power to the brake. The transmission is similar to that adopted in the Panhard cars; the rear wheels are shod with Michelin 5 in. pneumatic tires and the front wheels with 3 in. ditto. We are indebted to the *Automobile Magazine* for the illustration.

The C.T.C. and Motorists.

THE members of the Cyclists' Touring Club are just now engaged in a discussion as to whether the memorandum of association should be so altered that owners of motor-cars may become members of the club. How far the change may be necessary from the C.T.C. point of view we do not know, but looking at the matter from the motorists' side there is absolutely no necessity for the alteration. It has, we believe, been claimed that the requirements of both cyclists and motorists are identical so far as touring is concerned, and that motorists are largely recruited from the ranks of cyclists. While there may be a modicum of truth in both these statements, yet we believe that motorists will prefer to have their interests looked after by an automobile body purely rather than one whose primary object is that of the interests of cyclists. Were motorists unprovided with an organisation for the protection of their interests, the action of the C.T.C. might be viewed in a different light; but seeing that the users of motor vehicles have already their own organisations which are steadily working for their objects, the contemplated change by the C.T.C. is quite unnecessary.

Racing at Nice.

THE racing season at Nice has now commenced in earnest. The Brunetta d'Usseaux Cup Race was run off on the 5th inst., the route being Nice-Puget-Theniers-Nice, a distance of 128 kilomètres. There were only three starters—M. Chauchard, with a 20 h.p. car, M. Garibaldi, with M. Gondoin's 9 h.p. car, and Le Baron de Ville d'Avray. The start was given at 9.30 a.m., M. Chauchard arriving first at Puget-Theniers, the other competitors arriving five minutes later. The Baron's car broke down on the return journey, Chauchard arriving in 2 hrs. 22 mins. 3 secs., Garibaldi's time being 3 hrs. 19 mins. 3 secs. On Sunday the Lebaudy Cup was competed for, the course being Nice-Cannes-Sainte Maxime-Hyeres-Hassans-Le Luc-Nice, a distance of 280 kilomètres. Out of eight entries, only two—M. Pinson, on a 24 h.p. car, and M. Clerissy—started, so that there was little interest in the race, which was further curtailed by the fact that the latter of these retired shortly after starting. M. Pinson's time for the course showed an average speed of 34 miles per hour.

The Rothschild Cup Race.

TUESDAY was devoted to the Baron Arthur de Rothschild Cup race, a short course of nearly 9 kilometres between Nice and La Turbie for four-seated heavy cars. Out of six entries only three started, viz., M. Desjoyaux, driving a 35 h.p. car; Prince Lubecki, a 35 h.p. car; and M. Jellineck, a 28 h.p. car. The result was as follows: 1, Prince Lubecki, in 11 min.; 2, M. Desjoyaux, 12 min. 13 sec.; 3, M. Jellineck, 15 min. 23 sec. After the dinner Baron Arthur de Rothschild gave a *dejeuner* to the *chauffeurs* present.

The Automobile Club of America.

THE first run of the century, and the last from their old quarters, was undertaken by the Automobile Club of America a few days ago. Leaving the Waldorf-Astoria, in New York, at nine o'clock, over streets and roads covered with snow, eight brave members sailed forth for the Claremont. Four of the vehicles were petrol, three steam, and one electrical. Mr. A. C. Bostwick, vice-president of the club, set the pace in an electric car. The run was a great success, the snow not interfering in any way either with the running of the vehicles or the comfort of those in them.

The Lincolnshire Automobile Club.

THE Lincoln Automobile Club dinner is to take place to-day, the 16th inst. Among the motorists who have promised to attend dinner are Mr. Roger Wallace, K.C., Chairman of the Automobile Club of Great Britain, the Hon. J. Scott Montagu, M.P., Mr. S. F. Edge, Mr. C. Jarrott, Mr. J. W. Stocks, Mr. A. J. Wilson, Mr. A. R. Atkey, of the Nottingham Club, with a large party, and most probably the Hon. C. S. Rolls and Mr. C. Johnson, secretary of the A.C.G.B., with other well-known gentlemen. The guests are to be met per motor-car at Sleaford and Newark. The Mayor of Lincoln, Mr. Councillor C. W. Pennell, will take the chair.

Accumulators for Ignition Purposes.

OUR recent remarks concerning the cost of charging these in country districts are questioned by a contributor to an electrical contemporary, who is either unaware that from 1s. 6d to 2s. is not uncommonly asked for recharging a pair of 20 ampère-hour accumulators, or unable to calculate the energy contained by such, which, translated into terms more familiar to the non-electrical automobilist, is approximately that of one-tenth of a h.p. for one hour. It is obvious from this that the cost to the purchaser is not far from what we stated, theoretical ideas of the price of electrical energy notwithstanding. Our critic concludes with a brilliant suggestion for avoiding the difficulty of getting cells charged, namely, to carry one or

two spare ones. A point about electrical ignition not sufficiently appreciated yet is that to a certain extent a more energetic spark is followed by more energetic combustion. This can only be true to a certain limited degree, but there can be little doubt that in many motors the ignition appliances are cut too fine where accumulators and a coil are employed. There is a great difference between getting a sufficient spark for regular ignition and getting one sufficient to give the best results, and a little more liberality in the ignition apparatus of a motor would often be well repaid.

The English Motor Club.

THE week-end run of the English Motor Club to Ripley was favoured with a glorious day and good roads; consequently the attendance was good, and besides those who actually carried out the run to the full, there were several who took the opportunity of having a spin along the famous Ripley Road. Amongst those who reached the lunch table at the "Talbot" were Mr. A. J. Wilson, on a latest pattern De Dion-Bouton tricycle, with water-cooled head; another gentleman on a 6 h.p. De Dion-Bouton tricycle; Mr. Malthy on a New Orleans; Mr. Cousins on a racing De Dion-Bouton tricycle; Mr. Cecil Edge on a 9 h.p. Napier; Mr. S. F. Edge on a 16 h.p. Napier, accompanied by Mr. and Mrs. H. L. Clark; and Mr. C. Sangster and Mr. R. H. Fuller on a De Dion-Bouton voiturette, and Mr. Munn on a tricycle. Lord Russell and Mr. Jarrot, who started on a Panhard, experienced tire troubles, and completed the journey by other means. The Club are now concentrating their attention on their motor race meeting at the Crystal Palace on Easter Monday, which promises to be a notable fixture.

Electric Vehicles in France.

MR. HART O. BERG, of Paris, considers that the electric carriage in that country is pressing the petroleum vehicle hard, and will continue to do so. For some years past there has not been anyone who seemed inclined to take the risk of establishing central stations in the capital, which, of course, are necessary in cities where electric vehicles are to be much used. Recognising this condition, and feeling sure that the electric carriage would appeal to the Parisians, the Electric Vehicle Company have established a central station, which is equipped, not for the purpose of taking care of Columbia vehicles only, but all types of electrically-propelled carriages. This growing popularity of electric vehicles is said to be astonishing petrol enthusiasts.

Road Improvement.

At a recent meeting of the Committee of the Roads Improvement Association, it was announced that a scheme was in preparation for the extending the usefulness of the association. Now that the bicycle as an instrument of road travel is being reinforced by the motor-car, a new interest has been aroused in the maintenance of our highways, and the subject is one that requires to be kept constantly before the public, for, although many of our roads are good, the generality are nothing like what they ought to be, considering the money that is spent upon them and the ever increasing importance of locomotion facilities. The annual meeting of the Association is fixed for the 20th inst.

Fire-Engines and Automobilmism.

It is stated that the experiments of the London Fire Brigade with oil fuel which have been going on for more than a year are so far satisfactory that three more engines are to be fitted with appliances for its use on the Clarkson-Capel and another system. It may be hoped that the next advance will be in the direction of adopting a more efficient and modern means of propulsion. The self-propelled fire-engine has been tried and not found wanting in New York and elsewhere, and the forthcoming

exhibition of such appliances promised for next June at Berlin should afford an opportunity of information on the subject not to be neglected by the various bodies responsible for fire brigade management in this country.

A Striking Example.

A STRIKING illustration of the way municipal and provincial authorities in France do all in their power to encourage the automobile movement is to be found in the fact that at Poitiers a gentleman has been appointed by the municipality to give weekly public lectures on the subject of automobilism, in the town hall. The lectures will be historical, theoretical, and practical, and will, in particular, be devoted to technical explanation of different types of motors. They will also deal with the driving of cars, and the lecturer will give hints for travelling on the road. Dare we suggest that County Councillors in this country would do better in following the Poitiers example than in doing all they can to hinder the progress of the automobile movement in Great Britain?

A REMINISCENCE OF THE FIRST RUN OF THE AUTOMOBILE CLUB.

By Motor-Bicycle to Italy.

THE trip over the Alps on a motor-bicycle made last year by Mr. Joseph Pennell and the subsequent papers on the subject read by this gentleman will be still fresh in the minds of our readers. Mr. Pennell is again seeking adventure, for in a letter to us from Paris he informs us that he intended starting on Sunday last on a journey to Italy. He is using a 1901 Werner motor-bicycle, which he considers an enormous improvement over that of last year, and he is hoping to have a more comfortable trip.

Acknowledgment Wanted.

It is always pleasing for us to see articles and illustrations which appear in our pages reproduced in the columns of our American contemporaries, but it is also more satisfactory, and only what is really due, that proper acknowledgment should be given for the same. While this courtesy is extended by the majority of American motor-journals, *Automobile Topics*, of New York, is a notable exception. We have drawn their attention to the fact that illustrations are frequently reproduced

in their pages without any mention of the *Motor-Car Journal*, but so far without result. In the last issue to hand of our contemporary there appears a long illustrated article on the French motor-car exhibition which is supposed to be from a special correspondent in Paris. On reading through it we find that, with the exception of the opening paragraph, the first five pages are identical with those which appeared in our pages over a month ago. So much for American "special correspondence"!

Doctors and Motor-Cars.

THE great advantage of motor-cars to doctors cannot be overestimated, as, apart from the question of economy, they overcome all possibility of delay in time of emergency. One of the most commendable features of the automobile is its readiness to respond to immediate action. Oftentimes the loss of a few minutes would jeopardise the life of a patient, which by the use of a vehicle ready for immediate starting would save many in the throes of death. It requires from 15min. to 30min. to harness and prepare a horse for a journey, more especially at night; but with ready means at hand to start without delay at high speed the saving of time would be of incalculable benefit to the suffering one. Among metropolitan doctors who have been quick to recognise the advantages of motor-vehicles is Dr. A. H. Cook, of Hampstead, who, about four months ago, purchased a "Locomobile" steam-car. Finding the vehicle sufficient for his medical practice, the doctor, a month or two ago, sold his carriage and two horses. His coachman has turned *mecanicien*, and has studied the machinery sufficiently to enable him to do a good many of the minor repairs. Dr. Cook has used the car twice daily since the middle of November, and has been over 1,000 miles in it, and he reports that, although Hampstead is a hilly district, the car can manage the worst hill with ease.

The Coming Change.

COMMENTING on Mr. Balfour's suggestion in regard to radiating thoroughfares with a surface designed for motor-car propulsion, the *Onlooker* considers this a most provident proposal. Our contemporary adds, "Though we yield to none in our affection for the steed, it cannot be denied that the absence of the horse would make for the greater cleanliness of the streets; and, consequently for the purity of the atmosphere. A London street filled with a swarm of burnished, easily-moving horseless vehicles would in very truth be a pleasanter place in which to live and move and have our being than it is at present."

An Anti-Speed Crusade in America.

AT a mass meeting of taxpayers recently at Mineola, L.I., a strong protest was made against the excessive speeds at which motor-cars are run by well-known automobilists of New York and Brooklyn on the main roads of Long Island, and a Bill was prepared and indorsed giving the county supervisors power to limit the speed of automobiles within their jurisdiction. It was suggested in the Bill that the speed limit be fixed at eight miles an hour and that every automobilist be compelled to stop at a signal from a fractious horse. Leading members of the Automobile Club of America were up in arms when they heard of the proposed action of the Long Island community, and a conference was immediately held between members of the Law Committee, the result of which was the drafting of a Bill, to be presented at Albany and urged by the Club's representatives, as a substitute for the measure of the Long Island mass meeting. The Club wishes to discountenance excessive speed, but objects to promiscuous legislation on the subject such as would follow the enactment of such a law as proposed. The Bill which is being drafted by A.C.A. will, states the *Horseless Age*, provide for a speed limit of fourteen or fifteen miles an hour in country districts and considerably less in thickly settled districts, on the ground that motor vehicles can be stopped much quicker than horse-drawn vehicles. Following the example of the Automobile Club of Great Britain, the Board of Governors of the A.C.A. has passed a resolution to the effect that the abuse

of the highways by drivers of motor-cars should be and is disapproved by them, and that any member of the Club who can be proved to have committed such an offence shall be suspended or dropped from the rolls.

Automobile Club Competition Rules.

A CONFERENCE was held at the Automobile Club on the 6th inst. between the Competitions Committee of the Club and a Committee of the English Motor Club. Mr. R. Todd was in the chair, and there were also present the following members of the Competitions Committee:—Mr. Roger W. Wallace, K.C., Mr. Mark Mayhew, L.C.C., the Hon. C. S. Rolls, Mr. Campbell Muir, Mr. Harry J. Swindley, and Mr. C. Johnson, secretary. The following gentlemen represented the English Motor Club:—Mr. S. F. Edge, Mr. C. Jarrott, Mr. A. J. Wilson, Mr. F. W. Baily, Mr. G. H. Smith, Mr. T. Maltby, and Mr. A. J. Ilsley. Mr. A. J. Wilson first explained the proposals of the Committee of the English Motor Club. Mr. Edge, Mr. G. H. Smith, and others spoke. The Competitions Committee stated that they were prepared to recommend to the Club Committee the following variations in the Competitions Rules, so far as the year 1901 was concerned. (1) The free registration of riders in automobile races or competitions to be continued but to be embodied in the form of entry for events. (2) The rule requiring the registration of motor-vehicles to be suspended during this year, except in competitions held by the Automobile Club, and in any special case in which the Competitions Committee may in granting a permit for a meeting insist upon the registration of vehicles. (3) The employment of official handicappers to be optional during 1901. (4) National Cyclist Union timekeepers to be recognised by the Competitions Committee provided they apply every year for registration by the Automobile Club and are accepted by the Competitions Committee and placed on its register. (5) In cases where clubs holding a cycling or athletic meeting wish to include not more than two automobile events in their programme, the Competitions Committee will grant a permit for a fee of 2s. 6d. Permits for Club Meetings may also be obtained for the same fee of 2s. 6d. The general intention of these variations in the rules is that the Competitions Rules may be as little obstacle as possible in the promotion of competitions. The representatives of the English Motor Club expressed themselves as fully satisfied with the variations above referred to.

Speed and Distance Indicators.

THE plethora of cyclometers, tachometers, etc., pressed on our attention by dealers in cycle accessories finds no parallel as yet in the motor trade, and such apparatus has usually had to be devised by the ingenious automobilist for his own use. A very satisfactory device of the kind recently seen on a Decauville car consisted of an ordinary cyclometer attached to the steering pillar, and actuated by a striker pulled by a Bowden wire fastened at the other end to a lever, touched by a pin on the rear wheel. Another was a "Metroscope" cyclometer, driven by a small pulley on the countershaft instead of the usual friction wheel, while many of the old-fashioned patterns adapted to the large wheels of old-time cycles have had a new lease of life on modern automobiles. These, however, are usually of too short a range to be of much use, and a cyclometer suitable for 30 to 40 in. wheels, and capable of being read from the seat, is much to be desired. A more elaborate apparatus is Mr. Harrington Moore's ingenious "log," and we remember seeing a small mechanism of a similar kind on Sir David Salomons' Peugeot; but some inquiries we made in Paris about a year ago failed to discover any speed indicator suitable for an ordinary car. A gradient meter, of which several types are to be had, affords interesting indications; and it may be worth noting that we have usually found the gradients as given in the "Contour Road Book" about two points less than the actual steepest part of the hill; thus a hill marked 1 in 10 usually proves to have a 1 in 8 slope at its steepest, at any rate in the S.E. and E. counties.

The Coulthard Steam Tip Wagon.

THE above illustration shows the steam-tip wagon which has been delivered to Messrs. John Dugdale and Bros., of Lowerhouse, near Burnley, by Messrs. T. Coulthard and Company, Ltd., of Preston. The vehicle is one of Messrs. Coulthard's standard four or five-ton lorries. The tipping body, which is, of course, additional to the standard specification, is capable of taking a load of four or five tons of slack, and is so fitted that it can be tipped by one man. The leading dimensions are: length over all, 18 ft. 3 in.; width over all, 6 ft. 6 in.; height over chimney, 8 ft. 10 in.; platform, 12 ft. 6 in. by 6 ft. 6 in.; area of carrying platform, 80 sq. ft.; fuel bunker capacity, 4 cwts., equal to a run of 30 miles; speeds (fast and slow), 5 and $2\frac{1}{2}$ miles. The carrying capacity of the vehicle on fair macadam or paved roads, and on grades not exceeding ten per cent., is five tons. On bad roads or grades of more than ten per cent. the load must, of course, be reduced to suit the roads. The limit of grade which the makers guarantee the vehicle to safely ascend is ten per cent. with a five-ton load. The various handles for steering, starting, reversing, and brakes, also the main steam valve and boiler feed handles, are all in direct range with the driver, and the fuel used is either coke or coal. The main frame of the vehicle is of channel steel, braced and constructed so as to carry the whole of the machinery, boiler, and tanks, the frame itself being supported on the axles by long laminated springs. Steam is generated in a boiler of the vertical fire-tube type. It is built for a working pressure of 200 lbs. per square inch, and is inspected by the National Boiler Assurance Company, Messrs. Coulthard issuing a twelve-months' insurance policy in that company with each boiler sent out. In addition to a feed pump connected directly to the engine, an independent steam pump is fitted as an emergency feed. The engine is of twenty-five brake h.p., of the firm's well-known compound type. It is fitted with link reversing gear, and the whole of the motion is carried in an oil-tight case, which is extended so as to envelop all the reduction and compensating gear and shaft. This not only ensures perfect lubrication, but protects the mechanism entirely from dust. The drive is transmitted to the road wheels by means of Renold's Silent driving chains, and the wheels are of gun-carriage pattern, with steel hubs, oak spokes, and ash felloes, the rear tires being 6 in., and those of the steering wheels 5 in. A triangular attachment is fitted to the driving wheels, whereby the drive is taken direct to the wheel

felloes, and not through the spokes. The main control of the machine is by means of two hand brakes fitted to the rear wheels; these brakes are capable of holding the vehicle on any gradient. The makers have endeavoured to produce a vehicle which will work well on a small expenditure for repairs, and with a reasonably long life, and they undertake to renew any part of the vehicle which may fail or break within six months of delivery, provided, of course, that such breakage or failure be not due to neglect or improper usage or accident. Although the wagon has only been in use a short time, Messrs. Dugdale express themselves as well satisfied with its working.

THE French Automobile Club is organising an international electrical accumulator competition to begin on June 1st next.

THE Motor Manufacturing Company, Ltd., last week despatched one of their miniature Panhard voituresses to Lord Cadogan at the Viceregal Lodge, Dublin.

MR. AUSTIN, of the Wolseley Company, has promised to read a paper on the subject of automobiles before the Cycle Engineers' Institute in May. It is proposed to hold this meeting in London at the Agricultural Hall, during the period of the Automobile Club Show.

REFERRING to the 20 h.p. Daimler car, illustrated in our last issue, Mr. Sidney Straker, Assoc. M. Inst. C.E., informs us that the designing and arranging of this vehicle was entirely his work. It is accepted as one of the fastest cars in the country, being capable of travelling upwards of fifty miles per hour.

MR. SEYD, Managing Director of the International Motor-Car Company, Limited, of 106, Great Portland Street, W., informs us that they are exceptionally busy and have a number of orders in hand for their new voituress, the "Charette." The above premises having become too small, they are shortly removing to a much larger depot in High Street, Langham Place, W.

MESSRS. FRANK F. WELLINGTON, Limited, inform us that in consequence of the great demand for the Wellington Sparking Plug the rights for wholesale manufacture have been granted to Messrs. J. Lucas, Limited, of Birmingham, who later on will supply these plugs to wholesale houses. Messrs. Wellington have retained the right to manufacture what they require for their own retail customers.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE BRIGHTON POLICE AND AUTOMOBILISTS.

A GREAT many automobilists have had to complain of the way in which they are persecuted by the Brighton police, but now this body of public servants are resorting to measures which are not only unfair, but do not seem to be straightforward. They have selected a piece of road outside Brighton, at Patcham, and there they pretend to have set up an apparatus by which they can time perfectly the speed of a motor-car. The result of this exploit is that Mr. S. F. Edge was summoned at the Hove Petty Sessions for not stopping when requested by two policemen, and for driving his car at a greater speed than twelve miles an hour; and for this purpose they took out two separate summonses.

The first policeman's evidence was to the effect that he had marked out the beginning and the end of one furlong with pieces of paper held fast against the ravages of the storm by a chunk of stone. He stated that he stood half-way between the two pieces of paper with a stop watch, and that when Mr. Edge got to the first one he started the watch; by that he estimated that Mr. Edge covered the furlong in $20\frac{1}{4}$ seconds. When he found that this was at the rate of twenty-two miles an hour, he signalled to the next man to stop Mr. Edge. The next man was in plain clothes, and declared that he shouted and put up his hand, but that Mr. Edge took no notice. Next came a police constable named Baker, who was in uniform, and he declared that, though he shouted and put up his hand, Mr. Edge took no notice of him also. Having exhausted the evidence, they called in a young man, whom the advocate for the police described in impressive tones as "an independent witness," who swore that Mr. Edge must have seen the two policemen put up their hands and heard them shout, but that he took no notice.

The defence was that at the place in question the car was running badly, and that the pace was very much under twelve miles an hour, and also that Mr. Edge was not driving at all, although he was in the car. The witnesses for the prosecution under cross-examination all distinctly swore that Mr. Edge was driving and that his hands were on the driving wheel, but they admitted under cross-examination that—though they recognised Mr. Edge as the driver, they could not recognise any other gentleman who was in the car; in fact, one policeman was led to ruin his evidence on cross-examination by picking out a gentleman in a row of six, who were asked to stand up in court, as one who sat next to Mr. Edge, and which gentleman was not on the car at all, but was the landlord of an hotel at Clawley. This ought to have been enough for any Bench of magistrates to displace the positive assertion on oath that Mr. Edge was driving; but while the magistrates were willing to make allowance for the constable picking out a man being on the car who was not there at all, they were not prepared to say that he was mistaken as to Mr. Edge being at the wheel.

For the defence, Mr. Edge gave evidence, as also did two gentlemen who were on the car with him. They swore that Mr. Edge did not drive during the journey from Brighton to London, and also gave explicit evidence as to the speed. After the evidence was heard and Mr. Staplee Firth had summed up the case to the Bench for the defence, they retired to consider their decision, and ultimately dismissed both cases against Mr. Edge. Mr. Firth then applied to the Court for costs, and pointed out that it was mere persecution for the police to amuse themselves by laying traps and summoning automobilists, whether there was any real ground for doing so or not, that his client had been put to considerable expense by the unwarrantable action of the police, and that an example ought to be made of such conduct; and, although the magistrates did not agree with these statements, they ordered the police to pay £5 to Mr. Edge for costs.

ARRANGEMENTS have just been concluded between Mr. Hans Renold, of Manchester, and the Ewart Manufacturing Company, of Chicago, whereby the latter will manufacture the Renold "Silent" and other driving chains for the American market.

CORRESPONDENCE.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With all due respect to Mr. R. W. Buttemer, I must disagree with him as to the causes of side-slip on motor-bicycles. The "good old ordinary," true, was practically free from the evil, but was not this owing to the height of driving or pulling wheel, which was also the steering wheel? This was about twice the diameter of the motor-bicycle wheel. By reason of this height a less inclination was required when turning a corner than one requires on the modern safety. Again, the small solid tires took a better grip of the road than pneumatics do.

Having given the point some study, I am sure the proper place for the motor is round about the bracket, driving into bracket if possible, and in centre line of bicycle.

I have designed such a machine, and think it will be a success for the following reason:—The weight of motor low down will tend to counteract weight of rider and make the wheels bite the ground better. If you take a piece of wood about the size of a bicycle, and place a weight on top, it requires only a small tap sideways to knock it from under. If you place the weight further down, say about bracket height, you will find a much harder tap is required to dislodge the wood.

A brilliant future awaits the motor-bicycle, and it is worthy of more attention from designers. I am sure your readers would welcome further "motor-car experiences" from Mr. Buttemer. I hope he has not deserted his car for "the new love."

Yours faithfully,

GEO. GIBSON.

MOTOR-CYCLE MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some of the troubles of many of your correspondents are so similar to some that I have experienced in the past, that a short budget may be of interest, if not of service. I have had in use more or less for nearly a year a Phebus-Aster $2\frac{1}{2}$ h.p. motor quad. With rare exceptions I always drive with a passenger on the front. The machine weighs about $3\frac{1}{2}$ cwt., or with two persons on about 6cwt. I can speak in high terms of the Aster motor and of its carburettor, and I believe if they were more known they would be much more used than they are at present.

I have experienced much trouble in driving up hills. This is, however, not to be wondered at. It is absurd to expect a small-powered motor to drive a highly-g geared machine weighing when loaded some six hundredweight up steep hills. The wonder is rather that the little engine is so powerful as it is. I am glad to say that my troubles as regards hill-climbing appear now to have disappeared. After a good deal of bother and inquiries I lately purchased, from Paris, a "Dupont" two speed gear apparatus, and had it fitted to my motor and machine. I believe the gear is not much known in this country, but I am informed on good authority that it is the best apparatus of the kind on the market. Whether this is so or not I cannot say, but I can say it most efficiently fulfils all the purposes for which it is intended. Its simplicity and moderate cost are also points that will commend it to many. To change from one gear to another is very easy—a slight movement of a small lever—involving no stoppage of the motor or machine. The same remark applies as to bringing into operation the free engine or the free running of the machine, apart from the motor. The roads being very heavy lately with mud I have found the gear of much advantage in all sorts of ways which its use alone can describe. In fact, without such an apparatus it would have been impossible to drive about with the roads in such condition as they have been lately, at least about Reading, as I know from experience during part of last winter and spring.

The conclusion I have come to is that no quad ought to be supplied without a two-speed gear. Personally I would under no circumstances take to a single geared quad again. I desire to recommend those gentlemen who have so freely in the past

advised against the use of two-speed gears, with air-cooled motors, to make themselves more familiar with the matter in a practical way before they venture to advise others against the use of an apparatus which has proved to be of such great advantage.

As regards loss of power or compression, this may be discovered at several points. I have found a leakage at the joint of the gas tube where the gas enters the motor. Of course leakages have been found at the points usually looked for, viz., compression tap, seat of inlet valve, round the joint of the cylinder head, and about the sparking plug. I have had great loss of power caused through the defective fitting of piston rings. In this instance the ends of the rings were too far apart, having been filed too much for the purpose of fitting easily into the cylinder. When loss of power has occurred, I have found the most satisfactory manner to discover leakages was to run the motor on the stand, and then test all likely parts and joints with a lighted taper or match.

A large compression tap, which can be fitted at quite a small cost, is a great improvement on the small tap usually fitted to the motor. With a large tap open there is no trouble in pushing a heavy machine, even up hill, compared to the work involved with a small tap and pushing against nearly half compression. Like many others I have found the best firing results are obtained when the points of the sparking plug are rather less than one-sixteenth of an inch apart.

Some time ago I had a short circuit very difficult to locate. It was caused by a very small defect, at one point, in the vulcanite covering the coil. This point was immediately under one of the metal bands attaching the coil to the machine. The result of course was that the current passed through this defect on to the metal band. I have had one of the Woven-glass accumulators for some time and can speak in high terms of its efficiency. Since its use the numerous sparking troubles I previously had, when using dry cells, have entirely ceased. I may, however, say I found a set of the "Meyra" very good and reasonable in price.

Yours truly,
G.

GEARS AND IGNITION FOR MOTOR-QUADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an amateur I should esteem it a favour if any motorist who has an experience with motor-quads would inform me of the correct number of teeth to have on the sprocket wheel of a (Allard's) 3 h.p. motor, there being 112 on the large gear wheel. The one I have on now has eighteen teeth, which is all right for going on the level, but jibs at all the hills. I shall also be glad to know from users whether Van Raden's Woven-glass accumulators for tricycles and quads are reliable, whether they can be charged at any local charging station, and how many miles are they supposed to carry.—Yours truly,
CHUM.

THE BOLLEE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Mr. Alan A. L. Hickman's letter in your last issue, can that gentleman or any other correspondent inform me who the makers are, and if there is more than one firm manufacturing them. I believe I have seen articles in some journal stating that bad workmanship had caused the owners of certain Bollées much trouble; also that the hind wheel should be fitted with a tire intended for a much heavier machine if it were expected to last. What is the price of the cars, and where could I obtain a detailed description of this machine with illustrations?—Yours truly,

INQUIRER.

ROYALTIES AND PATENT RIGHTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some short time ago an advertisement appeared in your columns stating that we were paying royalties for the use of patent rights covering the various parts of a motor-carriage. We have received, and are receiving, so many inquiries that we would be much obliged if you would give us an opportunity of

explaining the position this company occupies in regard to these patent rights.

Briefly, we hold the right without any payment by way of royalty or otherwise to make practically every known type of motor-carriage and consequently every part used in their construction. The principal types which are covered by these patent rights are Daimler, Panhard, De Dion, Peugeot, Werner. We, however, at present confine ourselves to the manufacture of the Panhard, Daimler, and De Dion types, and we are the sole agents in this country for Werner's motor-bicycle.

An important part of our business consists in the manufacture and sale to the trade of separate motors, and we are entitled to grant to our customers, should they desire it, a special licence authorising them to make any part of a motor-vehicle in which the motor is to be used, and which may be covered by any of the patents in question. In this case only a royalty equal to about 10 per cent. on the price of the motor, not the motor-carriage, would have to be paid. We supply any part of a motor-carriage, not only motors, carburettors, gear wheels, tanks, etc., but we have large wood turning, painting, and upholstering shops, and can supply wheels and carriage bodies of the very best materials and workmanship in quantities. To any part covered by the patents a licence plate is attached by us.—Yours faithfully,

The Motor Manufacturing Company Ltd.,

ALFRED BURGESS, Secretary.

A PUBLIC DENIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing Mr. Osborn's letter in your last week's issue, I enclose you a copy of the letter sent to Mr. S. F. Edge (who is a director of the British Motor Traction Company, Limited) and a copy of his reply. This letter appears to me to be something after the general system that the British Motor Traction Company have of all dealing with all the business they touch—if they do not want to recognise anything, each one tries to shuffle out of his responsibility by saying he does not know anything about it.—Yours faithfully,
C. FRISWELL.

[COPY.]

S. F. Edge, Esq.,

14, Regent Street, S.W.

DEAR EDGE,—At a meeting of the Executive Committee of the Automobile Mutual Protection Association, Limited, held this evening, I was surprised to hear that a report had been spread in automobile circles that I had agreed with your group to practically give away the Association in consideration of certain advantages to be given me. My only object in agreeing to meet you the other day was to hear what you had to say and report to this Association with a view to seeing whether such negotiations might be used to advance the interest for which the Association has been formed. I find, however, that apocryphal accounts of our negotiations have been spread (certainly not by me), which are damaging to me and to the interest of the Association: I beg, therefore, to inform you that I decline to discuss the matter further with you, except through the solicitor of the Automobile Mutual Protection Association, Limited—Mr. Firth.—Yours truly,

February 26th, 1901.

C. FRISWELL.

[COPY.]

C. Friswell, Esq.,

48, Holborn Viaduct, E.C.

DEAR FRISWELL,—I am rather surprised to receive your letter of the 26th; as the only people with whom the matter referred to has been discussed in the slightest degree has been with Mr. J. H. Adams and his chairman, as I could not very well speak to them about a license without telling them that we had discussed the matter together.

In no way would the conversation be interpreted in the way you suggest, and I am sending copy of your letter with copy of my reply to Adams, and I await a reply from him, which will make it very clear that no breach of faith on my side has taken place. However, your answer on the subject is perfectly clear and simple, and your action in fighting the matter for yourself should assuredly meet with much approval at the hands of the firms whose battles you will be fighting.—Yours truly,

February 27th, 1901.

S. F. EDGE.

MR. J. H. DAVIES, of the Crest Manufacturing Company, of Cambridgeport, Mass., U.S.A., writes: "I read with considerable interest your patent troubles. I shall soon put on the market a constant-level carburettor without a float, which is designed so that the present Longuemare can be altered to the new type. As soon as I get my English patent, I will send you an illustration of this device. I think it will be of interest to your readers, as it will remove the present litigation that must be a hamper to the automobile industry."

AUTOMOBILE NOTES FROM BELGIUM.

BY "AUTOMAN."

A MOTOR-CAR made anywhere near Brussels should at any rate have special virtues as a negotiator of hills—Brussels is nothing but "hills and rollers," and some of them mighty stiff ones, with narrow streets, awkward turns, and bad paving. Notwithstanding all these adverse conditions, the motor-car has taken on firmly here and can be seen gliding along all the important thoroughfares in numbers greater even, in comparison to the population, than in Paris itself. The types most in vogue are of Belgian make—Daimlers from the Ateliers Germain of 6, 8, and 12 h.p., some with the old high body, others with the latest low racing body introduced by Panhard and Levassor; little Vivinus cars (known as New Orleans in England), and the familiar light blue Pieper cars from Liège.

The question of the numbering of cars, which is the burning question with you in England, has long since been settled here. Every car is numbered and registered by the police and carries an enamelled iron plate, generally on the front axle. The plate measures about 9 in. by 5 in. with the number in black letters on a white ground. At the back of the car there is a lamp with the number painted on the glass in such a manner that when the lamp is lighted the number can be seen. The numbers are very disfiguring, and give one the impression that the cars are not private carriages, but are for hire. I interviewed the owner of a 12 h.p. Daimler the other day, and he told me that the numbering is very annoying, and gives rise to all kinds of petty interference with the rights of the subject. It removes the possibility of the owner of the car getting any independent

testimony, or even being able to reply guilty or not guilty to a charge made against him. A policeman who has nothing to do, and who feels out of temper with motor-cars in general, only needs to note down the number of a passing car, and the unhappy owner is summoned and fined on his unsupported testimony. It is monstrous to think that it should be proposed in England to interfere in such an arbitrary manner with the liberty of the subject, and it will certainly have a disastrous effect on the development of the industry, already so hampered with patent troubles and speed limitations. It is to be hoped that sound common sense will, on second thoughts, prevent the authorities from making such a retrograde step.

In the middle of next month the annual automobile charity fête will take place under the organisation of the Committee of Tours and Fêtes of the Automobile Club of Belgium, and to encourage the public to bring their cars, one of the big manufacturers has offered a silver chain and pendant to every participant driving a car turned out of their works. The A.C.G.B. and I. might take a hint from Belgium and help to overcome the public prejudice by organising a charity fête—say for the hospitals. There would certainly be a universal response from automobilists.

Petrol cars are being experimented with here for fire-engine purposes. Saint Gilles, one of the suburbs of Brussels, is

running experimentally a petrol car carrying four firemen, ladders, a drum with 150 metres of hose rolled on it, and the apparatus first required at a fire.

An automobile tour round Belgium is being organised; it will last five days and cover 300 kilometres (rather over 197 miles). To those who did the now famous thousand-mile tour in England this seems—and really is—nothing, but the roads in Belgium outside the chief towns are so execrable that speed is out of the question.

The annual International Automobile Exhibition opens at the Pole Nord in Brussels on the 16th inst. The opening ceremony will take place at two o'clock, in the presence of either the King or Prince Albert of Belgium, the heir apparent. Many of the Ministers will also be present, and it promises to be a brilliant affair. The exhibition will remain open until the evening of the 24th inst. A charity fête will be organised before the exhibition closes, and the profits on the sale of the catalogues will also be devoted to charity.

I went out the other day on a 12 h.p. Belgian Daimler, and had a chance of testing its hill-climbing capabilities and also of examining some of the points of difference between it and its twin sisters of Paris and Coventry. The change speed gear is the most salient feature, and is got at in a most satisfactory and

ingenious manner. The toothed wheels are always in gear with each other, the one set being, as usual, keyed to the shaft, and the other set being loose on a sleeve. They are put into gear by means of a slotted bush, into and through the slots of which a hollow shaft passes. On this hollow shaft are four keys solid with the shaft, which engage alternately the slots in the bushes.

The change of speed is smooth and easy, and produces no jerk. The wheel base of the Belgian Daimler is much longer than that of its English or French sister. The car is capable of attaining a speed of about thirty-seven miles per hour, and climbs 8 per cent. hills on the second speed. I hope to send you more details of this car in another letter.

Cliche de

THE TURGAN STEAM CARAVAN IN ALGERIA. (See page 17.)

[Le Chauffeur.]

AN international motor-car exhibition is to be held in Turin, Italy, in the spring of 1902.

WE hear that Messrs. De Dion and Bouton are shortly bringing out a new front-driving motor-bicycle.

M. G. FORESTIER delivered a lecture on the Heavy Automobiles before the Société des Ingenieurs Civils in Paris last week.

AT the last meeting of the Herne District Council, held at Herne Bay, a letter was read from Mr. Collett, of Southall, asking whether the council would license two motor-cars to ply for hire. The matter was deferred for consideration at the next meeting.

THE South Shields Corporation have had on trial a motor-van for the purpose of collecting and removing day refuse. After about ten days' working, a comparison was instituted between the cost of motor and horse vans, and the Borough Surveyor reports an estimated balance in favour of the motor-van, of £49 13s. 11d. per annum.

THE EMPRESS LIGHT CAR.

FIG. 1 of the accompanying illustrations gives a general view of the attractive light car with *tonneau* body which has just been put on the English market by the United Motor Industries, Ltd. The frame of the vehicle is of tubular construction; it carries the whole of the motor and transmission gear, and forms an independent chassis to which any type of carriage body—two-seated, spider, or *tonneau*—can be fitted. The engine, which is located under a bonnet in the forepart of the frame, is a $4\frac{1}{2}$ h.p. water-cooled De Dion, a pump and radiating coil being fitted in connection with the water circulation. A De Dion carburettor is employed, while the electrical ignition device is readily accessible.

Three speeds forward and a reverse motion are provided. The method of transmission and change speed gear is on novel lines, so that a brief description will not be out of place. The rear road-wheels are loose on the axle, and geared directly by spur wheels without the intermediary of chains. The variable gear box (Figs. 2 and 3) is located at the rear, the connection between it and the friction clutch being by a longitudinal shaft. For all the speeds, except the highest, the speed reduction is obtained by means of a reducing gear, but for the highest speed the motor-shaft drives the differen-

provided with clutch claws E. B is an intermediary shaft on which turns loosely a set of gears C' D' G', which cannot be displaced in an axial direction. The pinion G' remains constantly in mesh with gear G on the shaft H. It will easily be seen that by shifting the sleeve F by means of the lever Q, operated from the seat of the vehicle, the pinions C and C' may be thrown in mesh to obtain the slowest speed, and D and D' for the intermediate speed. In these two cases the motion is transmitted to the differential through the intermediary of the pinions G G'.

If the sleeve is pushed still farther, D and D' are disengaged, and the two sets of claws, or clutch teeth E E' engage, in which case the differential is driven directly from the motor shaft, and the pinions C' D' G' now rotate without transmitting any power. In the case of the two lower speeds, there is a quadruple reduction of speed between the motor and the rear road wheels, and in the case of the high speed a triple reduction. This permits of using pinions of small diameter, which are easily enclosed.

The differential shaft

J J' carries at its extremities two spurpinions M M' engaging with internally-toothed gears fixed to the driving wheels. The internally-toothed gears are entirely enclosed, the interior being filled with grease.

Ample brake power is provided, there being a band brake on the differential gear; this is operated by a foot pedal, the depression of which, to the extent of half of its movement, throwing out the clutch, the further depression putting on the brake. There are also emergency hand brakes acting on the cases surrounding the internally-toothed gear wheels; these are operated

FIG. 1.—GENERAL VIEW OF EMPRESS LIGHT CAR.

FIG. 2.—PLAN OF VARIABLE SPEED GEAR AND REAR AXLE AND WHEELS.

tial directly. The motor-shaft A passes through a sleeve F, which can be displaced in an axial direction by means of a lever. It is prevented from rotating by two feather keys in the bearing of the casing. When being displaced in an axial direction, this sleeve carries along the shaft A, which has keyed to it the two-spur gears C and D, and is

FIG. 3.—SIDE ELEVATION OF VARIABLE-SPEED GEAR.

by a hand lever. On applying either brakes, the friction clutch is first thrown out and the motor thus disconnected from the transmission. Steering is controlled by a horizontal hand-wheel, around the standard of which are grouped the various control levers so that the driver has everything convenient to his hand. The water tank is located in front of the dash board, while the petrol tank is placed under the front seat. A feature of the *tonneau* are the high backs given to the seats, rendering it very comfortable; the rear portion can be detached by removing four bolts, converting the car into a two-seated car with plenty of luggage room. The car we examined the other day was finished in dark and electric blue with yellow and black

lines and has a very attractive appearance. The body is very "roomy," and is spring suspended on the frame. Special attention has been paid to the upholstering, the seats, which are provided with springs, being covered in real leather. Cycle type wheels are fitted, and these can be shod with Dunlop, Clipper, or Michelin pneumatic tires as desired. The car, on which we hope shortly to have a trial run, weighs, complete, about 7 cwt.

SCOTTISH NOTES.

The Lord Justice-Clerk and the Society of Arts.

THE principal event of the week in the Scotch motor world was the lecture delivered by the Lord Justice Clerk of Scotland, the Right Hon. Sir J. H. A. Macdonald, in Edinburgh, on Monday night, to the members of the Royal Scottish Society of Arts. There was a large attendance, prominent among them being several members of the Scottish Automobile Club. The Lord Justice Clerk's subject, "The Present and the Future of Motor Traction," was responsible for this, and those who were present had placed before them in a clear and incisive manner a most interesting account of things automobile in general. After referring to the big start which France had obtained over us in this direction, the lecturer urged that if the present state of things was to be remedied it would not be by seeking to copy the productions of France, Germany, and America, but by producing vehicles which in style, build, machinery, and details should commend themselves to the British market. His lordship speedily dismissed the objections raised by ignorant people to motor-cars, emphasising among other things the ease with which they could be controlled and steered. The objection as to expense was only true in a sense, for in buying a power-vehicle the carriage and horse were purchased in one, and when not in use there was no horse eating its head off in the stable. As regarded the smaller size of vehicle it was quite certain the introduction of power traction would open up a way to persons of moderate means to provide themselves with an efficient road vehicle who could never afford a horse and carriage. While they could mend a broken cog-wheel or repair an exhaust chamber in a motor-car, they could not change a horse's leg or renew the inside of a "roarer." Speaking of the future of the power vehicle, on its bearing upon the social, sporting, commercial, military, and sanitary phases of life, his lordship said it might be regarded as a quite safe prediction that the next quarter of a century would see an extraordinary revival of roads as a means of communication, as distinguished from their merely local usefulness.

Utilitarian Possibilities of the Motor.

A STRONG point was made by the Lord Justice Clerk in his lecture, on Monday, in regard to the generally utilitarian possibility of the motor, and which should go a long way in helping some hesitating mortals to make up their minds to purchase a car. It would probably be found in the course of time, he said, that the possession of a motor might be of much greater usefulness in the country than was represented by its locomotive powers merely. It might be utilised to work a force-pump, run a dynamo, charge storage batteries for electric light, and, like the villa gardener, "make itself generally useful." As his lordship held, there is no reason why the motive power should be used for locomotion only, and once this aspect of the case is brought before the "canny Scot" (and Saxon, too, for that matter), who likes to get full value for his money, we may obtain a large increase in the ranks of owners.

The Effect of Weather.

THE weather in Scotland during the past week has turned a little more salubrious, and with drier roads, less piercing winds, and an occasional glimpse of sunshine, after one of the most miserable winters experienced for some years, the motor-car is once more in evidence on our highways. Having occasion to be on business in Hamilton this week, while passing

down the main street of that town, I noticed Mr. Roland T. Outhwaite, of Edinburgh, bowling merrily along on a powerful-looking Daimler, artistically painted in dark green, the business-like throb of whose engine appeared to indicate that the car in question was fit for a good hundred-mile spin; I did not know Mr. Outhwaite's destination, but as far as mortal eye could tell and the appearance of his car went he certainly looked as though he would "get there." The past few days have brought out a good many motor-cars which I have only seen on rare occasions during the past winter. I do not take this to mean that Scotch automobilists are afraid of winter driving. I do not think it is true, but many of them are also owners of comfortable closed carriages which most people agree are to be preferred when a winter is made up of an almost unbroken succession of rainy days.

An Ideal Touring Place.

SCOTLAND in many respects is an ideal place for motoring, while the roads in many places are what might be called "decidedly tough." With a good car this is a small matter, and the beauty of the country which may be traversed more than compensates for a few stiff grinds up hill. I drove up to the fine Hydropathic at Shandon, on the Gareloch, last week in a growler, and was pleased to see a horseless chariot standing at the entrance on my arrival. I do not know who the *chauffeur* was, but his appearance excited a good deal of interest among the residents at this popular establishment; and when he drove away with a load of fair passengers, doubtless for a spin round the beautiful loch, many an envious glance followed the car. This is a route I should strongly recommend to intending tourists, as the drive from Glasgow through Dumbarton and Helensburgh on to Shandon and round the loch, is a most picturesque one, and can be indefinitely prolonged through an altogether charming country.

The "Johnstone" Car.

THE "Johnstone" motor-car, the product of the Mo-Car Syndicate, is almost daily conspicuous on the streets of Glasgow. As far as I can gather there are very few of these cars about, but the one in question looks a remarkably serviceable vehicle. It runs with great quietness, and is built on somewhat different lines to the average car, a seat, on a chariot-shaped front, taking the place of the usual motor-hood. The makers experienced the usual difficulty in getting a thoroughly satisfactory working model for a pattern, but now they have got something apparently serviceable they should soon be in a position to cope with the demand, which is daily increasing for a good car.

Wanted, More Enterprise!

It appears that English motor manufacturers awoke only a few weeks ago to the fact that the Glasgow International Exhibition, which has been in the course of preparation for the best part of three years, and will be opened in about six weeks' time, was to be a really important function, and one in which it would be advantageous for them to take part. At the eleventh hour an effort was made by the Secretary of the Automobile Club to get room for motor makers from the South, but the cost of erecting a special pavilion on the only remaining site was evidently too great for the limited number of makers and agents and the scheme therefore fell through. The responsibility of representing the British automobile industry at the great Exposition, therefore, falls upon a Scotch house whose name is sufficiently well known, viz., Stirling's Motor-Carriages, Limited, of Hamilton and Glasgow, who, I am informed, are the only British motor-carriage manufacturers who have secured space in the great Industrial Hall at Kelvingrove. I do not doubt that their display will be such as to suitably uphold the credit of British manufacturers. At the same time, in view of the fact that French automobile manufacturers will be represented in the special pavilion erected by the French Government, it is regrettable that a larger number of British makers are not included. I am not at liberty at present to send particulars of the special features of Messrs.

Stirling's exhibits at the Exhibition, but from what I have learned this week some new things will be shown for the first time which are certain to create a good deal of stir. BROWN HEATHER.

THE ROUBEAU CARBURETTOR.

A NEW carburettor for use on motor-cycles and voiturettes, which appears to possess certain features of merit, has lately been put on the market by La Société du Carburateur Roubeau, of Paris. A general view and section of the device are given in Figs. 1 and 2, and attention may be drawn to its small dimensions, its adaptability to any existing motor, while it is also capable of a very fine adjustment. To obtain the best result from an explosive mixture of gas and air two

FIGS. 1 AND 2.

conditions are necessary: (1) A perfect mixture of gas and air. (2) A mixture of the proper proportions. In the case of petrol motors,

FIG. 3.—VIEW OF CARBURETTOR AS FITTED TO A TRICYCLE.

the best result is, states the designer, obtained with a mixture of 1 volume of gas with 8.340 volumes of air, or, in other words, 1

cubic centimetre of petrol with 8.340 litres of air. Any variation adversely affects the power explosion. If the proportion of petrol rises to 1 cubic centimetre for 4.5 litres of air, the mixture becomes non-explosive. On the other hand, if the volume of air is increased to 15 litres to 1 cubic centimetre of petrol, the same thing happens. The necessity of a correct mixture can thus be seen, and it is claimed that this precision of adjustment is obtained in the device under notice. M. Roubeau has utilised to the best advantage the powerful suction exerted by the petrol motor on the charging stroke, introducing simultaneously on a very small injector air and petrol in pre-determined quantities and subjecting them to complete pulverisation. The petrol flows from the tank through the pipe A into the chamber B, the upper part of which is pierced by small holes. A valve C closes the inlet pipe; it is held in place by a spring, the rod of which terminates in an inverted cone which deflects the air as it is drawn into the carburettor. Regulation of the flow of petrol is obtained by a tap, which is provided with suitable fixing arrangements, on the lower part of the pipe D. The base of the carburettor proper is pierced by six holes 7mm. in diameter, below which works a rotating piece H. The latter is provided with a similar number of holes, so that the air inlet openings can be varied or entirely closed. The top cone screws on to the bottom, and its interior is cut with a large number of circular grooves, for the more effective gasifying of the petrol. Just above the grooved part is a loose collar with eight holes 3in. in diameter, adjustable by hand. If air is allowed to enter here, suction through the lower holes is reduced, and as a consequence less petrol is drawn in. The weight of the apparatus is only about 13ozs. The company are anxious to arrange for the introduction of their device on the English market.

COUNTY COUNCILS AND MOTOR-CARS.

EAST SUFFOLK.

At a meeting of the East Suffolk County Council on Tuesday, in the clause of their report which related to motor-cars, the Committee recommended that all such cars should carry a number both in front and behind, and should be registered. Mr. C. A. Day proposed, as an amendment of the report, that this clause should be struck out.—Colonel Ward seconded.—Alderman R. L. Everett said he hoped the Council would not agree to this amendment. At the present moment many horses were very much frightened at motor cars, and, if there were no means of checking those who drive such vehicles at too fast a pace, the consequences might be very serious.—Alderman the Rev. C. J. Steward said that if this condition as to carrying a number were omitted, he hoped the Council would also omit the clause which practically removed all restrictions on pace. If there were to be no numbers on the cars, he would certainly restrict their pace to five miles an hour.—Mr. Gostling asked whether it was not the fact that in France the authorities had found that there were fewer accidents to motor-cars than to horse carriages.—Mr. W. Short thought the Council should be very careful before putting any restrictions upon new facilities of transit.—Alderman the Rev. J. F. A. Hervey considered that the carrying of numbers ought to be insisted upon as a fair return for the concession made by the Committee with regard to pace.—Colonel Buxton said the objection to carrying a number was a purely sentimental one, and Mr. George Fiske strongly supported the recommendation of the Committee.—The amendment was rejected, seven members voting for it as compared with thirty against, and the rule as to numbering and registering cars was consequently approved.

AN exhibition of motor-vehicles and accessories is to be held, under the auspices of the Reading Automobile Club, on Tuesday, Wednesday, and Thursday, the 26th, 27th, and 28th instant, in the Reading Corn Exchange, Market Place, Reading. We learn that all the available space has been taken, many of the best known motor manufacturing firms having arranged to exhibit. For the benefit of intending purchasers the committee is arranging for trial runs upon the day following the show.

THE FRENCH MOTOR-CAR EXHIBITION.

(From Our Own Correspondent.)

(Concluded from page 13.)

M. HIDIEN, of Châtillon-sur-Indre, exhibited a two-seated car, fitted with a two-cylinder horizontal motor running at 800 revolutions and developing 8 h.p. The power is transmitted to the rear road wheels by spur wheels and chains, the whole of the gear running in an oil bath. Three speeds, ranging up to 50 kilomètres an hour, as also a reverse motion, are provided. Wooden wheels and pneumatic tires are fitted, with the usual wheel steering. M. Hidien is, I understand, building an 18 h.p. racing car.

La Société des Automobiles et Moteurs Français, Courbevoie, Seine, exhibited a light carriage, which they claim can be placed in the hands of a lady or any inexperienced person. The motor is of the two-cylinder horizontal type, developing 6 to 7 h.p. at 800 revolutions per minute. The spirit is sprayed into the cylinder and fired electrically, but the company are at present not prepared to supply any details of their system. Power is transmitted by a belt from the motorshaft to the countershaft at the rear. The latter carries the differential and the change-speed gear, which gives three speeds and reverse. The weight of the car for four persons is about 11 cwt. The tanks have a capacity of twenty litres of petrol and thirty-five litres of water. The levers are conveniently arranged, the one operating the change-speed

FIG. 1.—THE "SALVATOR" MOTOR-BICYCLE.

gear being behind the inclined steering wheel, while a side lever operates two hand brakes on the rear axle.

Two types of light cars were shown by Messrs. P. Morisse and Company, of Etampes (Seine et Oise), one with a horizontal motor and the other with a vertical engine, the latter running at 1,100 revolutions per minute and developing $5\frac{1}{2}$ h.p. The change-speed gear is arranged for two speeds, the third speed, or rather the first, being obtained by direct connection between the universal jointed shaft and the engine shaft.

M. E. Goujon, Neuilly sur Seine, had on view a four-seated *vis-à-vis*. Power is supplied by a low speed single-cylinder horizontal motor located at the rear, and developing $5\frac{1}{2}$ h.p. The engine is water-cooled, a pump and radiator being provided. The motor-shaft is geared directly on to the change-speed gear, and the second intermediate shaft is connected by a chain with a countershaft carrying the differential, and there is a further chain drive to the rear road wheels. Four speeds forward and reverse are provided, while the cycle type wheels are shod with pneumatic tires.

The Amiot and Peneau fore-carriage or *avant-train* system, about which so much was heard a few years ago, turned up again on the stand of M. L. Comber, of Asnières (Seine). In this case the *avant-train* is an electrical one, which can be fixed under the front part of any existing horse-drawn vehicle. This case carries a battery of B.G.S. accumulators, which are said to be able to

allow of the vehicle running from eighty to a hundred kilomètres on one charge. The motor is geared down on to a shaft above the front axle, with which it is connected by chains.

A car which comprises several interesting features was that shown by Messrs. Gillet, Forest and Co., of Saint Cloud. As I hope to send you a full description of this for a later issue, I will only mention that they claim that their motor is the most economical on the market. Power is supplied by a single-cylinder horizontal motor, the normal speed of the 5 h.p. engine being not more than 800 revolutions a minute. The rate of running is varied in the usual way by advancing and retarding the ignition, and in this way the speed can be regulated from 100 to 1,200 revolutions. The change-speed gear consists of the usual fixed and sliding trains of wheels. From the gear box the power is transmitted by a shaft to the differential on the rear axle. All the parts are enclosed in aluminium cases with oil baths. The underframe of the car is of tubular construction, and is mounted on wooden wheels. Special advantages are claimed by the firm for their radiating coil, which is composed of vertical corrugated copper tubes placed around the front part of the motor bonnet.

Considerable attention was centred on the stand of La Société des Automobiles Vallée, of Le Mans (Sarthe), who exhibited a frame carrying the propelling mechanism all complete, arranged to be drawn in and out from the channel section steel underframe of the car, so as to facilitate cleaning and repairs, and also to allow of the mechanism being used for several carriages if desired. The engine is of the four-cylinder horizontal type, developing 10 h.p. No change-speed gear is provided, power being transmitted by two belts running on flanged steel pulleys at each end of the motorshaft. Heavy jockey pulleys are provided to tighten the belts, the pulleys being raised or lowered by a pedal. One of the claims for this arrangement is that it greatly simplifies the driving gear, as the speed is varied entirely by the engine regulator.

Messrs. Caron and Co., Rue Saint Ferdinand, Paris, exhibited a four-seated *vis-à-vis*, in which the motor bonnet, of a peculiar shape, is entirely separated from the carriage body. The vehicle is propelled by a water-cooled Ardent motor developing 8 h.p. The change-speed wheels are always in mesh, and are connected as desired by a couple of clutches. From the gear box the power is transmitted by a shaft and bevel gearing to the differential on the rear axle. The firm also exhibited several air-cooled motors, which are claimed to develop $3\frac{1}{2}$ i.h.p. when running at 1,500 revolutions per minute.

Something entirely new in motor-bicycle construction was shown by the Ateliers de Construction Mécaniques Ducommun, of Mulhouse, Alsace, in which the makers have endeavoured to combine the advantages of the motor in front with rear driving. In the "Autobicyclette," as the new machine is called, the motor is fixed to the head tube, so that it does not move with the steering handles, and power is transmitted from the motor shaft by a long belt to the rear driving wheel in the usual way. The rider's leg is protected from the belt by a guard made of metallic gauze. The motor develops $1\frac{1}{2}$ h.p. at 1,500 revolutions per minute. Its power is varied by means of a lever which acts on the exhaust valve. The machine is fitted with a two-speed gear which is operated by a lever on the top tube. The petrol tank is suspended from the horizontal tube, and has a capacity sufficient to allow of the machine running a hundred miles.

La Compagnie Française des Moteurs et Automobiles "Salvator" of Rue Amelot, Paris, exhibited a new motor-bicycle (Fig. 1), in which the motor is built as part of the machine, instead of being fixed to any kind of frame. The engine is fixed on a bed connected between the bottom bracket and the end of the down tube, and is held vertically by means of bolts, so that it can be easily removed if necessary. It develops $1\frac{1}{2}$ h.p., and the transmission is by means of a belt from the motorshaft to a pulley on the rear driving wheel. The motor is cast with cooling ribs having a very large surface, and the exhaust valve is in front, so as to have full advantage of the air. A feature of the bicycle is a new method of magneto-electric ignition, the device used being said to weigh less than a pound. The petrol and induction coil are carried in the tank supported from the top bar of the frame.

Most of the motor-bicycles in the show were, with one

or two exceptions, fitted with motors with a maximum of 1½ h.p. One of the exceptions was the Cyclette Jochum, manufactured by M. Gabriel Jochum, of Nancy. The motor is the old pattern 1½ h.p. De Dion, which has been fixed on the bottom bracket by an attachment to the diagonal tube. Its novelty lies in the fact that it has been entirely enclosed in an aluminum case, which is intended to facilitate cooling of the motor by creating a strong draught of air that will enter the case at the bottom, and, after circulating around the ribs, will issue from the case at the top. For this reason a special form of fly wheel has been fitted, which draws in the air through the case. The machine is fitted with a free wheel and change-speed gear operated by a lever on the top tube. Another feature of the bicycle is the carburettor, which, it is said, will allow of the motor running equally well with alcohol or petrol. The maker claims that this machine will go up any hill without the aid of the pedals. It may be added that the weight of the machine is 99 lbs.

THE BOLIDE ELECTRICAL IGNITION.

WE are now able to give illustrations of the ingenious devices in connection with the electrical ignition of the new Bolide cars of Messrs. Leon Lefebvre and Co., of Paris, to which reference was made in a recent issue. From Fig. 1 it will be seen that the ordinary flat spring trembler has been dispensed with, its place being taken by a spiral spring arrangement somewhat similar to that now in use by the Decauville Company. Fig. 2 illustrates the small apparatus employed for verifying the state of the electric ignition. The method usually adopted is to try the sparking plug in open air by with-

FIG. 1.

FIG. 2.

drawing the induction valve. But this system is entirely wrong, for the conditions are totally different. When in work there is a very considerable pressure existing in the cylinder, which, with the removal of a valve, entirely disappears. Without pressure the spark will often appear quite effective, but subject to some eight or ten pounds of pressure it cannot be produced. The "Bolide" apparatus permits of the testing of the sparking plug under conditions approaching those existent during its actual work, and by means of a small glass one can see whether or not the spark is produced as it should be. The arrangement is small and light, and can be used in connection with any sparking plug and any make of tire pump, for an air pump has naturally to be used to create the necessary pressure.

DE DION-BOUTON, Ltd., is the new title adopted by the De Dion Bouton British and Colonial Syndicate, Limited.

THE Schwanemeyer Motor Manufacturing Company, Limited, has been registered with a capital of £7, to carry on the business of cycle and motor-car manufacturers and merchants, engineers, etc.

A DECISION of importance to French automobilists was delivered in the Paris courts recently, when President Baudouin declared illegal the interdiction placed by the proprietors of a handsome property in the fashionable Monceau quarter, on the entry of an automobile into the courtyard of the building. After the question had been argued by counsel for both parties, the judge declared that automobiles had the same right of access to courtyards as other vehicles.

HERE AND THERE.

WE understand that the Easter tour of the Automobile Club will be to Salisbury.

WE hear that it is probable a motor service will shortly be started at Weymouth.

MESSRS. S. BROWN AND CO., New Street, Brompton Road, S.W., inform us that they have accommodation to store cars of any country motorists visiting London.

MAJOR H. C. L. HOLDEN delivered a lecture on Automobiles and their Use for Military Purposes before the members of the Royal Artillery Institution on Thursday last.

MESSRS. ORMISTON AND GLASS, the well-known pen manufacturers, have for some time past had two motor vans in use. They have now ordered a third one from the Motor Manufacturing Company.

THE employees of the Daimler Motor Company held a smoking concert on Friday last in Coventry Cross for the purpose of presenting Mr. W. Patterson, their late works foreman, with an illuminated address.

IN a circular to the shareholders, Mr. A. Burgess, the secretary to the Motor Manufacturing Company, Ltd., states, "that the sales made and orders taken from the beginning of November to the end of February were exceedingly good, i.e., £32,000."

MESSRS. HEWETSONS, Ltd., the British agents for the Benz cars, are moving into larger premises. They have purchased the lease of a commodious shop and warehouse in the Tottenham Court Road, which is being equipped with tools for the purposes of repairs, a lift from basement to the fourth floor, etc.

MOTORISTS passing through Ashford will be glad to know that petrol supplies can be obtained from Messrs. Brenchley and Davis, 1, Norwood Street. They are also well equipped to carry out any necessary repairs.

THE police authorities at Nice are looking for a *mecanicien* named Champion, who was employed by an attaché to the Russian Embassy in Paris. Champion took out his employer's car for a little jaunt with his friends and smashed it badly. He then left it at a *garage* for repairs and disappeared.

THE Council of the C.T.C. have petitioned the President of the Local Government Board in opposition to the suggested restrictive measures affecting automobilists. The President of the L.G.B. has caused an acknowledgment of the receipt of it to be sent to the C.T.C. with the promise that it shall be duly considered.

MR. NEVILLE GRENVILLE has been busy educating the members of the Somerset County Council with a steam carriage he built in 1875, and later with a motor-tricycle and trailer. The consequence was that at the last meeting, when the proposed restrictions came before them, the Council resolved to have nothing to do with them.

IT is announced that a novel system of pacing is about to be introduced at the Friedenau cycle track in Berlin. A number of electric motor tandems are to be acquired, but, instead of the electrical current being furnished by accumulators carried on the machines, an overhead wire, the same as used in connection with electric tramways, is to be erected around the track, the machines taking the current from this by a trolley.

THE following is a list of firms who have signed the memorial of manufacturers to county councillors in addition to those already published:—Aberdare Valley Motor Service Company, Limited; Brooke and Co., Limited, Lowestoft; E. H. Clift, Kensington; Dougill and Co., Limited, Leeds; George Dower, Wick, N.B.; Durham, Churchill and Co., Sheffield; Ideal Storage Battery Company, Church Passage, London, W.C.; Morris Bros., Pontypridd; H. J. Mulliner, London, W.; New Century Motor Syndicate, Limited, London, E.C.; Oxford Motor-car Company, Oxford; Steam Vehicle Company of America, London, E.C.; Shippey Bros., Limited, London, E.C.

A MOTOR FIELD BATTERY.*

By MAJOR H. A. BETHELL, R.F.A.

WE sometimes hear it suggested that in a few years' time our horses will be done away with, and our guns pulled by motor-cars. Such statements are not usually taken seriously. Yet more unlikely things have come to pass. People who deride the idea have possibly never even seen a modern steam car. It requires only a short acquaintance with steam motor-cars to dispel one's vague notions of the absurdity of a steam engine careering across country, and to make the most hardened conservative admit that there may be something in the idea. But whether it is practically possible or desirable, in the present stage of development of the motor-car, to replace our horses by motors is quite another question. It may help to answer it if we set forth the principal facts about steam-motors as now made, the objections to the steam car, and the advantages to be gained by its use.

Steam cars are made by six or seven principal firms in this country. They are largely used as heavy lorries and brewers' drays, and to a less extent as pleasure carriages. There are few places in England inaccessible by road, so that the demand has hitherto been principally for road cars. But orders are now coming in from abroad for cars capable of getting across country, and a type of car is being developed to meet the demand. The steam motor has no connection with the old road engine, with its cylinder and crank shaft on top and its huge fly wheel. Imagine instead a steel box about the size of a uniform case. Inside this a small high-speed engine is running at perhaps 600 revolutions per minute. It runs in an oil bath, so that it requires no oiling, and it has no loose or adjustable parts. Silent-running toothed wheels reduce the speed to convenient limits and convey the motion to the driving wheels. The boiler consists of a nest of small tubes surrounded by flames. The water is forced through these tubes either by a pump or automatically by the action of the steam. There is very little water in the boiler, and as fast as the steam is used water is pumped in to replace it. Steam can be raised in one of these boilers, starting with everything cold, in about half an hour from the time of lighting the fire. But for the chimney, the whole engine and boiler as turned out by some makers might be stowed away under the driving seat of a brougham. The chimney is certainly a nuisance. Its top is usually about 8 feet above the ground, and the height cannot well be reduced, as a good draught is necessary to make the fuel burn without smoke. It is quite possible to do away with the chimney and obtain the necessary draught by means of a fan, but this would spoil the simplicity which constitutes the chief advantage of the steam motor over the oil car. It will be noted that these objections to the steam car as a pleasure vehicle are not of great importance from the military point of view. Neither a steam car nor a gun limber can be considered a perfect pleasure vehicle. The military objections to the motor are more serious, and will be considered later on.

The carriage to which the motor proper is applied varies in build according to requirements. For military purposes, and generally for travelling over rough ground, the carriage would either have three wheels or a so-called three-point suspension. This means that the framework rests on the hind axle at both ends, but only on the centre of the fore axle, which turns upon a fore-and-aft horizontal pivot, so that the fore axle is capable of oscillating vertically through a considerable angle. This enables the wheels to adjust themselves to irregularities of the surface. I am not aware, however, that this system has yet been tried over really bad ground. The three-wheeled type would appear better adapted to going across country, but is open to two objections. One is that owing to side-slip it steers badly on muddy roads; the other is that on uneven ground the whole weight is liable to come upon the single wheel and bury it in the ground, unless the wheel is made abnormally broad in the tire. Moreover, as a three-wheeled vehicle has to make three tracks in the dirt as against two for the four-wheeler, the former runs heavier and requires more power to attain the same speed. None of these objections can be considered conclusive, and it can only be determined by experiment whether the three-wheeled type is better than the four-wheeled type, and how far either of them is applicable to military purposes.

In addition to the ordinary gearing for running on the road, a military car would be fitted with powerful slow-speed gearing for use in bad ground, and a winding drum with 100 yards (25lb.) of wire rope for warping itself out of difficulties. For artillery purposes, a motor would be constructed to carry 100 rounds of ammunition and six men, and the gun would be limbered up to it in the ordinary way. Presumably the gun would be a heavy high-velocity 15-pr. quick-firer with axle-tree shields, similar to the guns now being issued, but more powerful. Wagon bodies similar to the present ones, but carrying 100 rounds instead of 64, would be drawn by motors exactly similar to the gun motors and interchangeable with them. This would give 300 rounds of ammunition per gun in the first line, and detachments of 12 men per gun besides the drivers. Five other cars, similar in construction but different in fittings, would carry the five officers, with the range-takers and battery staff. These cars would be capable of pulling guns if required. A battery travelling kitchen, officers' mess car, and an advance and rear guard of cyclist scouts would complete the turn-out.

Now if the motor-car will do what its advocates claim for it, a battery equipped as above would have many advantages over a horsed battery. It would have more powerful guns, twice as much ammunition,

and would carry its own baggage; it would, in fact, be complete in itself. Such a battery could march 12 miles an hour, or 100 miles a day. It could move nearly as fast as a horsed battery over ordinary European fighting ground, i.e., cultivated fields; it could move at 3 miles an hour over ordinary rough ground; and only really bad ground, such as a field battery traverses at a walk with detachments dismounted, would be impassable to it. It would require a less number of men than a horsed battery, and cost considerably less; it would also occupy less space on the road when marching.

OBJECTIONS TO THE MOTOR.

Such being the advantages claimed for the motor, let us consider the objections.

Want of Mobility.—In the first place, it is doubtful what a motor of the proposed "flexible" design would be able to accomplish off the road. We know that a motor is all right on the turf, and we may fairly expect that over heavy but not broken ground, such as standing crops or a ploughed field, the motor will be able to get along by using its low gear, giving treble power* and one-third speed. But we do not know whether uneven ground will stop the motor; if it does, this will be a serious objection, as much good ground will be closed to the motor by the necessity of having to pass an occasional difficult bit. It is hoped that this point will shortly be cleared up.

Several cars for the foreign market, specially designed to move across country, are now being built, and we may hope to learn a good deal from the manufacturers' trials. It would be more satisfactory if the War Office would order an official trial, say in the Long Valley at Aldershot, to determine the capabilities of steam motors. Several leading firms—among others Messrs. Thornycroft, of Chiswick, and Messrs. Simpson and Bodman, of Manchester—are anxious to build vehicles to Government specifications, specially designed for military purposes.

It is to be hoped that the example of the French and Austrian Governments, who have carried out extensive and successful experiments this year, will induce our Government to make a move in the matter. Taking the most unfavourable view, and supposing that the motor is practically restricted to roads and cultivated ground, a very good case may be made out for its use for home defence. There are very few places in England (or indeed in Western Europe) which are not within a hundred yards of a road or track of some sort, and those places are not likely to be the scene of real warfare. No general would be likely to select Dartmoor or Salisbury Plain as a theatre of war. Warlike operations in Europe will be confined, as in the past, to populous districts affording food for men and horses and roads for the transport of supplies; and in such districts rough uncultivated land is rarely to be met with.

Liability to Break Down.—The next objection to be considered is the liability of the motor-car to break down. We are accustomed to regard the ordinary petroleum car as a most unreliable vehicle, constantly getting out of order, jibbing at starting, and otherwise misbehaving. This, however, does not apply to steam cars. Purchasers of steam wagons are not apt to let them stand idle, and they are usually worked quite as hard as a military motor would be worked in war time. Under these conditions experience shows that the steam motor is comparatively free from break-downs, and that casualties, when they occur, are almost invariably due to mistakes made by the drivers.

Liability to Sink in Soft Ground.—Another objection is, that the great weight of the motor would cause it to sink in soft ground. Now a motor to carry 100 rounds of 15-pounder ammunition, and six men with their kits (say 3,000lbs.) and to pull a gun in addition, would weigh about 3 tons. The weight of the driver, fuel, water and accessories, would bring the weight up to about 5 tons in all. This is two and a half times as heavy as the present ammunition wagon. Therefore, if the wheels, being of the same diameter, are made two and a half times as wide in the tire (say 8-in. driving wheels and 4-in. leading wheels), the motor will be no more liable to sink than our present field artillery carriages.

Vulnerability in Action.—If one horse of a team is struck, the gun can go on with the remainder; but if the motor is disabled the gun must stop. Now the boiler and machinery of a motor-car, taken sideways, offers just about the same target as a horse, or some 2 square yards. Therefore the motor-car is three times less likely to be struck than a team of three pair of horses. Seen end on, the car offers about 1½ square yards of target as against, say, 3 yards for the team, and is, therefore, half as likely to be struck. Set off this against the fact that three horses of a team may be killed without permanently stopping the gun, there is not much to choose in point of vulnerability. Moreover the boiler and machinery of the car are only penetrable at short range by rifle bullets, and as a rule the car if struck is easier to repair than a horse.

I attach an extract from a specification submitted by Messrs. Simpson and Bodman of Manchester:—"The vehicle is so designed that the penetration of a bullet will in very few cases affect the working of the car. The boiler tubes being so constructed that it is almost if not quite impossible to penetrate them, and in the event of this being done, it is only a matter of a few minutes to blank a tube off (as every joint is outside the boiler, there is no necessity for cooling down). In the event of one side engine being disabled the other side engine is of sufficient size to run the vehicle with scarcely any loss in speed."

While on this point it may be noted that the number of motors of similar power proposed for the equipment of a battery gives considerable flexibility. Thus in case of a breakdown each of the five officers' cars could pull a gun, and by reducing the road speed to eight miles an hour

* From the Proceedings of the Royal Artillery Institution.

* Or six-fold power for a short distance, by admitting steam direct to the low pressure cylinder.

each of the wagons could limber up a gun behind it, leaving the six gun-motors spare.

Danger from Fire.—It may be objected that it is dangerous to carry ammunition on the same carriage as a furnace, especially when the latter is liable to emit sparks from the chimney. The answer is, that in the first place there is no danger from the direct heat of the furnace, as the water tank may be placed between it and the ammunition. As to the sparks, cordite or ballistite cartridges carried in closed brass cases, as in the new equipment, may be considered fairly safe from accidental ignition.

Delay in getting up Steam.—Starting with everything cold, it takes from twenty to thirty minutes, according to the pattern of boiler, to light the fire and get up working pressure of steam. Two thirds of this time is taken in getting the fire to burn, and by adopting extreme measures—such as firing up with a truss of straw and a tin of gun-grease—steam might be raised in ten minutes. On service there would be no difficulty in banking the fire so as to keep the boiler hot and raise steam in a few minutes. Comparing this with the time taken to harness up and hook in a battery, we may estimate the difference at only from five to ten minutes in favour of the horses.

Visible Smoke.—This would be a serious matter on service. When using wood or miscellaneous fuel it would be impossible to prevent the position of the motor from being disclosed by clouds of smoke. To obviate this it would be necessary to carry a store of coke or charcoal, to be replenished whenever possible, for use in the presence of the enemy.

Comparative Expense.—The following table shows the comparative cost of the motor-car and of a team of six horses. The cost of a complete battery equipped with 18 motors (including officers' cars and spare motor) would compare in the same proportion with a battery horsed with 108

Tactics of a Motor Battery.—The special qualities of the motor-car would entail some minor modifications in the tactics of a battery. In the first place, owing to the high road-speed of the motor and the reduced space occupied, the wagons would always be able to accompany the guns. The effect of this would be, that a gun would always have its full detachment of twelve gunners close at hand. This enables a gun to be unlimbered under cover, and run up by hand to the top of a ridge, without exposing the motors to view or to fire. When retiring guns from action it would often be possible to halt the motor under cover behind the battery, run out the wire rope, and haul the gun back to the motor, instead of bringing the latter on to the crest to limber up. Each car, though only provided with seats for six gunners, would carry eight more standing without risk of breaking down; this provides the means of carrying into action an infantry escort of 96 men, besides the 40 that could be carried on the officers' cars.

As the motors could only conveniently carry a supply of fuel for 40 miles and water for 20 miles, a portion of the advance guard would be constantly occupied in commandeering baskets of coal and buckets of water from the houses along the line of march, ready to hand up to the motors to enable them to replenish bunkers and tanks without stopping.

Distribution of a Motor Battery.—Taking the battery in column of route on the road, the distribution would be as follows:—

1. Advance guard of twelve cyclist scouts, relieved every hour.
2. Battery commander's car, carrying the major, sergt.-major, range-takers, pay-sergeant and cash-box, and the major's servant.
3. No. 1 gun motor, carrying sergeant and five gunners.
4. No. 1 wagon motor, carrying corporal and five gunners.
- 5-6. No. 2 gun and No. 2 wagon.
7. Leading section commander's car, carrying subaltern, sergt.-

A LOCOMOBILE IN THE SNOW.

horses. But there would be a considerable additional saving in peace time on the motor battery, as probably only 12 out of the 18 motors would be in use.

COST OF A TEAM OF SIX HORSES FOR SIX YEARS.

The annual cost of a driver is	£51
The annual cost of a horse, including stabling, saddlery, shoeing, and veterinary attendance, is £44 19s. 7d., say	45
[The average of our Home Establishment provides 0.75 driver per horse, therefore a 6-horse team has 4½ drivers.]	
6 horses 6 years at £45	£1,620
4½ drivers 6 years at £51	1,377
Total	£2,997

COST OF A MOTOR-CAR FOR SIX YEARS.

Cost of car	£600
1 driver 6 years at £80	480
½ spare driver at £70	210
Fuel and oil for 12 hours a week under steam	205
Renewal of boiler tubes and refit after 3 years	50
Annual refit and painting, 5 years at £30	150
Barrack accommodation 6 years at £10	60
Total	£1,755

This estimate is on the supposition that the car is under steam about twelve hours a week. The driver's pay is reckoned at 2s. 6d. a day and his clothing at £7 a year, with the rank of artificer-corporal. From the above figures it will be seen that by using the motor-car a saving of £1,242, or £207 per annum, is effected.

major's clerk, battery office box, second-class artificer, subaltern's servant, and spare driver.

8-17. Centre and rear sections, similar to leading section, except that one subaltern's car carries the tailor instead of the sergt.-major's clerk, and the other the shoemaker.

18. Captain's car, with captain, Q.M. sergeant, Q.M. sergeant's clerk, chief artificer, wheeler, and captain's servant.

19. Officers' mess car and mess sergeant.

20. Men's travelling kitchen and three section cooks.

21. Spare gun-motor, with assistant wheeler, storeman and Q.M. sergeant's stores.

22. Rear guard of six cyclist scouts, relieved every hour.

Road space occupied at 4 yards interval, excluding advance and rear-guards, 221 yards. This is a good deal less than is occupied by a horsed battery, which with its five spare carriages takes 335 yards, besides the space occupied by spare horses.

(To be continued.)

"By Automobile to Paris" is the title of an interesting article in the current number of the *Argosy*.

RETURNS just issued shew that during last year motor-cars valued at £20,360 were imported into France as compared with £18,906 in 1899. The importance of the French automobile industry is well shewn by the fact that last year cars valued at no less than £376,400 were exported from the country, this total contrasting with £170,374 in 1899, and only £69,974 in 1898.

PUBLIC MOTOR-CAR SERVICE IN SOUTH-WEST LONDON.

THE South-Western Motor-car Co., Ltd., has been formed to run a service of light motor-cars between Streatham, Upper Tooting, and Clapham Junction, via Tooting Bec, Trinity, and Windmill Roads. The communication between these important districts has hitherto been of the worst description, and it has been arranged that the cars will complete the entire distance in twenty-five minutes, a little less than half the time taken by ordinary buses. The fares will be at popular prices, and the directors feel certain that as soon as this method of rapid transit becomes more widely known, the system will be assured of popularity.

The inauguration run took place on Wednesday last, and a large crowd assembled at Balham to see the start. There were lined up outside the Company's depot in Balham High-road, seven vehicles, six of them high-class and serviceable wagonettes manufactured by the Motor Manufacturing Company. Mr. Burgess, on a M.M.C. Panhard, led the procession, and a cold but pleasant run to Staines was enjoyed. At the lunch Mr. Hooper, chairman of the company, presided, and was supported by a large and distinguished company.

The Chairman (Mr. A. Hooper) read a letter of apology from Mr. A. J. Balfour, who was obliged by the invitation, but regretted that his Parliamentary duties prevented him from attending. Mr. Councillor Hunt also wrote to the effect that if they could prove that it was unnecessary to cut up our roads, and put down tram lines at a cost of £3,000 per mile, they would have done good service. Continuing, the Chairman said that the credit for establishing the service belonged to Mr. French, whose practical knowledge they counted on for the success of the new venture. Their Secretary, who was the largest shareholder in the company, was an American, who would bring the push and energy of his countrymen to the service of the company.

Mr. W. F. French said that this was the pioneer venture of its kind for London, but one which, he believed, would be a thorough success. The public were only too ready to support them, a fact of which he had had ample proof in the last few days. The company could carry them as cheaply as any present system, and in less than half the time usually occupied by a bus or tram. The experience he had gained up to the present showed that most of the companies running in provincial towns had been organised by professional gentlemen who were in the hands of their employees, and there had been failures where there should have been successes. He was going to run this company on commercial lines. He had had considerable experience in locomotive work, and it was his intention to run the service on similar lines. There would be a certain number of breakdowns, no doubt, but the proverbial stitch in time would save many of these. They would endeavour to run to schedule time as soon as they got their full complement of cars. They proposed to run four cars and keep one as a reserve; perhaps they would have to keep two. In locomotive shops they always reckoned to have the same number of engines standing as were running, and though the company could not afford to do that, they would, he hoped, be able to keep schedule time. It was the intention of the company also to job cars for business services, as they felt sure that their value for advertising purposes, as well as for quick despatch, would ensure a large demand. He had had several inquiries already for cars for jobbing purposes, and there was no doubt that motor-cars would eventually become very popular. They also intended to run cars for private purposes, as they could give customers a run of twenty-five miles into the most beautiful parts of Surrey on a Wednesday or Saturday afternoon, and bring them back again, at a charge of 3s. 6d. to 4s. a head, and with great profit to the concern. If they could run these cars faster than the bus, they would command all the patronage they could take, and if they found that the fares they were now prepared to accept did not pay, they would raise them, and so command the cream of the traffic even then. He believed they were fully justified in their new undertaking.

The Rev. Mr. Anderson, an alderman of the Wandsworth Borough Council, said that he most cordially agreed with the point made by Mr. Hunt in his letter to the chairman of the company. One of the greatest difficulties that they as Borough Councils had to deal with was the constant way in which their roads were invaded by all sorts of companies—gas, water, and telephone—who had monopolies and rights of way over those roads. Their progress was constantly blocked, and it was further impeded when they had a system of tramlines laid down. If the company could in any way prevent this terrible invasion, and give them speedy means of communication from point to point, they would do an amount of good work which, he was sure, would not only command the support of such public bodies as he represented, but that also of the public at large. He would venture to predict that it would not be long before the new undertaking was a great success; in fact, he regarded their departure that morning as one of the best that had been made in the neighbourhood for many a long day. The speaker quoted instances of foolish opposition to railways that had been displayed in the Tooting district, and added that they would now welcome anything that would tend to promote better transit. The nimble vehicles they had come along in that day were far more suited to the requirements of the public than the ponderous tram-cars.

Dr. Lucas said that the journey down had certainly opened his eyes as to what would be the locomotion of the future.

Mr. Alfred Burgess said that they had heard something about the failures that had been made with motor-buses in the past. In nine cases out of ten those failures had been due to the inexperience of the people

who had undertaken the work. While they could point to failures, however, they could also point to successes, as at Bournemouth, where twenty more cars were to be introduced to extend the business. If public service cars were only kept clean they would give no trouble whatever.

Mr. C. Cordingley said that Mr. French had anticipated Mr. Balfour's proposals as to the solution of the difficult problem of moving the population from London to great distances.

Mr. H. J. Swindley hoped that the Councillors present would remember, when some motion was brought before them as to speed restrictions, that no harm had resulted from the speed at which the cars had travelled that day.

The Chairman thanked the visitors, and the gathering broke up.

HE'S STILL A MOTORIST!

They said you wouldn't balk or plunge or rear;
Yet home I'll have to walk and leave you here.
As gentle as a lamb, they said you'd be;
As vicious as a ram you've been to me.
They said you wouldn't shy or run away;
Yet here lie you and I, both wrecks to-day.
They said you'd never try to "take a fence";
You took it on the fly and moved it hence.
The horse's fastest gait was slow for you;
You had the ass' trait of meekness, too;
You were with ease controlled, or so they said;
Yet here but now I rolled out on my head.
Oh, once more let me feel that I'm astride
The good old horse or wheel I used to ride.
They never left me sore as here I'm seen,
Preserved, with bumps galore, in gasoline.

—Chicago Post.

FURIOUS DRIVING CASE.

AT the Hove Petty Sessions on Monday, Mr. J. H. Gladding, of Clapham, London, was summoned for that, being the driver of a light locomotive on the London Road, Patcham, he did drive at a greater speed than twelve miles an hour on February 16th. Mr. Staplee Firth defended. Defendant did not appear, but a letter was read from him explaining that he was unable to attend. P.C. Leverett stated that the measured furlong was covered in 29½ seconds, which was equal to a rate of 15 miles 2 furlongs an hour. Corroborative evidence was given by P.S. Dalmon and P.C. Baker. Mrs. Pawley, a lady who was travelling with the defendant, said she did not think they were going at more than ten miles an hour. They were "crawling along," as she was nervous. Mr. Firth disputed the accuracy as to the time in which the furlong was covered, urging that a mistake might have been made, but the magistrates convicted, imposing a fine of 5s. and costs.

NOT A LOVER OF MOTOR-CARS.

BEFORE the Brighton Borough Bench on Monday, Astley Metnerell, on bail, was charged with being drunk while in charge of a horse and cart in Ship-street.—P.C. George Tucker said on Saturday evening about 7.45 he saw prisoner driving a horse-drawn vehicle in New-roid. He turned into North-street, and as he did so witness noticed that he was swaying about on the seat. Seeing that he was drunk witness took him into custody. Basil Eyles, an electrical engineer, in the employ of the Corporation, said about 6.30 on Saturday evening he was riding a motor-quadracycle in New-road, when prisoner, who was driving in a reckless way, cut across him very sharp, and afterwards tried to pass him on the wrong side of the road. Had not witness pulled up very sharply there would have been a collision. Prisoner afterwards followed him round Grand-parade, up North-street, and into Bond-street, and witness lodged a complaint as to his reckless driving. Prisoner said he was more obstinate than drunk, and was very sorry for what had occurred. He was not a lover of motor-cars, and supposed that the sight of one spoilt his temper.—Fined 10s. and costs, or 14 days.

USING A MOTOR-CAR WITHOUT A LICENCE.

AN adjourned Justice of the Peace Court was held in the Sheriff Court, Dundee, on Wednesday, last week, for the purpose of considering a complaint at the instance of the Excise authorities against Mr. Alexander Ross French, dentist, who it was alleged was using a motor-car without having a licence. It will be remembered that the case was adjourned some time ago pending the decision of the Sheriff regarding the ownership of the car now in dispute. Mr. James Magowan, supervisor, Brechin, stated that the case was still in exactly the same position as at the previous J.P. Court. The supervisor having, in response to the Bench, stated that he had no objection to adjournment, the case was fixed for the first Wednesday in December.

MR. MARK MAYHEW, L.C.C., passed through Paris on Saturday last with his 16 h.p. Napier car. He was en route for Nice, where he takes part in the tourists' race on the 25th inst., as a kind of preparation for the Gordon-Bennett Cup race.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, MARCH 23, 1901.

[No. 107.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AS briefly mentioned in our last issue, Major H. C. L. Holden, Superintendent of the Royal Gun Factory, Woolwich, gave a lecture to the members at the Royal Artillery Institution at Woolwich on Thursday last week, on "The Automobile and its Possible Uses in Warfare." He described various types of steam and petrol motor-cars, referring to electric vehicles as outside the range of practicability. The work done by steam tractors at the French manoeuvres was illustrated by lantern slides, and the speed and other qualities of petrol cars were also enumerated. He believed that the automobile would yet become an important factor in tactics, and the transport of infantry at a very high rate of speed was even now practicable. The cars could be protected from rifle fire by plates of nickel steel, and could carry defensive weapons, such as Maxims, which would render them formidable adversaries if attacked. Among less obvious applications for the automobile was the carrying of search lights, which had hitherto had to be dragged into position by horses. For the crossing of rivers quicker means of hauling boats could also be arranged by means of automobiles. The Röntgen rays apparatus could be easily worked, and for wireless telegraphy automobiles could be fitted up with the necessary appliances. The Hon. J. Scott Montagu, M.P., Colonel Crompton, Major-General Sir F. Maurice, and others also spoke, and the officers present were afterwards taken for rides on several cars provided by members of the Automobile Club.

The Gordon-Bennett Cup Race.

THE forthcoming International Cup Race is beginning to form the topic of conversation in motoring circles both at home and on the Continent. As is already known, the race is fixed for May 29th, the start probably taking place at Ville d'Avray at 3.30 in the morning. The five German vehicles entered for the race comprise a 32-h.p. Benz, a 70-h.p. Cannello-Durkopp, and three 35-h.p. Daimlers (Mercedes), one of these being probably driven by Herr Tischbein, director of the Cannstatt Daimler Company, another by M. Albert Lemaitre, and the third by M. Loraine Barrow. The eliminating race, under the management of the Rhenish Automobile Club, will take place on May 12th, on the Mannheim-Pforzheim road, over a distance of about 168 kiloms.

County Councils and Motor-Cars.

INCLUDED in the proceedings of the Highways Committee presented to the meeting of the West Riding County Council last week was the following recommendation:—"That this County Council are of opinion that all motor-cars should, for the purposes of identification while travelling, be numbered or otherwise marked and registered, and that the drivers should be under obligation to stop when signalled to do so." Alderman

Sheepshanks objected to putting a light motor-car in the same category as a traction-engine. There was a distinct difference between them. He did not think that any vexatious restrictions should be put upon motor-cars, which had come to stay. They might almost be put in the same category as electric tram-cars. Horses, it was true, might be, and were, extremely frightened at first; but horses had got to get accustomed to these things. He moved that the paragraph containing the recommendation stop short of the final suggestion. Mr. Morris seconded. Eventually the matter was referred back to the Highways Committee, with the object of having the matter further considered and the recommendation differently worded.

The Irish Automobile Club.

THE Irish Automobile Club held their annual general meeting in Dublin last week. The chair was taken by Mr. W. G. D. Goff, J.P. The club officials and executive committee for the ensuing twelve months were elected as follows:—Chairman, Mr. W. G. D. Goff, J.P.; hon. secretary, Mr. R. J. Mecredy; hon. treasurer, Mr. C. W. Grimshaw. Committee: Lord Louth, the Hon. Leopold Canning, Colonel J. Magrath, Mr. E. O'Connor, Mr. C. C. Yeldham, Captain H. R. Langrishe, Mr. J. H. Glenn, Mr. W. Bexton, Dr. Pryce Peacock, Dr. J. F. Colohan, and Mr. A. J. Orr. It was announced that the A.C.G.B.I. had decided to hold a fortnight's tour round Ireland in August next, terminating in Dublin immediately before the Horse Show. The management of all details was left in the hands of the committee. Messrs. Goff and Mecredy were elected as representatives of the Club on the council of the Automobile Club of Great Britain and Ireland and also on the executive council of the Motor Union. It was decided to take steps to form an Irish Motor Union, the matter being left in the hands of the committee. The rules of the Club, as revised by the committee, were approved.

The Italian Auto- mobile Tour.

WE have received a copy of the programme of the Automobile Tour of Italy, which is being organised by *Il Corriere della Sera*. The start will take place on the 27th April, from Turin, and Genoa, Spezia, Florence, Siena, Civita Vecchia, Rome, Terni, Perugia, Rimini, Bologna, Padua, Brescia, and Milan will be visited, the tour extending over 15 days. On May 12th the competing vehicles will be placed on exhibition in Milan. The distance is 1,642 kilometres, or about 1,020 miles; the daily runs range from 69 kilometres to 208 kilometres.

Postal Motor-Cars in Paris.

WE announced a few weeks ago that an electrical delivery van was being experimentally tried in connection with the postal service in France. An official trial was organised last week by M. Dubois, director of the vehicle service of the French Post Office, for the benefit of M. Mougeot, Under-Secretary for Posts and Telegraphs. The electric van was filled with letters and despatches and sent from the General Post Office,

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

Digitized by Google

Rue Jean Jacques Rousseau, to the Rue Erard, in the far east of the city. The vehicle carried nearly 16cwt. of letters, or 6cwt. more than the average horse drawn cart. The start from the Central was at 3.29 in the afternoon, and the car was at the Rue Erard, 12th Arrondissement, at 3.44, beating the horse-drawn cart by eight minutes. At a dinner, which followed the trial, M. Dubois announced that he had five more vans on order—three electric, one petrol, and one steam—which augurs favourably for the prompt collection and distribution of letters in Paris in the near future.

Motor-Cars in Madagascar.

AT the invitation of the Governor-General, the British Consul took part in the formal opening of the road between Antananarivo and the village of Mahatsara, which took place recently, making the journey by motor-car from Antananarivo to Mahatsara (245 kilometres) in 28½ hours, 14 of which were employed in the actual travelling. Prior to the completion of this road the same journey, made in a palanquin, usually occupied five days. The completion of this road will, it is considered, entirely revolutionise the existing method of inland transport in Madagascar. Numbers of motor-cars are being ordered to take the place of the native porters hitherto employed in carrying goods and passengers between the coast and the capital.

He hopes that some members of the Automobile Club will write short papers on the subject to be read at the meetings of his section.

Lincolnshire Automobile Club.

THE Lincolnshire Automobile Club had a great success in its inaugural banquet, under the presidency of the Mayor of Lincoln (Mr. C. W. Pennell), at the Saracen's Head Hotel, Lincoln, on Saturday. The visitors were met per motor at Newark and at Sleaford. Among the guests present were Messrs. Roger Wallace, K.C., E. Shrapnell Smith, S. F. and C. Edge, C. Jarrott, J. W. Stock, J. Thropp, A. R. Atkey, G. H. Kirk, W. D. and E. W. Wells, A. H. Niblett, H. Belcher, M. Ross Browne, R. Harbridge, J. G. Hamerton, of the Nottingham A.C., Capt. J. A. Cole, Alderman A. L. Jessopp, Councillors J. D. Goy, W. S. White, and J. H. Foster, G. J. Wilkinson (secretary), R. B. Wrenford (treasurer), Alderman J. G. Williams, Parsons Wright, Dr. W. G. Gilpin, W. B. Jevons, G. Godson, Dr. J. H. Pim, A. A. Padley, F. Allbones, J. R. Richardson, W. R. Pennell, C. H. Gilbert, C. Nelson (hon. secretary), C. Hannan, C. H. Hole, A. J. Percival, W. S. Foster, C. J. Parker, J.P., F. Jecock, R. M. Wright, and other well-known automobilists, over one hundred being present. "After the toast of 'The King,' Mr. Roger Wallace, K.C., gave 'The Lincolnshire Automobile Club.'" He said he was pleased to see

The Manchester Automobile Club.

AT a meeting of the Manchester Automobile Club, last week, the hon. secretary announced the receipt of a letter from the secretary of the A.C.G.B.I. to the effect that as the Manchester Automobile Club was affiliated with the A.C.G.B.I., by virtue of an arrangement recently entered into, its members had become members of the Motor Union, which had lately been formed. A report on the question of the desirability of increasing the maximum weight of light locomotives beyond that authorised by the Locomotives on Highways Act, 1896, to be submitted to the President of the Local Government Board for their consideration, was laid before the meeting, and after deliberation the Manchester Automobile Club decided to support it.

Automobilism and the British Association.

COLONEL CROMPTON has been elected president of Section G, which is the Mechanical Engineering Section of the British Association, a meeting of which is to take place in Glasgow early in September. He has taken for the subject of his presidential address, "The Development of Automobilism."

such branches springing up and doing so much good as the Lincolnshire Club had done. It was the only way a new pleasure, a new sport, and a new industry like this could be fostered and made free of undue restrictions. He thought the membership need not be confined to one social class, but be equally open to dukes or mechanics. There was much to learn and to assist in, and much experience to gain. He was sure they in London would give any assistance in the way of lectures or asking others to come down and address them. Until the law was altered, he counselled them to observe it with caution, and should they be going faster than they were aware (laughter), never to go to the danger of the passers-by. If they were sportsmanlike they would get all they wanted. In responding, the Mayor of Lincoln, Mr. C. W. Pennell, chairman of the Club, referred to his spill while reading the Proclamation. The horses drawing the vehicle on which he was standing refusing to stand still, the suggestion had been made in the papers by their secretary that next time he should use his car. He believed the motor-car had come to stay, at least a "horsey" man told him so when he was three-quarters of an hour starting. There was plenty of prejudice to overcome, but in time they would do it, but must, for the time being, be courteous to all. He was pleased to see that the Club was in a healthy state, there being over

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

fifty members, including some very influential people. They were arranging demonstrations before the Holland and Lindsey County Councils, and hoped to do much useful work. Mr. W. T. Page, jun., proposed "Automobilism" and referred to the over-cautious way of the legislature by which industries were stifled. He, however, believed England was rapidly making up the few years it had been handicapped. Mr. E. Shrapnell Smith responded and congratulated the Club on its successful start. He remembered the handsome treatment of them on the 1,000-Miles Tour last year by Lincolnshire automobilists. He thought the Lincoln machinery works should take up heavy motor vehicles, for which there was such great scope in the county, it being possible to take five tons a dozen miles for 12s. 6d., thus enabling the producer to get his produce to the market quickly and cheaply, and he hoped the farmers would soon be able to produce alcohol for use in internal combustion engines, and so derive a profit out of the movement. He assured them that motors would be very beneficial to the farming industry and would break down isolation. Mr. S. F. Edge also responded for the toast, and gave a very interesting account of his run up, mentioning that he had found it more pleasurable to drive a small car than a large one. He would, however, bring his 70-h.p. car down, and allow some of them to know what it was like to go at sixty miles an hour on some quiet road. Mr. Jarrott also responded, and referred to the pre-red-flag days, when they took out enough spare parts to make a car.

Other Toasts.

ALDERMAN J. G. WILLIAMS proposed "The Visitors," and Mr. A. R. Atkey responded. He said he was sure the members of his Club would be pleased to visit Lincoln again. Lincoln always had been a popular place with Nottingham people, and he hoped the Lincolnshire Club would visit them. Mr. J. W. Stocks, after referring to the time when he was heavily fined seven times in the county in connection with road-record breaking, extended an invitation to meet his Club, the Midland A.C. Mr. Councillor W. S. White and Mr. W. B. Jevons, the two vice-chairmen, responded for "The Chair and Vice-Chairs." Songs were contributed between the toasts by Mr. C. Woodward, of the Cathedral Choir, Mr. P. Andrews, and Mr. Parsons Wright, a member of the club.

The Tire Question.

It is a melancholy reflection that despite the able and successful efforts of English motor builders, their ambitions for the Gordon-Bennett Cup may be thwarted by the tire question. One prospective competitor has suggested that the rules should be relaxed so far as these essential components are concerned; but any such concession to insular incapacity can hardly be seriously wished for. It is no new thing for a discovery of home origin to be appropriated by foreign manufacturers by right of their superior energy and ability, as witness the aniline dye trade; but for such a distinctly British invention as the pneumatic tire, fostered, moreover, under the aegis of a wealthy group of monopolists, to fail to make even a show of competing with its foreign developments, is a more than usually lamentable sight.

The Tare Limit of Heavy Motor Wagons.

THE Council of the Liverpool Self-Propelled Traffic Association have printed their report upon the tare limit of motor vehicles for goods traffic, which is now being circulated as a petition to the Local Government Board for signatures. The Association admit that, as a tentative measure, the act of 1896 remains satisfactory in most particulars, but for heavy traffic purposes—for loads of four tons and upwards of merchandise carried in the vehicle itself—it has been found to impose too severe a restriction as regards the tare weight. They therefore suggest that

the President of the L.G.B. should introduce a new Bill—"To allow light locomotives, which shall otherwise conform with the requirements of the Locomotives on Highways Act, 1896, to be constructed and used under the provisions of that Act, provided the weight per inch width of tire on any wheel shall not under any conditions of running exceed twelve cwt., the legal minimum, viz., four inches, remaining as at present. This weight is already exceeded both in motor and horse-drawn traffic. It is pointed out that such a regulation as that suggested in the proposed clause of a new Act would protect the roads against undue total weights. The present limit affects the tare, and, therefore, appears defective in the direction named, for the spirit of the Act undoubtedly is to protect the roads from damage.

A CHANGE IN LOCOMOTION. MRS. S. F. EDGE IN MOROCCO.

Demonstrations at Worcester.

ON Saturday last a demonstration of motor-vehicles was given at Worcester by members of the A.C.G.B.I. and the Midland Automobile Club before members of the Worcester and Staffordshire County Council. Among the vehicles present were Mr. Alfred Bird's 12 h.p. Panhard, driven by the owner; Mr. J. A. Holder's new 16 h.p. Napier, driven by the owner; a Lanchester car driven by Mr. Frank Lanchester; a 6 h.p. Daimler, lent by Mr. Alfred Harmsworth, and driven from London by the Club Secretary; a Motor Manufacturing Company's 6 h.p. car, and a 6 h.p. Daimler car. Dr. Fernald rode his motor tricycle from Cheltenham, and, later, Mr. Tangye and Mr. A. Tangye each drove a Peugeot voiturette from Birmingham. Among the County Councillors who took drives were Mr. Woodward, the vice chairman of the Worcester County Council, Mr. T. R. Bayliss, of Birmingham, Mr. Owen Gibbons, Mr. F. H. Lloyd, Mr. Pelham Lane, Mr. George Hill, Mr. William Somers, Mr. John Amphlett, Sir Harry Vernon, Mr. Bowen, General Davies, and the Rev. J. B. Wilson; Mr. Seacombe (the acting clerk to the Worcester County Council), Mr. Barker, Mr. Carmichael, and the County Surveyor of Worcester also took drives. The members of the Club and members of the Council were afterwards entertained at luncheon at the Shire Hall by Mr. Willis Bund, the chairman of the Worcester County Council, who was absent owing to the funeral of his son. Mr. Alfred Bird, on behalf of the Club, expressed thanks for the entertainment. On Sunday night, Mr. Thomas H. Parker arrived at Worcester with Mr. Young (of the Wolverhampton Club) on the latter's De Dion voiturette, which Mr. Young placed at the

disposal of the Automobile Club for a further demonstration which took place on Monday last.

The King of the Belgians' New 20 h.p. Panhard.

MESSRS. CHARRON, GIRARDOT, AND VOIGT, have just delivered to the King of the Belgians, at Nice, what is claimed to be one of the most improved, comfortable, and stylish motor-cars in existence. The car is of the same type of Panhard and Levassor racer as those driven by MM. Charron and Girardot, who arrived first and second in last year's International Cup contest. Although of nominally 20 h.p., this can, if necessary, be increased to 30 h.p. The body, by Rothschild et Fils, is of hammered aluminium painted red, the lower part (the chassis) being royal blue. The wheels, too, are blue, picked out with red. The wings over the front wheels are semi-circular, and twisted in such a manner as to act as wind-cutters, while those over the back are flat, and are arranged to carry light luggage. All the visible woodwork is of highly-polished mahogany, and the fittings are of brass throughout. The seats are of an altogether new design, resembling comfortable office chairs, and are covered with red morocco cow hide, His Majesty's *fauteuil* on the left being much more spacious than that of the driver beside him.

Cost of Repairs.

MR. H. EDMUNDS, Chairman of the Touring Committee of the Automobile Club, bought a car at the Paris Exhibition last year. On it arriving at his residence something was found wrong with the differential gear case. He sent it to a local engineer who advertised as a bicycle maker and repairer, also as a manufacturer of scientific instruments. While the car was in his shop Mr. Edmunds made several slight alterations by way of improvements, such as altering the cooling arrangement and other minor details. The work to the differential gear case was unsatisfactory, and the engineer failed to turn the car out so that it would run. He was not, however, deficient in making out his invoice, for he made a charge close upon £90. The work actually done was examined by experts, who valued it upon a liberal valuation at £37 12s. This amount was paid into court. The engineer was dissatisfied and proceeded with an action in the Queen's Bench, which, upon application, was referred to be tried by Mr. Referee Pollock. The case occupied two whole days, and the engineer called about twelve witnesses in support of his case. In the result a judgment has been given to the effect that the amount paid by Mr. Edmunds is ample, and the court has ordered the engineer to pay the whole of the costs of the action. Mr. Staplee Firth had the conduct of the action for Mr. Edmunds.

The Brake Question.

WITH reference to the comments in our last issue on the subject of brakes, the Right Hon. Sir J. H. A. Macdonald writes that he is quite in accord with our views that the "devil" or "sprag" is most objectionable, and sometimes inefficient. In his letter he calls attention to the device used on the Delahaye car. This consists of a disc with ratchet teeth at the hub of the wheel. A cord is kept suspended above it by a cord with a ring, the ring lying in a hook close to the driver's hand. By unhooking the ring a pawl falls on the ratchet, and whenever the motion of the wheel is reversed the pawl falls into the teeth and the wheels cease to revolve. It thus takes effect the moment the wheel moves an inch backward. So far as our experience goes even the Delahaye device does not meet all requirements, for, to act, the cord must be dropped instantly there is any tendency for the car to run back on a hill. If the car is allowed to gain the least momentum, the general experience is that the pawl fails to catch the ratchet. Evidence is not wanting that a good many active minds are at work on the question of devising a reliable device to prevent

motor-cars running back on steep grades, and we have no doubt that ere long these efforts will be crowned with success.

The Gipsy Up to Date.

THE example of Messrs. Turgan, Crawhez, etc., has not been followed here, so far as we know, though in this land of dear and often third-rate hotel accommodation it would appeal to those of vagrant and open-air proclivities. We recollect hearing, though, of an automobilist discovered encamped on Southsea Common inside a small car which he had fitted as a *dormeuse*; but, whether on account of the weight limit or not, the motor caravan has not yet appeared. It would not appear to be difficult with the aid of aluminium, Willesden paper, etc., to build a caravan body with accommodation for a couple of bunks and other necessary appliances, on, say, a six or eight-horse frame, somewhere near the 1½-ton limit. High speed would not be necessary, and in fact, with the limit fixed, would probably be impossible; but we commend the idea to those who seek relaxation in a leisurely manner.

The Brighton Police and Motorists.

IN our correspondence columns this week, Dr. Mühlkamp, of Brighton, gives particulars of his summons for driving a light motor-car at a greater speed than was reasonable and proper, having regard to the traffic on the highway. One inspector stated that at 4.50 on the day complained of the defendant was driving a motor-car at the rate *he thought* of fourteen miles an hour. He and another policeman stopped the defendant. The policeman corroborated as to the probable rate at which the defendant was travelling, and he volunteered his opinion that the pace was too fast. Then came another champion of police, who stated the speed at which the car was travelling to be at from fifteen to eighteen miles an hour. There was no evidence at all to support a conviction in a Court of Summary Jurisdiction, and it is astonishing that any magistrate should convict upon what is obviously guess-work and in the absence of positive evidence.

Education on Legal Points Needed.

THERE are many well-known cases laid down by the High Courts in which it has been distinctly held that it is incompetent for witnesses to give evidence of mere guesswork or calculation, unless it is admittedly expert evidence such as a scientist's. The next great difficulty in the case was, that defendant was driving at too great a speed having regard to the traffic on the highway. It has been held in the High Court that where there are qualifying words of this kind there must be a *bona fide* complaint representing such qualifying words, and in order to justify a conviction legally and properly in this case there should have been evidence by some person or persons representing the traffic on the highway that they were incommoded, inconvenienced, or interrupted in their free passage in some manner or other. The evidence absolutely failed, and can only be described as an ignorant administration of law and turning the machinery into an engine of persecution, the fine of £5 being a vindictive penalty. The same learned representative of the law had before him a day or two previously a case in which a drunken man had driven his horses to the danger of the public, and had wilfully annoyed a motor-cyclist, his only defence being that he hated motor-cars, and that his temper was more to blame than drink. He seemed to appreciate this man's efforts, and only fined him the paltry sum of 10s. These cases, we think, prove the need of a Criminal Court of Appeal, for it seems a monstrous thing that the property of the public should be at the mercy of the animus of such incompetent judgments.

MR. C. G. HAMBLETON, of Cheadle, Staffordshire, has now a stock of petrol, and, having a well-equipped workshop, is able to undertake all kinds of repairs.

THE AUTOMOBILE CLUB EASTER TOUR.

IN order to avoid the inconvenience and worry of changing quarters daily the Automobile Club have decided to make Salisbury the headquarters for Good Friday, Saturday, and Easter Sunday. Salisbury being within a day's drive of London, members who cannot go throughout the tour can join the tour party without difficulty. Salisbury is an excellent centre for touring to Stonehenge, through the New Forest, etc.

ITINERARY.

THURSDAY, April 4th. (Half-day.)

LONDON TO WINCHESTER—67½ MILES.

Via Guildford (29½ miles) C.T.C. Vol. I., Route 120.

Hogs-back to Farnham (10 miles), Route 138.

Alton ("Swan Hotel" for tea) (9½ miles), Route 153.

Alresford to Winchester (18½ miles), Route 168.

SLEEP AT "GEORGE HOTEL," WINCHESTER.

GOOD FRIDAY, April 5th.

WINCHESTER TO RINGWOOD (lunch) 30½ miles.

RINGWOOD TO SALISBURY (sleep) 17 miles.

Via Romsey (10½ miles), Route 171.

Lyndhurst (8½ miles), Route 171.

Emery-down and Picket Post to Ringwood (11½ miles), Route 176.

Luncheon at "White Hart Hotel," Ringwood.

Via Fordingbridge, Downton Wick, to Salisbury (17 miles), Route 189.

Sleep at "White Hart Hotel," Salisbury.

[NOTE.—Those who wish to take a longer drive in the afternoon can do so by driving from Ringwood through Christchurch to Bournemouth (14½ miles) and back, making a total of 46 miles for the afternoon.]

SATURDAY, 6th April.

SALISBURY TO WEYMOUTH (46½ miles).

WEYMOUTH TO SALISBURY (56½ miles).

Via Thickthorn (15½ miles)

Blandford (6½ miles)

Puddletown (11 miles)

Weymouth (13 miles)

Route 188.

Lunch at Weymouth.

Via Preston and Wareham (18½ miles)

Lythett Minster and Wimborne (12 miles)

Ringwood (9½ miles)

Route 196.

Fordingbridge, Downton Wick, to Salisbury (17 miles), Route 189.

Sleep at "White Hart Hotel," Salisbury.

[Note.—Those who wish a shorter journey can leave the outward road at Blandford (22½ miles) and proceed by Route 191 to Bailey Gate (6½ miles) to Wimborne (4 miles) and home by Route 196 to Ringwood (9½ miles) and Route 189 to Salisbury (17 miles). Total for the day, 59½ miles.]

EASTER MONDAY, April 8th.

Salisbury to Basingstoke, 35½ miles.

Basingstoke to London, 45½ miles.

Via Andover and Whitechurch to Basingstoke (35½ miles), Routes 251 and 206.

Luncheon at "Red Lion Hotel," Basingstoke.

Via Blackwater, Bagshot, Virginia Water to London, 45½ miles, Route 206.

The start from the Club on Thursday, April 4th, will take place at 1 p.m.

It is announced that the Pennsylvania Automobile Club will hold a race meet for motor-cars during the coming summer on a Philadelphia track at least a half mile in circumference.

WE are requested by the Committee of the Automobile Club to announce that the quarterly 100-miles trial will be held on Tuesday the 2nd April. Entries must be in the hands of the Club Secretary not later than Saturday, the 30th inst.

MR. JOSEPH PENNELL had reached Antibes by Saturday evening last on his Werner motor-bicycle. He reports that he had experienced an "awful week but was at last going all right."

ONE of the noteworthy features of recent development in New York has been the erection of fine buildings where stables once stood. The new electric automobile stables in West Forty-ninth Street, occupying a whole block, have relieved the region of the horse taint and odour and dust, and have made it possible to put up handsome buildings on ground that once was hardly deemed fit for the very poorest of the poor.

FROM PONTYPOOL TO BRYNMAWR.

MR. R. J. E. WOOLLEY, of Pontypool, sends us the following interesting account of a run he recently made on his Humber M. D. Sociable, to which he has fitted a new body in front with small detachable hood, improving the appearance, allowing more air to get to the engine, and affording additional space for luggage or parcels.

On Thursday morning, February 21st, I met my client at Pontypool Road Station, and after making short calls at four of our local collieries, we started on our journey to Brynmawr (Breconshire), with a stiff climb in front of us of 1,000 feet, through the town of Blaenavon. Leaving the large iron and steel works of the Blaenavon Company behind us, we soon came to the land of snow, remnants of the last fall which had drifted deep in places, and, with a sharp N.E. wind blowing, were thankful for warm clothing and rugs. A run of about four miles over the top of Coyty mountain, passing Waenavon station on the London and North Western Railway—the highest station in Wales, 1,800 feet above sea level—brought us in sight of our next halting place, namely, Brynmawr. Here the road was in a bad condition, and we had a descent of at least 1 in 4 for about a mile, which very soon landed us in the centre of this Welsh town. For some reason, which I shall

MR. WOOLLEY'S HUMBER "M.D. SOCIABLE" CAR.

never be able to explain, I pulled up in the central square, which is perfectly level, and while my companion went to make inquiries as to the whereabouts of his customer, I kept my engine running. This is a most unusual thing for me to do, for the starting gear being so simple I nearly always stop the engine, when even only a minute or less to wait. He returned in a few minutes, and we had to go up the main street, a sharp rise of about 1 in 8 for 500 to 600 yards. After another stop of some ten minutes or more, I altered my steering wheel to start the engine, when to my amazement I found we had lost the starting chain since our departure from Blaenavon; evidently during the bumping of the last mile's descent the connecting pin had shaken out of the chain, and the latter had dropped off. We had about thirty-four miles to go and four stoppages to make. Time was flying, and I felt sure that if a cycle agent were found who could supply a chain, valuable time would be wasted before one sufficiently long enough could be fitted. Explaining matters, I suggested we should risk it, and try to reach home without a chain. Of course, as we had to descend the street, returning towards the square, I was able to let the car run down by its own weight and throw the engine into gear from the free-wheel towards the bottom of the hill. If I had stopped the engine when we first halted in the square we should have been in an awkward fix, and probably obliged to push behind for about 200 or 300 yards in the most prominent part of the town, an ignominious occupation

to say the least. It was certainly in our favour that the next twenty-five miles were nearly all down hill, descending the western valley of Monmouthshire to Newport. Our little 2½-h.p. De Dion seemed to know we wanted good behaviour, and she simply romped along through Blaina to Abertillery, a growing town in this coal valley, where we stopped about five minutes, while I tried to find Dr. Leon Vint (of Vint Choir fame), who was there with a new 6 h.p. Daimler. I was not, however, successful.

Having been careful to stop on an incline which would be sufficient to give us a start, we soon left behind the vast crowd of inquisitive youngsters, who seemed to drop from the clouds. For about five miles now we had stiff ups and downs, especially one ascent out of Aberbeeg over the railway, which must have been at least 1 in 3, the road being covered with large loose stones. Fortunately it was short, and giving the necessary helping hand here and again in the next village, where we encountered a similar gradient, which, although a smoother surface, was much longer, we were soon gaily spinning away to Crumlin, and passing under the well-known viaduct, which looked like a piece of delicate lattice work, being over 200ft. above us, made our next halt at Newbridge, another colliery village about two miles below Crumlin. After making our last visit to a customer about a mile further on we returned to Newbridge, and dipping under the G.W. Railway by means of a subway recently made, turned our wheels for Newport and made a good run of twelve miles just under the hour, having to halt once to light lamps.

Leaving my client near his residence at Newport, I was not long (about forty-five minutes) running home to Pontypool, a journey of nine miles and all against the collar. The run from Brynmawr, I think, was all the more enjoyable because of the extra excitement of having no starting gear, and I venture to send you this little account for that reason, which may be unique in the motor world.

THE BEST ROUTE FROM PARIS TO ROUEN.

(From our own Correspondent.)

AT a time when many English automobilists are passing through Paris *en route* to or from the South of France it may be of service to trace a route by following which the capital may be left on the north-east side without encountering any very bad stretches of road. The Saint Germain route is that usually patronised by English motorists, but by following it one not only encounters the big hills at Suresnes and La Pecq, but in addition one is required to tackle long stretches of bumpy *pavé*, alternating with patches of truly, villainous macadam. The suburbs of Rueil, Chatou, and Le Vésinet all vie with one another to give the motorist a real good jolting, and in this endeavour I am bound to confess that they succeed to admiration. The automobilist comfortably ensconced among luxurious cushions and cradled on the easy riding springs of a car, receives a thorough shaking, while the unhappy motor-cyclist is literally slaughtered, and for some days after his excursion over this route he cannot sit down without a groan. A considerable portion of the *pavé* may be avoided, it is true, but this means *détours* to right and to left, thus tending to confusion when one does not know intimately the geography of these Parisian suburbs. Now the route which I have always found to be the most practical is that by way of Maisons Lafitte. True, there exists from end to end the "tramway de la mort," as motorists and cyclists call the line of tramcars connecting the capital with its horsey suburb, but personally I consider the danger considerably exaggerated. The only really awkward place is at Sartrouville, just before reaching Maisons Lafitte. There the route crosses the Seine by means of a bridge so narrow that the two lines of tram rails occupy the whole of the available space, and a vehicle might be nipped between a couple of tramcars. Then, too, after traversing the river, the route turns sharply to the left, and one is apt to overlook the existence of a raised portion of the road, upon which the tram lines are laid. Once mounted upon that the car has to be backed off, or bumped directly down on to the roadway.

These places are undoubtedly awkward, and one or two accidents have already occurred upon the bridge. The most recent of these happened about a month or so ago, and it might well have given rise to serious results. It was the old story over again. The driver of a carriage, seeing a tramcar at rest upon the further side of the river, proceeded to cross the bridge, expecting to get over before the car re-started. But the tramcar unfortunately did not remain long enough at rest, and entering upon the bridge it eventually nipped the carriage, there not being sufficient room for the latter to pass. By a miracle the driver was not hurled over the parapet into the river, but the vehicle was smashed up pretty considerably. But the bridge is the only dangerous spot, and the route presents a surface considerably better than those of the majority of main roads running out from Paris. To utilise it one should pass by the Porte Maillot either through the Bois de Boulogne or the Avenue de Neuilly to the Seine. There, without crossing the river, turn to the right and proceed straight ahead until the Pont Bineau is reached. Cross this and then follow the tram lines through Colombes, Bézons—where one again crosses the Seine—Houilles, and Sartrouville. Throughout the route is quite easy to follow. Immediately after crossing the bridge at Sartrouville, Maisons Lafitte is reached, and after climbing the hill which leads to the centre of the town one turns to the left and heads for the railway station. After negotiating the railway bridge the route branches off to the right, and leads the motorist through some of the lovely scenery of the forest of Saint Germain, past the Croix-des-Noailles, famous in motor annals as the scene of the Paris-Roubaix race accident. Driving straight ahead one enjoys a delightful run all down hill into Poissy, the railway level crossing on the outskirts of the forest and a bad *caniveau* at the entrance to the town being the only places calling for the driver's particular attention. At the railway station in Poissy turn to the right, under the railway and over the river bridges, and a straight road leads to Triel. The intricacies of this quaint old place call for slow driving, and in the heart of the town one turns sharply to the left and crosses the suspension bridge, pulling up for a moment to pay the toll. One then traverses Verneuil, where there are two *caniveaux*, and half a mile further on a nasty turn to the left requires careful negotiation.

The road then leads through a pretty wood, upon emerging from which Meulan is seen in the distance. A mile from the town the road bisects and that to the right should be followed. A very awkward bridge has then to be passed, but, once over it, a very short run brings one to Meulan. Upon entering the town turn to the right, cross the two bridges, and after the second turn immediately to the left, as by this means a stretch of *pavé* is avoided. From Meulan to Mantes is a straight run over a grand stretch of road, and once in the latter town the route to Rouen is readily ascertained. Such is the route which I have found to be the best, and by following it English motor men will avoid much of that terrible road surface which abounds on every side of Paris.

AN Easter tour, to extend over five days, is being organised by the Liège Automobile Club.

MR. WILLIAM LEA, of Birkenhead, Liverpool, reports that the car he has placed on the market has proved itself in the hands of purchasers what he claims it to be—a thoroughly reliable and good hill-climbing machine at a comparatively low price.

THE General Automobile Agency makes the fourth show-rooms opened in Long Acre, W.C., by motor-car makers and dealers. Long Acre will, considers the *Coachbuilders' Journal*, eventually be the mart for motor-cars as it is for horse-drawn carriages.

A GENERAL meeting of the members of the Lincolnshire Automobile Club was held last week. It was reported that the Club had been affiliated to the Automobile Club of Great Britain and Ireland, and it was decided that Mr. W. R. Pennell and Mr. W. B. Jevons were elected representatives on the Motor Union. It was decided to meet with the N.C.U. in respect to the improvements of guide-posts, etc. It was decided to take action in connection with the removal of the tare limit on heavy vehicles.

CORRESPONDENCE.

A PERFECT TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My previous letter described a motor-carriage for one person that was to defy the elements and afford protection in bad weather and in exposed situations to the occupant—in fact, a motor bath chair, which to a country doctor who has to turn out of bed and go out in all weathers would be invaluable. My present letter, however, refers only to a motor that would give the most satisfactory results as regards speed, security from breakdown, and general handiness. Is there any well-known and reliable firm of bicycle and tricycle manufacturers prepared to make a motor-tricycle answering the following description:—

The front wheel to be a Singer motor wheel, procured, of course, from Messrs. Singer, of, say, $2\frac{1}{4}$ or $2\frac{1}{2}$ h.p. The fork to be a duplex fork, similar to many motor-tricycles, and the head to be a Referee head, and the frame to be a combination of the Referee and Marriott frames, that is, it must be a triangulated frame like the Referee is now advertising, but must be forked over the gear case, as in the case of the Marriott tricycle, so as to bring the pedalling gear into the centre of the machine. It must also have Marriott's double band brakes, operating on drums on either side of the gear. The machine to be an optional free wheel machine, that is, it can be used as free wheel or not, as the rider pleases. The tires to be Palmer tandem tires with non-puncturing inner tubes, with non-puncturing bands not only against the outer cover, but also against the steel rim. The saddle pillar must be a Vincent non-vibratory saddle pillar, and the handle bars must also be non-vibratory. The motor wheel must be made to take in and out so that an ordinary wheel can be substituted when the motor is not required. This wheel can be sent on when touring, so that when staying at the sea-side, for instance, where only short rides are taken and exercise is desirable, the machine could be used as an ordinary tricycle.

The advantage of such a tricycle as I have mentioned is obvious. The duplex fork and double head give great strength and rigidity. The Referee frame gives a like result. The Marriott system of forking the frame centralises the gearing, reduces friction and side pull. The double band brake operating on either side of the gear is very powerful in action and very true. Non-puncturing tires afford an immunity from deflation. The saddle pillar reduces vibration, and the power of removing the motor wheel allows the machine to perform a double purpose. Such a tricycle would, indeed, be perfect. Would any manufacturer make one, and, if so, what would be his price?

It must be understood that the motor wheel when not in use must run absolutely free; the machinery must, in fact, be disconnected from the tricycle, so that the tricycle would descend hills of its own momentum, and when the tricycle was worked with the pedals the motor wheel would revolve without operating the engine, the tricycle would, in fact, be equal to one having the De Dion clutch. A motor which has to work down hill is an absurdity. This tricycle should not be very heavy; the frame, since it is scientifically planned, need not be cumbersome; the heaviest part would be the motor wheel. It should be easy to pedal.

Trusting to hear that some of your readers who are manufacturers, consider it feasible to produce such a tricycle,

Yours truly,

ATHOL MAUDSLAY.

GEARS AND IGNITION FOR MOTOR-QUADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Chum" in your last issue, I should say there is no such thing as the "correct" number of teeth to have on the pinion of the motor-axle. That point should be determined by experience, showing what is best for all round work of different powered engines. I have in use the smallest pinion made for Aster $2\frac{1}{2}$ h.p. motor (twelve teeth). But with two riders on my quad I could not get comfortably up hills, described in the Contour book as 1 in 17, until I had a two-speed gear fitted. "Chum" may be quite sure that these small motors cannot

negotiate hills at all steep, when driving a quad with two on, unless with the attachment of a two-speed gear—and that is the proper and only solution of the problem.

I should like to give a word of warning here as to the danger of over-straining when assisting a quad up stiff hills by pedalling. I know a man who ruptured himself last summer in this manner. I have done away with my pedals, chain, etc. There is no real necessity for them with a two-speed gear in use, besides their being a source of bother and annoyance in all sorts of ways. There are more advantages without them than with them, at least, so I find now.

Van Raden's woven glass accumulators are very good. At any rate mine is very reliable, and judging from experience, I say mine would work for quite 700 miles, if not more. As to recharging, all electric supply stations will not charge accumulators. But there should be no real difficulty in the matter, wherever the continuous current is in operation. One can charge it oneself from a switch, when one has once been shown the way. I find it takes about four minutes to fully charge mine, costing about 2s.

I am thinking of having a small dynamo fixed to my quad, to be driven by a belt from the end of the motor shaft, so that as the motor works it would drive the dynamo, and so keep the accumulator constantly charged up. Can any of your readers kindly give experience in this particular matter?—Yours truly,

G.

A SUGGESTED NEW CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As motor-cars are a luxury "to the many," would it not be a good idea if some enterprising persons, preferably yourselves, formed a motor-car club in London (to start with), all members to pay a yearly subscription and a small sum to the repairing fund of the club, in return for which members should be entitled to use a car, say, four or more days a month, and as members increased, motors and the number of days (if possible) allowed per member shall be increased also?—Yours truly,

NOVICE.

THE BOLLEE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am obliged to Mr. Hickman for his kind information. In reply to "Inquirer," I do not think there are any English agents for the car, but full particulars could probably be obtained from the maker, Leon Bollée, 163, Avenue Victor Hugo, Paris. I do not know the price, but secondhand cars can be picked up at very reasonable rates at many of the big dealers', and it is this fact and the neat appearance and cheap maintenance that strike me so favourably. I shall be glad if Mr. Hickman or some other reader would give further particulars, such as: (1) Is the braking effective? (2) Is the driver's view interfered with by the front rider? Both seats seem to be on the same level. (3) Is the car given to bad side-slipping? (4) Does the belt driving give trouble?

Mr. Hickman seems to consider the running cost of .6d. per mile as very cheap; it does not compare very favourably, however, with the cost of .3d. claimed by the Benz people.—Yours truly,

ZERO.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think it would be a very great improvement if motor-bicycles could be made with a jockey pulley, controlled from the handle-bar, for the purpose of starting the bicycle by means of the motor, when one is mounting the cycle half-way up a slope. It seems to me doubtful whether the motor-bicycle can compete successfully with the motor-tricycle, owing to the latter's ability to climb very steep hills slowly, when fitted with a hill-climbing gear. I should also like to see motor-tricycles made narrower, now that the necessity of running back, and turning sharp round when starting on a hill, is being done away with by the introduction of the free motor. Yours truly,

CECIL JACKSON.

BRIGHTON POLICE AND MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be pleased if you would publish the particulars of the following iniquitous fine imposed on me by the stipendiary of Brighton for alleged furious driving, viz., fourteen miles an hour, on Saturday, the 9th inst.

The case came on Thursday last week at Brighton Police Court. I did not trouble to have Mr. Staplee Firth to defend me, for which I am now truly sorry, thinking the case was such a simple one, and having seen a similar case disposed of at Hove only on Monday, the 11th (viz., Mr. Gladding's), for 5s. and costs. The facts of the case were these:—I had only taken my car from the carriage builders' hands that day, and it was the first time that it was out. I was quite unaware that any policeman had noticed me or that I was driving any faster than usual (I have driven a motor-car for the last eighteen months and never been spoken to before) till they stopped me on the Sea Front, and asked me whether I was aware of the time I had taken to do a certain distance. They informed me they had timed me, and that I was travelling at fourteen miles an hour, and that they would report me at the Town Hall.

Now you have often held up to ridicule the way the policemen have timed unfortunate motorists, but I think that the following is unique. At the junction of Madeira Road and

THE ROCHET VOITURETTE.

AS a kind of intermediary between their motor-quadracycle and their 6 h.p. light car, La Compagnie Générale des Cycles et Automobiles (Rochet-Petit), of Paris, have lately introduced a two-seated voiturette, of which we are able to give an illustration. The frame is of tubular construction, suspended, fore and aft, by springs on the axles; on the frame is fitted a comfortable body having seating accommodation for two persons. The motive power is supplied by an Aster water-cooled motor of 4 h.p. Ignition is, of course, electrical, while the carburettor employed is of the well-known Rochet spraying type. The circulation of the cooling water is maintained by a small pump, a radiator being also provided.

As regards the transmission gear, this is very similar to that adopted in motor-quadracycles, the engine being located at the rear, and geared direct to the rear axle through the medium of a friction-clutch and a two-speed gear. The latter is entirely enclosed in a dust-proof oil-containing case, and it is pointed out that on the high speed the engine drives the car direct, none of the additional pinions being in gear. Steering is controlled by an inclined hand-wheel, on the standard of which are mounted three little handles for regulating the gas mixture and for varying the ignition. A hand lever at the side controls the clutch

THE ROCHET VOITURETTE.

Marine Parade is the Brighton Aquarium, on the tower of which is a notoriously bad time-keeping clock. The policemen watched me drive along the Madeira Road and stopped me on the Marine Parade. They were standing at least 200 yards from the afore-said clock when they stopped me, and they took my time from this clock and at that distance, and moreover the magistrate accepted this as proof of my furious driving, and imposed a fine of £5 11s. 6d.

This magistrate had a day or so previously imposed a fine of 10s. only on a drunken man whom it was acknowledged had driven to the danger of the public and also had annoyed a motor-cyclist, but whose defence was that he hated motor-cars, and that his temper was more to blame than drink. This case was reported in your last issue.

I have since written to this gentleman (the magistrate) offering to give him a run on my car to cure him of his prejudice, but, as might be expected of such a man, he has not had the politeness to answer.—Yours truly, FRITZ MÜHLENKAMP.

THE British Motor Traction Company write:—"We are pleased to note that Mr. Friswell has been frank enough to explain that the letter which appeared in a recent issue purporting to be a copy of a letter sent to the British Motor Traction Company, had never been written to that company, nor did the original of Mr. Friswell's copy exist. My Board appreciate his straightforwardness in telling your readers the truth of the matter, and thank him accordingly."

and change-speed gear, the second hand lever actuating band brakes on the hubs of the rear wheels. The foot pedal seen in the illustration operates a hand brake on the differential gear. The road wheels are of the cycle type, 23 in. diameter, and are shod with 65 mm. pneumatic tires. The car measures 7½ ft. by 3½ ft., and weighs about 5 cwt. On the low gear it will, it is claimed, mount any ordinary hill, while any speed from five to twenty-five miles an hour can be attained.

THE Automobile Club propose to appoint a sub-committee to prepare schemes in connection with the demonstration of motor-vehicles before County Councillors on Thursday, Friday, and Saturday, 6th, 7th, and 8th June.

MR. A. BURGESS, of the Lightning Motor Works, of Barnard's Green, Malvern, informs us that he has arranged to keep his premises open day and night. He keeps a stock of petrol and motor accessories of all kinds, and is well equipped to carry out any necessary repairs to motor-cars.

THE English Motor Club evidently intends to give the holiday crowd at the Crystal Palace on Easter Monday plenty of excitement, and if we mistake not there will be a general rush for the track at the hour fixed for the motor meeting. One of the most interesting events should be the five-miles pursuit match between Messrs. Jarrott and Maltby, each driving 10 h.p. De Dion racing spiders.

THE BELGIAN MOTOR-CAR EXHIBITION.

(From Our Own Correspondent.)

THE annual exhibition of automobiles, motor-cycles and cycles was opened on Saturday last, the 16th inst., at the Pole Nord, Brussels. The building, which is a hall connected with the market, is of very respectable size, but every inch of available space, both down stairs and in the galleries, has been filled up, and it really looks as if there were not room for a single car more. I have analysed the list of exhibitors and find there are 63 Belgian and 43 foreign firms.

The exhibition was inaugurated by H.R.H. Prince Albert of Belgium, who arrived at two o'clock accompanied by his aide-de-camp, and was received by M. de la Charlerie, the president

FIG. 1. THE DECHAMPS TONNEAU.

of the Société Royale Union Auto-Vélocé de Belgique, under whose auspices the exhibition is held. The Minister of Industry and Labour and his First Secretary were also present, as also M. de Motte, the burgomaster of Brussels. The inauguration consisted of an official visit by the Prince to all the stands, at each of which he was received by the representative manufacturer. In this interesting little country the King and the Prince are personally acquainted with nearly all the heads of firms, and as I passed round with the official party I was struck with the evident familiarity and friendly terms on which the Prince seems to be with his people. One big maker remarked to me, "The only thing that makes him a little shy is that he is afraid one of us will sell him a car." M. Verstraetan, the president of the Belgian Automobile Club, received the Prince in the room set apart for the Club and had a cordial interview with him, and after spending two hours in the show the Prince drove away at four o'clock, expressing great satisfaction at what he had seen. I asked a manufacturer why the King slighted his own countrymen by buying his motor-car in Paris, when he could buy one just as good, if not better, at home. He replied, "Oh, he always likes an excuse of some kind to go to Paris." It strikes me there are many others besides the King of Belgium who like to have an excuse for a trip there now and then! The show shows a decided progress over the one held in this same building last year. The advance is most noticeable as regards the higher-powered cars—what I may call the mastodons of automobilism. This time last year the 12 h.p. was almost unknown, whilst this year I noticed both Belgian and French 12 h.p. Daimlers, and at least five other makes of 12 h.p. cars, and even a 40 h.p. motor.

The most important exhibit is undoubtedly that of the Belgian Daimler Company, or as it is called La Société des Ateliers Germain, with all the well-known forms of 6 h.p. and 12 h.p. cars, both open and closed. The great feature of their exhibit is, however, a new 12 h.p. racing car weighing about 18 cwt., very rakish in appearance. Great things are expected

of this car, and I hope to have an opportunity of describing to you my experiences of a run on it, as the owner has promised to take me out as soon as the car is in thorough trim. Amongst the mastodons I noticed a 12 h.p. Mors, a combination petrol-electric car by Jenatzy, with accumulators to start the engine and help it along, whilst in its turn the engine charges the accumulators; a new 12 h.p. Pipe car by the Compagnie Belge de Construction d'Automobiles on the lines of Panhard and Levassor; and a lorry and a very heavy-looking six-seated car by Vincke, of Malines. The Société Generale Belge des Automobiles exhibited also a Daimler. In a corner just behind the exhibition of the Ateliers Germain I noticed the novel and ingenious incandescent platinum tube without a burner which was exhibited at the Paris Salon, and which has already been referred to in the *Journal*. The incandescence is maintained by carburetted air impinging on a thin wire of spongy platinum. All danger of the wind blowing out the burner is done away with, as also all danger of fire, for petrol may be poured on it without ignition. A good show of batteries and electrical accessories is made by the Meyra Electric Company, Ltd., of London. The company are establishing works over here for the manufacture of batteries for the Belgian market.

In smaller petrol cars the would-be purchaser is spoiled with choice—all more or less approaching the same outlines—engine in front, wheels of equal diameter, a universal joint to replace the chains, and above all a *tonneau* body. Amongst the smaller cars I noticed Pieper's new 6½ h.p. light carriage, with two cylinders, Panhard gear, and, of course, *tonneau* body; but Pieper continues to use chains, and does not believe in the universal joint. Les Usines Delin, of Louvain, have a good little two-seated car, fitted with two speeds and reverse and 2½ h.p. engine, for £112. La Société la Metallurgique, of Marchienne-au-Pont, has quite an assortment of cars, and a new motor which promises great things.

Dechamps, who is at present giving a series of lectures under the auspices of the Moto Club, has also made great progress. Fig. 1 shows the new Dechamps *tonneau*. It is fitted with a two cylinder 6 h.p. motor, three speeds and reverse. Among the larger cars I should have mentioned the Gobron-Brillie, which seems quite a favourite in Belgium.

I noticed a very handsome covered vehicle made by the Fabrique Nationale d'Armes, Herstal, in which the driver is quite inside the car and behind bevelled glass windows, and surrounded with very luxurious fittings. This firm have already supplied the Shah of Persia with a handsome landau. In electric carriages Krieger's is the only stand of importance, showing all his well-known forms of open and closed vehicles, with the motors on the front wheels.

FIG. 2.—THE PEUGEOT NEW LIGHT CAR.

Messrs. Antoine Fils and Co., of Liège, make a big display of Kelekom petrol motors, ranging from 2½ h.p. to 10 h.p. Les Ateliers Lion, of Enival, Verviers, has on view a number of little belt-driven motor-cars, already well-known in England. The Peugeot Company show several of their latest types of vehicles, including the 5 h.p. car with engine in front (Fig. 2). A new 6 h.p. light car is shown by M. E. Pinart, of Brussels. I hope to send you particulars and illustrations of this later on.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

A 5 h.p. air-cooled engine and a new carburettor are to be seen on the stand of M. Fordart, of Cureghem.

I noticed a Locomobile steam-car and also a steam-car of the Serpollet boiler type made by Miesse and Co., of Brussels. It was this car which last year made a record run at the speed of 74 kilos. an hour. This vehicle is very elegant in design, and I shall watch its future development with considerable interest. The Minerva motor-bicycle made by an Antwerp firm, and very compact and well finished, figures as an important exhibit. The motor is in the frame below the rider and drives the hind wheel by means of a thong of untanned leather. I did not see a single motor-tricycle or a quadricycle. Bicycles were very poorly represented too, and, as this used to be a cycle show entirely, it is quite a sign of the times to see how the motor has quickly absorbed a great part of the attention which used to be devoted to the bicycle and has taken its place. Altogether the Belgian *salon* is well worth a visit and fully demonstrates the fact that the motor trade is getting now into practical grooves taught by actual experience and which promise to lead to a satisfactory and steady future trade.

A NOVEL TWO-WHEELED ELECTRIC VEHICLE.

AN electric vehicle that possesses some interesting and rather unique features, and which reminds us of the old Otto bicycle, has recently been constructed by Mr. A. B. Holson, of Chicago. It consists of a seat and carriage frame

suspended between two large wheels, and a good general idea of its construction may be obtained from the accompanying illustration, which shows the vehicle and its inventor.

Mr. Holson believes that the main improvement in his vehicle over other automobiles is the fact that he uses such large wheels. In passing over rough roads the jar of the battery of accumulators is greatly lessened. The inventor says:—"The reason that batteries give out so quickly in automobiles is that the vehicle shakes the batteries so badly that the active material drops out, and there is a tendency to short-circuit the battery. I overcome this by having such a large wheel. When I am driving my machine fast the wheels are turning comparatively slowly, as the vehicle advances 20ft. during every revolution of the wheels. On ordinary dirt roads each wheel makes contact with the ground for a distance of about 11in., which makes the car run steadily and steer easily. In testing the machine I passed

over a 6in. by 6in. block of wood very easily, hardly noticing any swinging to one side, as one would naturally expect a two-wheel vehicle of this sort to do. Other advantages of my vehicle are that it only occupies a small amount of room; it is harder to tip over in rounding a curve or surmounting an obstacle; it can be manufactured more cheaply, and there is no noise heard from the gearing, as the motors are in the hub."

Probably the most important part entering into the construction of the two-wheeled car is the motor. Each wheel contains an electric motor in its hub, and the mounting and gearing are of new and unique design. The motor is placed crosswise of the axle, with a pinion on each end of the motor shaft. The pinions operate on opposite sides of a two-faced bevel annular gear, fastened to the hub of the wheel, and is turned by the revolution of the motor, the field frame of which rests in ball bearings in the hub frame. The conducting wires from the battery are run through the hollow axle to the motor, and the latter is entirely encased in a malleable iron case. The gearing is thus not exposed to the elements and dirt. The motors are multipolar and series wound, and while each is designed to develop one horse-power under normal operation, the inventor asserts that they can be forced to give a maximum of four horse-power each when necessary. The diameter of the entire hub casing is 13 inches, while the wheels of the vehicle, which are of cycle construction, are 6ft. 3in. in diameter. The rim is of iron, built with a groove for a 2in. solid rubber tire. When the photograph was taken no tires were in place on the wheels. The inventor had been using tires formed of rope as a temporary expedient.

The storage battery weighs 1,200lbs., and being suspended below the axle and at the lowest part of the frame, serves to keep the seat right side up. In fact the bulk of the weight is at such a distance from the axis of the wheels that it steadies the vehicle and there is scarcely any tilting of the seat. In this way the weight of the storage battery is made use of for a good purpose, and, in fact, is indispensable to the successful operation of the machine. The battery at present used in the vehicle consists of forty cells of the Helios-Upton type, having a capacity of 30 amperes at a three-hour discharge rate. The motors are operated in series, and by means of a controller four speeds are obtained. Mr. Holson has driven his vehicle at a speed of sixteen miles an hour, and says that one charge of the battery will propel it for forty-five miles. The motors take from 15 to 23 amperes of current under normal operation.

The vehicle is steered by means of a pair of mechanical brakes of the friction type, one on each hub. These brakes are operated by means of a leather strap held in the right hand of the operator. The action is similar to that used in guiding a horse by means of reins. By pulling on the right hand portion of the strap the brake on the right wheel is tightened, thus slowing down that wheel and permitting the vehicle to turn to the right. The machine is turned to the left by pulling on the left line in a similar manner. Pulling equally on both lines will set the brakes on both wheels and stop the vehicle. The vehicle is said to be steered admirably in this manner. When the power is first turned on the front of the vehicle is lifted a trifle and held there while the power is on. There is said to be no pendulum movement to the vehicle when in motion. When the vehicle is stopped an iron rod is let down under the front platform to hold it while the passenger is getting in or out. The brake mechanism is described as being such that the operator can stop the vehicle within a very few feet when going at full speed. The entire car weighs about 2,500lbs. with two persons in the seat. Steps are, it is stated, to be taken immediately to manufacture the vehicles and place them on the market.

THE members of the Cyclists' Touring Club, at their meeting last week, rejected the proposals that the articles should be altered so as to include automobilists.

THE East Coast Automobile Co., Ltd., has been registered with a capital of £2,000, to carry on the business of motor-car and automobile owners, hirers, and letters on hire of automobiles, etc. The registered office is The Gables, Mill Road, Cleethorpes.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

HERE AND THERE.

M. SERPOLLET left Paris for Nice on Saturday last on a special steam racing car, one of three that have been entered for the race meeting at Nice.

THE Cross of the Legion of Honour has been conferred upon M. Bouton, the veteran automobile mechanic, and partner in the firm of De Dion et Bouton.

THE *Course du Catalogue* has again had to be postponed owing to the bad state of the roads. It will now be run off in April, after the Nice week.

THE Union Automobile de France has resolved to organise an excursion to the Loire, starting from Paris on May 15, and returning on May 20.

THE Austrian Automobile Club have unanimously elected Mr. Roger W. Wallace, K.C., the Chairman of the A.C.G.B.I., an honorary member of the A.A.C.

EFFORTS are being made to induce the Comte De Dion to read a paper on Automobiles at the Engineering Congress in connection with the forthcoming Glasgow Exhibition.

THE Truck Automobile Company, of New Haven, Conn., has been incorporated to manufacture and deal in vehicles propelled by compressed air or electricity. The capital is £200,000.

VISITORS to the recent motor-car exhibition in the Grand Palais, Paris, will be interested to learn that the beautiful building was last week the scene of a cattle show. The Agricultural Hall over again!

MESSRS. ELDIN AND LAGIER, of Lyons, have sent us a copy of their new catalogue, which gives illustrations and particulars of their 20 h.p. car, four cylinder petrol motor and two-cylinder ditto, change speed gear, carburettor, pump, etc.

IN connection with the projected corps of Automobile Volunteers, the following additional names have been received:—Mr. John Bolton, 12 h.p. Daimler; Mr. Ballin Hinde, 12 h.p. Benz; Mr. Noel B. Kenealy, 10 h.p. Delahaye; Mr. F. R. Simms, 20 h.p. Berlin Daimler; Mr. Ernest de Wilton, 3 h.p. tricycle.

THE Sirdar Rubber Company appear to be meeting with considerable success with their Irel Buffer solid rubber tires, which are being used by several public service companies. The tire is so made that the rubber cannot get cut on the edges of the rim, and so waste away; all the rubber acts as a cushion without interruption from the edges of the rim, thus giving longer life to the surface.

THE opening of the exhibition of motor vehicles and accessories which is being held under the auspices of the Reading Automobile Club is fixed for Tuesday next, the 26th inst. The show, which is being held in the Reading Corn Exchange, Market Place, Reading, will remain open until the 28th inst. It should give a filip to the automobile movement in the Reading district.

SIR COURTANEY BOYLE has an entertaining article in this month's *Macmillan's Magazine* on "The Coinage of Words," and incidentally refers to the nomenclature of automobilism. He says that "motor" is better than "auto-motor," and suggests "kion" or "auto-kion" as a substitute for "automobile," "auto-car," "motor-car," or other methods of indicating a self-moving vehicle.

THE Gorton Cycle and Motor Company Earlsdon, Coventry, have secured the whole of the stock and patterns of the Beeston motors, and are now in a position to do repairs to motors and motor-tricycles of this description. The business is being managed by Mr. Gorton, jun., who rode from London to Brighton on the first English-made motor-tricycle.

A MEETING of the creditors of J. H. Swift, of Whitwick, retired licensed victualler, was held at Derby last week. The liabilities amount to £145, and the assets to only 10s. The debtor states that his failure is due to his having purchased a motor-wagonette, which was not capable of working and being let out on hire as represented. The sellers refused to take it back and refund the £50 deposited.

MESSRS. R. J. Meccredy and Co., Ltd., of Dublin, have sent us a copy of the little booklet they have lately issued, entitled 'The De Dion Voiturette: Its mechanism, and how to drive it.' It is a reprint of a series of articles which appeared in the Irish

motor magazine, the *Motor News*, and is written in simple, non-technical language for the benefit of beginners. A number of pages are devoted to instructions, "Before Starting"—how to start—and "How to Drive." Then follow chapters on "Care of the Car," "Roadside Troubles," "Electrical Ignition," etc. The little work is one that can be recommended.

IN their report laid before the London County Council last week, the Fire Brigade Committee gave some details of the progress of their experiments in the use of liquid fuel for fire engines. On Oct. 24, 1899, the Council authorised the expenditure of a sum not exceeding £100, to enable the chief officer to try with a steam fire-engine the fittings invented by the Clarkson and Capel Steam Car Syndicate (Limited), for the use of oil fuel. The committee are of opinion that, with a view to a proper comparison being made, the Clarkson system should be tried with a second fire-engine, and they have received from the firm an

REDUCTION OF THE AUTOMOBILE CLUB EXHIBITION POSTER.
(PRINTED IN FULL COLOURS.)

offer to supply and fit for £80 oil fuel apparatus to No. 73 steam fire engine. They accordingly recommended this expenditure being incurred.

A WAGER which is interesting because it involves two important questions in motor-car construction—weight of machine and maximum speed, has been arranged between M. Charron, the well-known French *chauffeur*, and M. Canello, of the firm of Canello-Durkopp. M. Canello undertakes to deliver within three months an automobile of seventy h.p. weighing not over 1,200 kilogrammes (1 ton 400 lbs.) and attaining a rate of speed of 120 kilometres (seventy-five miles) an hour. The trial must take place over a course of 100 kilometres and during two kilometres the speed of 120 kilometres must be reached. If these conditions are not fulfilled Canello will pay Charron the sum of 10,000 fr. (£400), while, on the other hand, this sum will be paid by Charron should Canello succeed.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE SIMMS 6 H.P. PETROL MOTOR.

THE accompanying illustration shows the new Simms 6 h.p. water-cooled motor; it is the outcome of many years' experience of gas and oil engines, and, owing to the unique results obtained, is claimed to possess many important advantages over any hitherto placed on the market. The motor, which is entirely automatic in its action, is fitted with the Simms-Bosch magneto-electric ignition. There is no open flame whatever, consequently no possible danger of fire or explosion. The motor is, moreover, fitted with Simms' timing gear, by which the time of the ignition can be advanced or retarded, thus enabling the speed of the motor to be altered at will, the maximum being about 1,500 and the minimum about 200 revolutions per minute. The spark may be observed through a specially provided sight-

hole. When running at 1,000 revolutions per minute the Simms motor gives 6 h.p., and at 1,200 revolutions per minute 7 h.p. By means of a constant level float-feed the supply of petrol to the motor is rendered entirely automatic, no regulation of mixing valves being necessary.

An inlet-valve regulator is provided, which not only effects a great saving in fuel when the motor is not required to do its full work, but enables the lowering of the speed independently of the timing gear. The engine is very simple in construction, and the valve arrangement is so designed as to be very readily accessible. Automatic lubrication and proper bearing surfaces are also a main feature. As regards the water-jacket, it may be mentioned that the cylinder-head and cylinder are cast in one, so that there are no water joints to make. The diameter of piston is 110 m.m., and the stroke of piston 100 m.m. Complete and ready for running and including magneto-machine, float-feed, vaporiser, etc., but exclusive of flywheel, the engine weighs eighty-two lbs.

We learn that Mr. Charles H. E. Rush, of the London Autocar Company, has taken out a licence as a valuer of motor-cars, motors, etc.

The business of Messrs. Delahaye and Co., of Paris, the well-known motor-car builders, has been registered as a company with a capital of £32,000.

MESSRS. FRISWELL, LTD., will shortly open the premises at 1, Prince's Road, Holland Park Avenue, W., as "The Automobile Tattersall's." Storage will be available there for about sixty cars, and five mechanics will form the staff, ready to carry out motor repairs of any kind.

SOME AUTOMOBILE EXPERIENCES.

THE March House Dinner of the Automobile Club was held on Wednesday, the 13th instant. After the dinner a discussion on "Some Motor Experiences" was opened by Mr. Henry Edmunds, M.Inst.C.E., M.I.E.E. The following is an abstract of Mr. Edmunds' paper:—

My first experience with motor-cars began—1897—as is often the case, with a De Dion tricycle, with its air-cooled cylinder, electrical ignition, surface carburettor, and control effected by varying the mixture, or altering the period of firing, or not firing at all. The experience gained was certainly very useful; and I think that any man who can comfortably manage a De Dion tricycle has gone a long way towards mastering a good many of the difficulties common to all petrol motors and explosion engines.

Governing.—The alteration of the mixture, however, for purposes of varying the speed is not desirable. There is only one proper mixture when true combustion takes place, when there is an absence of smell, and when you attain the best results. The excess of air or excess of petrol often cause great annoyance to the public, owing to the smell. I therefore think that this mode of governing an engine by varying the mixture is very undesirable; and the constant mixture engines, such as the Daimler, with a centrifugal governor which entirely cuts off the charge instead of varying the mixture, are, from this point alone, very much better than the other type of engines.

We are not here to discuss improvements in engines, but I think the right direction for the governing of an explosion engine will be, not by varying the mixture as in the De Dion type and not by cutting out a cylinder or cylinders as in the Daimler, which is apt to give an intermittent turning movement, though probably very economical as regards the consumption of petrol, but we must seek to govern by varying the compression according to the work demanded from the engine, keeping our mixture of petrol and air constant, but altering the amount of mixture according to the demand.

Ignition.—The ignition or firing question is one of considerable importance. There is no doubt that great differences are caused by firing, and it is important that the firing should occur at the proper moment. In electric ignition this is comparatively easily arranged for. By moving the commutator you can advance or retard the sparking. In the tube ignition, however, the conditions are different. If you fire too early with tube ignition you are apt to have a bad back-stroke in starting your engine. Some people have gone as far as, after lighting the burners, seeing that they are in good condition, and working properly, to then momentarily turn them down, slightly cooling the tube, and thus making it fire a little later and getting rid of the shock. In electric ignition, all this is under most complete control. You set your commutator to fire late, which enables you to start your engine with great comfort, and then you can regulate the firing earlier until you get to the best condition. In engines with two or more cylinders, if care be not taken, one may get a sort of mean, instead of the maximum, due to the contacts on the commutator not being in the exact position to produce the best results in each cylinder. The experiences of some friends (especially Mr. Bradley's, which are very remarkable), of the difference between tube and electric ignition on a large sized gas engine used for power purposes, have an important bearing on the subject now before us.

I referred just now to the question of compression in tube firing; but the question of compression in electric firing is very interesting. As probably some of you are aware, I have written to the journals, calling their attention to some observations I made some time back on this point. I had had unsatisfactory and intermittent firing in my Daimler and removed one of the plugs to see what was the matter, thinking probably it had become covered with oil and grease. To my surprise it was clean and in good order, and sparked freely when I tried it in the atmosphere. I noticed that the air-gap was fairly wide, about a sixteenth of an inch. I closed the space to about a thirty-second, replaced the plug in the cylinders, and the firing was all that could be desired. On considering the question, I concluded that the pressure in the cylinder had a good deal to do with the distance that the spark could jump. Roughly, the four-volt primary on, say, a Blake induction coil will in the air give on the secondary a $\frac{1}{4}$ -inch spark at atmospheric pressure. When, however, the compression is carried up to ten atmospheres the same spark will not jump a millimetre. It is, therefore, very important for those who are using electric firing to see that the air-gap is not too wide. I think, however, we are often minimising the battery a little too much, and unnecessarily. Under ordinary conditions, four volts may be enough; but an extra two volts is well worth trying. You find your firing is freer and more uniform.*

Batteries.—All things considered, I think the secondary battery or accumulator has most to commend it, especially where you have a convenient source for recharging available. The voltage with lead couple is about two volts, and two couples or four volts are generally enough.

Ignition Plugs.—I have used with considerable success both the ordinary De Dion and the Reclus plug, and also a form employed in the Decauville. This, though rather more delicate than the shorter ones, has the advantage of being easily and readily repaired in the event of the porcelain fracturing. It is a curious thing that many porcelains break away when first used; but if they survive their infancy their length of life is indefinitely prolonged; and I have very little trouble through these breaking down.

* Mr. Edmunds made very interesting experiments to show that though a spark may be good under ordinary atmospheric pressure yet under compression no sparking took place.

Position of Plugs.—As to the better position for the plugs, at the top or side of the cylinder, I think there is no doubt about the latter being better.

Stopping and Starting Engine.—One advantage of electric ignition is that under suitable conditions you can stop and start your engine without having recourse to turning by hand. In order to do this it is only necessary to arrange that before the stopping of the engine you open your battery circuit. This causes the firing to cease. Meanwhile the momentum of the fly-wheel will cause an explosive charge to be drawn in. This is not exploded, but when the pistons come to rest it remains in some cases for over twenty-four hours, and it is only necessary by means of a separate firing key to fire the right cylinder and the engine is started up.

The Clutch.—In sequence we might pass on from the engine in the Daimler through the clutch to the speed change gear. Different motorists have different methods of keeping the clutch in good order, an occasional dose of castor oil keeps the leather pliable and soft, while a puff of Fuller's earth prevents too much slipping through grease having got on the surfaces.

Change Speed Gears.—From practice I have found it best to completely declutch when going from a low to a high speed, and very often in going from a high to a low, especially when ascending, to slip over the changes without declutching, except with the slightest relief of the clutch by the foot synchronously with a movement of the hand on the levers.

Chains.—Keeping a chain in good order is of considerable importance; a duplicate set of chains is very desirable; and a capital method of keeping them in excellent order if a car is in regular use is to wash the dirt and grease out with paraffin and then boil in Russian tallow. A good method of doing this is to have the chain suspended from a pulley with the lower portion of the chain say a foot or so submerged in a bath of molten tallow; then by carefully rotating the chain allowing time for the tallow to partially run back and set, you get that complete envelopment of the grease which I can from experience say adds considerably to the life and good running of the chain.

Wheels and Tires.—On my new car "Antrona" I had Falconnet compound pneumatic tires. These gave great comfort and resiliency and remarkable freedom from side-slip, there never having been a side-slip on this car. The tires should not now properly be called pneumatics, because I had the air tubes removed from the driving wheels since my run in Scotland last August.

Petroleum Spirit.—I find a good method of keeping the burners in order when flames are used is after putting out the flames to allow the jet of unignited petrol to issue for a few moments, which appears to dissolve and wash out any oily or carbon matter that may have formed, and which would otherwise solidify and obstruct.

Brakes.—A word on the question of brakes. In addition to a spray all cars should be fitted with an absolutely reliable hand brake that will prevent the car running backwards. Messrs. Taylor, of Wandsworth, have recently altered my car, fitting a most satisfactory steel band wood-lagged sprocket brake, doing away with the steel cords which are a great nuisance and apt to stretch, and which on several occasions have given me a good deal of trouble by jamming and not releasing themselves when wanted, and by impeding the progress of the car sometimes when going over a very rough road.

In the discussion which ensued, Mr. Edge, speaking of ignition plugs, endorsed Mr. Edmunds' remarks as to the advantage of the plugs being in course of the exhaust. He deprecated the slipping of the clutch in high-powered cars, and referring to side slips, said the only practice consistent with safety is to drive slowly on greasy surfaces. On the subject of sparking he gave his experience of the insulation of wires, which showed that many wires were insufficiently insulated for motor ignition purposes. As regards the position of plugs, his experiments showed that there was an advantage of 10 per cent. by the plug being on the top of the cylinder instead of at the side. Further, he found that the sparking plug which is right for one cylinder is not right for another. Mr. Edge was in favour of electric ignition and referred to the danger of tube ignition in respect of fire. As regards the inlet valve, his experience was in favour of three small ports instead of one large port, as the former showed less back-firing. The three-port valve was, however, more expensive and had more working parts. Speaking of brakes, he feared the Taylor brake might be disadvantageous on pneumatic tires on account of the difficulty of adjustment and consequent inclination to side-slip.

Mr. Lyons Sampson did not think the Daimler governing was so satisfactory as the Benz governing, as in the latter the compression and mixture were constant. Speaking of compression, he thought probably six atmospheres was the highest which can be properly used in a petrol engine. The possibility of starting after twenty-four hours suggested that the spray carburettor was a wasteful contrivance. He had found that the freezing of circulating water might be prevented by addition of common salt, and that side-slip might be caused by either putting on brake or putting on power, but by releasing power control was obtained sooner. Speaking of induction valves, he said that the American practice is now to use several small ports instead of one large one. The whole secret of valve action was the speed of induction, but there was a limit to the speed of induction. He considered a larger area valve is better than a small area with too high a speed of induction.

Mr. Northey, referring to electric ignition, said on an engine running at higher speeds the De Dion contact breaker was perhaps the best; but the difficulty was to keep the contact points sufficiently clean. Plugs

may arrive at a temperature which may prevent the plug sparking at all. Porcelain of plugs at a high temperature becomes an excellent conductor of electricity. Consequently, at high temperatures, electricity prefers to pass through plugs rather than through the points. He explained that for the purpose of a paraffin engine he had devised a plug in which there is an air space between the porcelain and the outer metal of the plug, the explosive mixture being drawn into the air space and expelled, thus keeping the ring round the sparking point and the sparking point free from carbon.

Mr. Sennett, referring to the slipping of tires, said the petrol carriage was at a disadvantage as compared with a steam carriage on account of vibration. He emphasised this by the illustration of a piece of wood on an inclined plane. The piece of wood may be made to slip if the plane be caused to vibrate. As regards the freezing of the water circulation, he asked if salt would not be apt to set up corrosion. He mentioned that in France some five years ago five *chauffeurs* in comparing notes found that all of them had had their carriages on fire.

Mr. Manville spoke of an arrangement he had adopted to prevent the bursting of an exhaust box by fixing a cock by which the exhaust may be let into the air direct without going into the exhaust box. On cutting off the electric ignition the unignited charges are thus let out into the air without charging the exhaust box. Fouling of plugs by lubricants can be avoided by not turning on lubrication into the cylinder until the car has run two or three miles. He had run his car from last November for 1,000 miles, and had been free from breakdown, and he attributed this to the fact of his not interfering too much with the engine.

Mr. Beevor said the porcelain should not be packed too tight, but a small amount of play should be left. Plenty of platinum should be allowed to project above the porcelain. His experience was that drivers of Daimler cars were always grinding the valves of their cars, whereas on the Benz his experience was that valves should not be ground, and if they are ground the motor does not run so well.

Mr. Shrapnell Smith suggested that a benefit might be derived from an arrangement by which the flame in a tube-ignited car might be retired to the end of the tube and brought nearer in at will. Referring to exhaust silencers, the speaker had been advised to stuff his exhaust box with the empty cartridges of "Sparklets."

Mr. Foster Pedley, speaking of brakes, said that uncompensated brakes were in his experience dangerous. He had examined Mr. Edmunds' Falconet "Compound" tires after 10,000 miles running, and had never seen any tires so satisfactory as regards wear.

Colonel Crompton bore out what had been said by Mr. Edmunds as to the disintegration of rubber tires. Speaking of the lubrication of chains, he said that with the use of a proper lubricant chains have an almost unlimited life. He recommended original suet out of the animal with flaked black-lead. Oil or ordinary tallow and soft lubricants were unsuitable.

Mr. John Allen drew attention to the horn or bracket of the front spring and its weakness where it joins the frame. He also mentioned the tension rod of chains.

PRINCESS FRIEDRICH CARL OF HOHENLOHE is making a journey from Munich to the Riviera in a motor-car.

THE Motor Power Company, of 14, Regent Street, W., have now on view a 6 h.p. Gladiator *tonneau* of the type illustrated in our issue of the 2nd inst.

THE Orleans Railway Co. are now using a motor parcels delivery quadricycle for the transport of papers, etc., between their various offices in Paris.

WE notice that the British Neostyle Co., Ltd., has in use a Roots and Venables parcels express delivery van, while Messrs. Dewars, of whiskey fame, are running a Thornycroft steam-wagon.

A MOTOR-CAR section is being organised by the Italian Automobile Club in connection with an International Exhibition of Sport which is to be held in Milan from the 1st to the 27th May next.

THIS (Saturday) afternoon the members of the Automobile Club will hold a run to Sevenoaks. The start will be made from the Club House at two p.m., and dinner will be taken at the Crown Hotel, Sevenoaks.

MR. A. E. MAJOR, of 29, Broad Street, Reading, who has embarked in the motor trade on an extensive scale, being the district agent for half a dozen builders, is also carrying a stock of petrol and motor-car accessories. He is also well equipped to carry out any necessary repairs.

A GENERAL meeting of the Midland Automobile Club was held in Birmingham last week. It was decided to affiliate with the A.C.G.B.I. The following officers were appointed:—Mr. J. Broughton Dugdale, president; Mr. F. Lanchester, honorary secretary; and Mr. Allan Tangye, honorary treasurer. It is satisfactory to learn that the membership of the new Club already numbers sixty.

A MOTOR FIELD BATTERY.*

BY MAJOR H. A. BETHELL, R.F.A.
(Concluded from page 31.)

Employment of Motors in Savage Countries.—The motor is dependent for its working existence on the supply of fuel—any sort of fuel—and water. These are to be found in any inhabited country. In India or China, for instance, the motor would do well in this respect. But in waterless districts such as are to be met with in South Africa a difficulty would arise, which would have to be met by carrying extra water-tanks. The motor uses about 1 cwt. of water for every 10 miles. In an ordinary civilised country it would carry 2 cwt., or 20 miles supply in its tanks, besides the water in the boiler. For South Africa it would be necessary to add an extra tank holding 5 cwt. of water, or a 70 miles' supply in all; this would reduce the average road speed from 10 to 8½ miles an hour. As when using the low gear in bad ground the consumption of water would be about treble—say 3 cwt. per 10 miles—this allowance of water might be reckoned upon for 40 miles of good and bad going. This is not a very encouraging prospect, but the performance is a good deal more than could be expected of a horse. For very heavy roads in a dry country—luckily a rare combination—it would be necessary to add motor water-tanks to the equipment. A motor tank to keep up with the battery could carry 2½ tons of water; thus each

battery, would be far below that of a motor battery, capable of doing its ten miles an hour for twelve hours running. The superiority of the motor over long distances is so marked that a motor battery, even if restricted to roads and cultivated ground, would in ninety-nine cases out of a hundred be more efficient than a horsed battery.

Motors for Heavy Artillery.—It may be wondered why I have not advocated the employment of motors for drawing heavy guns instead of field guns. There is no doubt a useful field for the motor-car in this direction. The subject is, however, a difficult and complicated one, and, strange as it may appear, the application of motors to field artillery is by far the simpler question of the two. For field artillery the weights to be dealt with are only about double those of our present equipment, and the general dimensions of the carriages remain about the same. But when it comes to pulling a 4·7 gun over cultivation, difficulties of weight of equipment arise. Our leading manufacturers find by experience that even for road work the motor must be twice the weight of the trailer. A motor to pull a 4·7 gun would have to weigh at least 10 tons; if it were lighter the gun would be liable to take charge of the motor on a slope. The 15 ton weight of the gun and motor would be too much for many country bridges,* and very broad wheels would be required to prevent sinking into the ground. I do not mean to say that there is any impossibility about getting a motor to pull a 4·7 gun, but only that the difficulties in the way are of a different kind from those met with in considering the application of motors to field

FIG. 1.—ELEVATION OF STEAM FIELD ARTILLERY MOTOR TO PULL A 15-POUNDER GUN AND TO CARRY 96 ROUNDS OF AMMUNITION AND SIX GUNNERS.

FIG. 2.—FRONT VIEW.

FIG. 3.—PLAN.

additional tank would add 25 miles of good going or 8 miles of bad going to the range of mobility of the battery.

As regards fuel there is less difficulty; thanks to the steam-blast, the boiler will burn anything combustible, from cow-dung to petroleum, and in any inhabited country there need be no difficulty about finding something to burn.

Partial Application of Motors to Artillery Purposes.—Supposing that it were established by experience that the motor, even when built to special "flexible" design, is incapable of moving across country, but that it can be trusted to traverse both good and bad roads, it would still be of great value to field artillery. If the whole of the wagons were drawn by motors, these could carry 200 rounds each. They would be brought up by road as near as possible to the battery in action, and the wagon bodies could then either be limbered up to the gun limbers and brought up to the guns, or the limbers could replenish from them. When marching along the road, the gun horses could be relieved by limbering up the guns behind the motor wagons, leaving the horses to trot away with the empty limber; and the detachments and kits and all impediments could be piled on to the untiring motor. This compromise would greatly improve the marching power of the battery, while leaving its mobility over rough ground unimpaired. But the resulting general mobility of such a composite battery, though superior to that of a horsed

artillery; and I have preferred to deal with what seems to me the easier subject.

Concluding Remarks.—To sum up, we may conclude that the motor-car has no essential disqualification such as to render it impossible from a military point of view. It is cheaper than horse flesh, and far more powerful, enabling heavier guns and a double supply of ammunition to be carried. Up to a certain point, the motor is far more mobile than a horsed vehicle, being able to cover 100 miles a day without difficulty. Over heavy, but not broken ground, such as ploughed fields or standing corn, we may expect the motor to hold its own fairly well with the horsed vehicle. All that remains to be established, to enable the motor to take its place as a military vehicle, is the certainty that it can be made to cross rough ground.

It should be recollected that we are not now considering the possibility of driving a road-car across country, but of constructing a motor vehicle more or less on artillery lines, with 5 foot wheels, and such that no ordinary rough ground shall stop it. To ensure this, the motor must be (1) not liable to upset; (2) not liable to sink in deep ground and, (3) the construction and arrangement of weights must be such as always to give a good bearing for the driving wheels and provide against the contingency of their slipping round without

* From the Proceedings of the Royal Artillery Institution.

* The limit of weight prescribed by Local Boards for vehicles crossing these bridges is in most cases 4 tons.

advancing the vehicle. If this last item can be realised, there is no difficulty in providing power enough to propel the machine across country. Still, in spite of the extra power, no self-propelled wheeled vehicle can ever hope to rival a horsed vehicle at crossing really bad ground, because it is always easier to pull a carriage over obstacles than to push it from behind.

Now, up to the present, no trials of motors across country have been made, nor have any cars been built with a view to military requirements. No one has asked for them, and it is not the business of manufacturers to build experimental vehicles to meet a problematical demand. But several of our leading car-builders are of opinion that there is no very great difficulty in complying with the conditions proposed; and if the War Office were to offer any encouragement—say, an order to six leading manufacturers for a car each, built to Royal Carriage Department design, modified to suit manufacturing specialities—this offer would find a ready response.

The drawings annexed to this paper refer to a design which seems to promise well. It represents a car intended to carry 96 rounds of 15-pr. ammunition and 6 gunners, and to pull a 15-pr. gun. The principal details are:—

Weight of car empty	...	3½ tons.
Weight with 6 gunners, 1 driver, 96 rounds ammunition, 7 kits, 2 cwt. coal, and boiler and water tank filled	...	5.57 tons.
Weight on leading wheels	...	1.15 tons.
Weight on driving wheels	...	4.45 tons.
Diameter of wheels	...	5 feet.
Width of tire, leading wheels	...	4 inches.
Width of tire, driving wheels	...	8 inches.
Track	...	6 foot 6 inches.
Angle of lock	...	44 deg.
Diameter of turning circle	...	35 feet.
Vertical angle through which fore axle can oscillate	...	60 deg.
Wheel-base	...	10 feet.
Length over all	...	19 feet.
Description of engine	...	Thornycroft's compound.
Speed of engine, revolutions per minute on high gear, up to	...	450.
Speed of engine, revolutions per minute, on low gear, up to	...	650.
Diameter of high pressure cylinder	...	4 inches.
Diameter of low pressure cylinder	...	7 inches.
Stroke of pistons	...	5 inches.
Nature of boiler	...	Thornycroft's straight tube.
Boiler pressure	...	180 lbs.
Boiler, how fired	...	From above.
Fuel, description	...	Any.
Fuel consumed per mile, coke, about	...	6½ lbs.
Whether steam condensed	...	No.
Exhaust steam, how disposed of	...	Superheated, up the chimney.
Motion how conveyed to driving axle	...	Double helical gearing.
Driving wheels, how connected	...	Jack-in-the-box gear.
Driving power, where applied	...	To rims of wheels.
Driving power, how applied	...	Thornycroft's driving springs.
Steering gear	...	Chains to fore axle.
Speed on level road, miles per hour average	...	10.
Speed extreme on level road, miles per hour	...	12.
Height of centre gravity, without gunners, about	...	5 feet.
Upsetting angle, without gunners, about	...	33 deg.

MR. MARK MAYHEW has arrived at Nice with his 16 h.p. Napier. He was accompanied by Mr. Russell, who rode with him from London to Southampton and from Havre to Nice, *via* Paris, Bordeaux, and Marseilles.

THERE was quite a humorous touch about the menu card of the inaugural banquet of the Lincolnshire Automobile Club on Saturday last. Each of the items was given an automobile connection, Hors d'Œuvres being classed at starters, Sweetbread à la Française as inlet valves, Lobster Patties as clutch levers, Roast Lamb and Mint Sauce as explosive mixture, Champagne Jelly as thick lubricant, Blanc Mange as tremblers, Stewed Fruit as belt tighteners, Custards as exhausts, and Dessert as silencers!

A MEETING of the members of the Motor-Vehicle Users' Defence Association is to be held at the Automobile Club on the 29th inst., when the following resolutions will be proposed:—(1) That the Motor-Vehicle Users' Defence Association hereby agrees to be merged in the Motor Union about to be formed, and that the Trustees be and are hereby authorised to direct that the funds of the Association be handed over to the Motor Union; (2) that the Secretary be authorised, with the consent of the Trustees, to cancel the trust deed; (3) that the Committee and Secretary be, and they are hereby authorised and directed to hand over such funds as may be in their hands to the said Motor Union; (4) that all necessary steps be taken to wind up the affairs of the Motor-Vehicle Users' Defence Association.

FURIOUS DRIVING CASES.

ARTHUR E. GEORGE was at the Newcastle Police Court last week fined 8s. and costs for the furious driving of a motor-tricycle along Blackett Street. The evidence of P.C. Johnstone was to the effect that George was driving the tricycle at the rate of eighteen miles an hour, and he added that the machine "jumped" two feet in the air at the crossings. The defendant denied that he was driving at such a pace. He said that owing to the high speed of the engine, and the consequent noise of the exhaust, the tricycle appeared to be going much faster than was actually the case.

AT the Derby County Police Court last week, Archibald Hedge, in the service of the Earl of Harrington, was summoned for furiously driving a motor-car on the highway at Elvaeton on the 20th February. Mr. J. Bostock, defended Hedge, who denied the offence. P.C. Burchley said the defendant was travelling at 20 miles an hour, and this was corroborated by two witnesses. For the defence it was stated that the defendant was away from Elvaeton Castle three-quarters of an hour, and in that time travelled only 7½ miles, so that he could not have been going more than 12 miles an hour. A fine of 5s. and costs, however, was inflicted.

THE OLD, OLD STORY.

Hobby, pace; Bobby! race.
Caught! summons; Court: rum 'uns.
Firth speaks; Mirth, Beaks.
Vain aid; Fine: paid.

—R. W. B.

DRIVING TO THE COMMON DANGER.

HERBERT GYNES, in the service of Messrs. Diespeker, 59-60, Holborn Viaduct, appeared to a summons for wantonly driving a light locomotive to the common danger. Police-constable Billing deposed that he was going at a very rapid pace. He turned into Snow Hill without any warning to other drivers, and without slackening. Several men had to pull their horses upon their haunches in order to avoid colliding with him. He then "swung" over to the near side, colliding with a vehicle. The carman in question having given evidence, the defendant protested that he was not going at more than three and a-half miles per hour. He had been the instructor to the Bournemouth Corporation, and was very careful. With reference to the accident, it was caused through the horse slipping. The Alderman: There was evidently a great want of care on your part. You must pay 20s. and costs.

A DISPUTED PURCHASE OF A MOTOR-CAR.

SHERIFF LEA has issued judgment in an action raised in Forfar Sheriff Court, in which James MacFarlane, cycle and motor-car dealer, Perth, sued Alexander Ross French, dentist, Forfar, for £135, being the price of a motor-car said to have been purchased by defender from pursuer in July last. Defender conducted his own proof, and the case occupied the Court for four days. The Sheriff finds that, after several exhaustive trials, the defender purchased the car from pursuer and took delivery thereof; that the defender has never rejected the car, but still retains possession, and refuses to pay for it; therefore deems for the purchase price and finds defender liable in the whole expenses of process. In a note dealing with the case his Lordship says that by a long and tedious proof conducted by himself with a pertinacious disregard of all relevancy and proportion, the defender had made it quite clear that in this case there was no room for the plea of rejection. Indeed, the defender spared no pains to show that before he took delivery of the car he had seen it at its worst and discovered every fault which he now alleged against it.

REFUSING TO STOP.

AT Kingston last week, William Watts was summoned for neglecting to stop a light locomotive of which he was the driver on a person having charge of a restive horse putting up his hand as a signal for that purpose. Mr. Peter Grain, barrister, appeared for the defence.

Samuel Streaight, a coachman, of Avenue Elmers, Surbiton, deposed that on February 28 he was driving a pair of horses in the Avenue Elmers, when he saw a motor-van approaching, and he raised his hand as a signal for the driver to stop. The driver (defendant), however, continued to come on, and did not stop until he had passed witness. Consequently witness's horses commenced to plunge, and one of the animals fell upon the footpath. Witness asked defendant why he did not stop sooner, and he replied by swearing at witness, and when his name and address was demanded he refused to give it. He (witness) therefore called upon a gentleman to procure the defendant's name and address, and he succeeded in doing so.

Mr. Cockburn, Chairman of the Bench, then entered the witness box, and stated that while, on the 28th ult., he was standing at the front door of his residence in Avenue Elmers, he observed a motor furniture van standing in the road. Complainant came out of some stables at the top of the Elmers steadily driving a pair of horses attached to a victoria. At the same time witness heard the sound of a whistle or hooter, and noticed another motor-van, driven by the defendant, coming up the Elmers. When he got up to the stationary motor-van defendant,

instead of pulling up as he ought to have done, pulled wide out to the right and back again to the left, close upon complainant's horses. The animals plunged, and one fell, and had it not been for the promptness with which the groom sprang from the box, or had the driver lost his head; he (Mr. Cockburn) would have witnessed the worst accident he had ever seen.

By Mr. Grain: Witness was not aware that the roads were very heavy. Defendant was not travelling at an excessive pace. It might have been four miles an hour. There was room enough for three vehicles to pass in the road at the same time. The stationary motor van was on the left of the road, complainant was on the right, and the motor which defendant was driving, which belonged to Messrs. Spiers and Pond, was coming up the centre of the roadway. The defendant elected to give evidence on oath, and stated that he was the driver of Messrs. Spiers and Pond's motor van, which made the journey from London to the Southampton Hotel, Surbiton, daily. He first saw complainant when he was thirty yards off, but he did not observe him hold up his hand, or he would have stopped, as he always did. When he saw the horses reative he pulled up, and stopped by the side of the stationary van.

For the defence Mr. Grain submitted that defendant did not see the coachman put up his hand or wave his whip.

Mr. Innes, who had temporarily taken the chair, said that the magistrates considered defendant in fault, and he would have to pay a fine of £5.

Mr. Grain said that in view of the case in all probability going to a higher court, he would like to know on what grounds the magistrates declared their verdict.

Mr. Innes replied that it was on the grounds that the coachman gave the signal for defendant to stop, and that defendant saw the signal.

ACTION BY THE DAIMLER MOTOR COMPANY.

ON Friday last week, in the Chancery Division of the High Court, before Mr. Justice Buckley, Mr. Buckmaster applied in the case of the Daimler Motor Company v. British Motor Traction Company, which was an action for an injunction to restrain the defendants from registering any company under the name of the Daimler Wagon Company, or any other name likely to deceive the public, that the motion should stand till the trial, and that the hearing should be expedited. Counsel said that the plaintiffs based their case on the probability of misconception by the public that the defendants' motor-cars were the plaintiffs'. There was a conflict of evidence, and he suggested that the defendants should undertake not to proceed with the registration until the motion could be disposed of finally. Mr. Aston Cross, for the plaintiffs, said he was willing to give the undertaking not to proceed with the registration until after Easter, on the understanding that the motion should be heard immediately after the vacation. His Lordship sanctioned the arrangement, and directed the motion to be set down at once for that purpose.

TRACTION-ENGINE OR LIGHT LOCOMOTIVE?

AT the Chelmsford County Sessions, last week, Daniel Cornish, brick manufacturer, Hutton, was summoned for using a locomotive on the highway, not being licensed by the county council, at Ingatestone, on February 13th. Mr. F. P. Sutherly prosecuted, and Mr. E. J. Naldrett was for the defence. At the last Court Sergeant W. Cowell deposed that the locomotive was in use upon the road, that it had no licence, and he alleged that it emitted visible vapour.

Mr. Naldrett contended that the Act of 1898 had no application whatever to this locomotive, and that the locomotive complied with all the requirements of a light locomotive: it could travel backwards and forwards, it did not exceed six feet in width, it more than complied with the requirements as to the width of wheels, and the emission of steam was not continuous, but only temporary or accidental. It had been successfully designed and constructed to come within the meaning of a light locomotive, and the Clerk of the Council had come to the conclusion that a licence was not required. Mr. J. H. Mann, managing director of Mann's Patent Steam Car Company, stated that his firm turned out about one of these locomotives every week, and there were between forty and fifty now in use in various parts of the kingdom, which were all working without licences. They had been so constructed as to come within the Light Locomotives Act, 1896. George Taylor, engineer, Chelmsford, said he had seen steam issuing continuously from the funnel. In his opinion, it was impossible for an engine of this character to work without some amount of steam and smoke being emitted. He should describe it as a miniature traction engine. The Bench came to the conclusion that this was a locomotive which ought to be licensed, and the defendant was fined 5s. and costs. It was intimated that there would be an appeal.

DAMAGES FOR PERSONAL INJURIES.

AT the Leicester County Court, on Tuesday, the case of King v. the Leicester Motor-Car Company came on for hearing. Mr. Bray appeared for the plaintiff and Mr. Harding for the defendant company. The plaintiff, a commercial traveller, of Leicester, sued the company for £4 13s., damages for personal injuries sustained while on a motor-car in Humberstone Gate. Plaintiff said that on October 8th last he got on the front of a motor-car in Humberstone Gate. He took a half-crown

from his pocket to pay his fare, when the car suddenly stopped. The driver got down and opened the side of the motor, and started the engine, when the handle suddenly swung round and struck him a violent blow on the hand. He had to lay up for a week, because the doctor bound his hand up so that he was unable to work. Percy Willett corroborated. Mr. Harding, for the defence, said it was physically impossible for the accident to happen. He called Thomas Menzies, who said the car was stationary while he was attending to the motor. The steering handle was straight, and could not have moved unless the car moved very suddenly to the right or left. The handle would not turn suddenly unless the car was going very fast and the front wheel struck a stone. Mr. Cann, of the Leicester Motor-Car Company, gave similar evidence. His Honour said this was a case where an ounce of fact was worth a pound of theory. He could not accept evidence as to what ought or ought not to have happened, against the definite statement of the plaintiff and the witness Willett. He found for the plaintiff for £3.

THE Belgian Automobile Club is organising a kilometre race to be run off on 19th May next.

MR. G. F. TAYLOR, High Street, North Finchley, is stocking petrol and motor accessories. He is also able to undertake repairs.

THE South-Western Motor Company started running their motor-omnibuses between Streatham and Clapham Junction on Monday last.

AT Newmarket, on Tuesday, Dan Maher, the American jockey, was ordered to pay a fine of 10s. and 11s. 6d. costs, for driving a motor-car on a footpath near Newmarket.

WE learn that the Eadie Manufacturing Company, Redditch, are laying themselves out specially to produce motor parts and fittings for the trade on a large scale.

ARRANGEMENTS are being made at the works of the Ward-Leonard Electrical Company, at Brouxville, N.Y., to manufacture light cars on the Darracq and Renault systems for the American market.

MR. C. T. CROWDEN, of Leamington, has recently completed the work of converting from a horse-drawn fire engine into a motor-vehicle. The car has lately been subjected to a series of trials in the Worcester district with satisfactory results.

A TELEGRAM from Capetown states that a motor Maxim gun, invented by an officer of the Capetown Guard, has been officially inspected and approved for service. The invention consists of a Maxim gun mounted on a motor-car.

OUR readers will be interested in learning that arrangements have been completed for the manufacture of the Serpollet steam car in this country, and that twenty-five of them are now in course of manufacture. The first cars are expected to be delivered the latter end of May.

MR. W. H. KINSBURY, 61, Bath Street, Glasgow, has been appointed sole agent for Scotland for Messrs. De Dion-Bouton. It is stated that Mr. Kingsbury will be the representative of a small syndicate in the course of formation under the title of De Dion-Bouton, Scotland.

THE motor-car driven by Dr. Frost, of Bournemouth, overturned in the Cranborne Road on Saturday afternoon owing to some derangement of the machinery. Dr. Frost and the attendant were thrown out, and Dr. Frost sustained severe bruises and a cut face. The attendant escaped uninjured.

ACCUMULATOR INDUSTRIES, Limited, are, we learn, making a speciality of special charging sets of "Cupron" cells, i.e., two boxes, each containing four cells, giving 600 ampere hours at three to four volts per box, which is ample to charge any electric ignition cells for motorists. It is claimed that the positive plate does not wear out, and that after giving 600 ampere hours will regenerate in the air. The zinc plates last three discharges, so that 1,800 ampere hours can be got without any renewals except electrolyte, only the zinc plates then requiring to be renewed. The company inform us that their factory at Woking is now completed and that they are executing orders for stationary and traction batteries for electric cars and launches. They are prepared to charge electric vehicles at 3d. per unit at their works, which are off the Maybury Road, Woking, very handy for cars running on the Ripley Road.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

THE Motor-Car Journal.

LONDON, SATURDAY, MARCH 30, 1901.

[No. 108.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SATURDAY afternoon was cold but fine, and a considerable number of sightseers and cars were assembled outside the clubhouse of the Automobile Club at the start of the run to Sevenoaks. Amongst those lined up were Mr. Instone, on the M. M. Co.'s new light 6 h.p. car; Mr. and Mrs. Edge on a Gladiator, with two dogs as companions; Mr. W. Bersey on a 12 h.p.

racing Darracq, having as passenger Mr. Maurice Egerton; Mr. and Mrs. T. B. Browne on their 6 h.p. Panhard; Messrs. Johnson and Bruce on a 6 h.p. Darracq; Messrs. Peall and son on a 6 h.p. Daimler; Mr. R. E. Phillips on his Mors Petit Duc; Mr. Burgess on a new 12 h.p. M.M.C. Panhard; Mr. E. Townsend and party on a 6 h.p. Darracq; Mr. Moore on a Delahaye voiturette; three Locomobile cars, including that of the Hon. C. S. Rolls; Mr. Ritchie and party on a Richard car; Mr. and Mrs. Fuller on a new De Dion voiturette; Mr. Harvey du Cros, jun., and friends on a 9 h.p. Napier; Mr. Cecil Edge and friends on a De Dion voiturette; Mr. Lionel Johnson on a 8 h.p. Benz, etc. The run down to Sevenoaks was very successful, the roads being in excellent condition. About twenty-seven members and their friends took dinner at the Crown Hotel, Sevenoaks. Some remained over Saturday night, but the majority drove home after dinner. Great interest centred around Mr. Maurice Egerton's 12 h.p. Darracq car, as this was the car on which Mr. Harry Farman in the Pau race covered 140 kilometres in 140½ minutes, or an average speed of thirty-seven miles an hour. A peculiar accident befell Mr. Townsend's Darracq while standing in the yard at Sevenoaks. The starting handle had been left under the driving seat in such a position as to "short circuit" the accumulators, with the result that the celluloid covering of the accumulators caught fire. The fire was, however, extinguished without much damage resulting.

The Wolverhampton Automobile Club.

THE first run of the recently-formed Wolverhampton and District Automobile Club was held on Saturday last. The meet took place at 3 p.m., at the Bath Road entrance to the West Park. The following cars turned out: 6 h.p. Siamese phaeton, driven by Mr. J. Lisle; 6 h.p. Endurance, driven by Mr. A. E. Jenks; 6 h.p. voiturette, driven by Mr. G. Prew; 4½ h.p. De Dion, driven by Mr. T. Young; 4½ h.p. Star, driven by Mr. E. Lisle; 4 h.p. Sunbeam, driven by Mr. Cureton; 4 h.p. Mayfair, driven by Mr. S. R. Rhodes; 3½ h.p. Benz, driven by Mr. J. W. E. Stirk; 3½ h.p. Star, driven by Mr. E. Lisle, jun.; a Locomobile, driven by Mr. F. Platt; and a 2½ h.p. De Dion quad, driven by Mr. H. W. Jenks. At twelve minutes past three a start was made, and though some slight misunderstanding as to direction rather split up the party, the run was very successful. The village of Albrighton was reached by the first car at 3.44 p.m. and here a halt was called for the others to come up. Seven cars

soon arrived, and after waiting some time for the others, but without result, a restart was made for the Jerningham Arms, Shifnal, where tea was taken. Five cars of the party left for home at ten minutes to seven, the rest about an hour later, the homeward journey being taken through Gailey.

From Frankfort to Cannes.

MR. BALLIN HINDE, a member of the Automobile Club, reached Cannes at 3.30 p.m. on Wednesday, from Frankfort-on-Main, via Switzerland and the Basses Alpes, a distance of 708 miles, which he covered in 44½ hours in a German-built 12 h.p. motor-car. The weather throughout the journey was terrible, and in many places the car rode axle deep in snow, especially over the mountain summits. Mr. Hinde received the hearty congratulations of the many motorists who are assembled at Cannes.

Motor-'Bus Services in Staffordshire.

AT a meeting of the Potteries Electric Traction Company, Ltd., held in London last week, it was stated that the directors had decided to establish an experimental service of steam omnibuses in connection with their tramways in the Potteries district in order to provide traffic facilities for the outlying villages, and that two of these conveyances will shortly be run between Burslem and Milton, Staffordshire.

Maidenhead Bridge Tolls.

MR. JOSEPH TAYLOR, a member of the Eton Urban District Council is commencing an agitation against the tolls levied on Maidenhead Bridge, which connects Berks and Bucks, and is on the main road to Bath. Mr. Taylor contends that the bridge should be taken over and maintained as a county bridge by the Berks and Bucks County Councils. Mr. Taylor, who, two years ago, was successful in an action against the Windsor Corporation, and freed the bridge leading from Windsor to Eton, will undoubtedly have the sympathy of all motorists in his agitation.

English Motorists Racing on the Continent.

THE events at Nice this week have been followed with more than usual interest owing to the fact that two English motorists, Mr. Mayhew and Mr. Hutton, had entered for one of the events. Then, too, in the Gordon-Bennett race we are to be represented, while we now learn that Mr. Harvey du Cros will shortly be receiving delivery of a racing Panhard of this year's pattern which he is entering for all the big French races. Unfortunately particulars in regard to the horse-power, etc., cannot be published at present, as the type is similar to that which will be driven in the Gordon-Bennett race, but we understand, however, that a great advance has been made on last year's pattern. As the car will be driven by Mr. Chas. Jarrott in the various races on the Continent this season, the matter is of interest, as we do not think that any Englishman has before had the opportunity of competing against French *chauffeurs* on an identical car.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

Brakes Again.

THE outcome of the deliberations of the Technical Committee of the Automobile Club on the subject of brakes appears in the statement that special attention will be paid to this point in the forthcoming Glasgow trials, and observations on the effective backward brake power will be included. It by no means follows that a brake capable of holding a car stationary on an up-grade will stop it in the event of rearward motion having begun; while other devices such as sprags are of course still more incapable of this. Few cars now are deficient in forward brake power, at least when in good order; but the point that requires emphasis is the necessity for keeping them so. A leather brake-band, even if of dimensions sufficient to avoid firing

TOURING IN ALGERIA—INTERESTED SPECTATORS AT BOGHARI.
Cliche de) (La France Automobile.

under ordinary conditions, soon becomes coated with a metallic surface which greatly diminishes its adhesion; and the occasional removal of this with a coarse file, and the application of castor-oil in small quantity, is about the best method of preserving its efficiency, while wood-lined bands are best treated with resin. Emergency brakes should really find their best position at the circumference of the driving wheels, but the exigencies of pneumatics usually require the substitution of a brake drum. It is somewhat surprising that the possibilities of the rim brake do not seem to have met with much consideration for automobiles.

TOURING IN ALGERIA.—OUT IN THE DESERT.

Motor Touring in Algeria.

FOR the past two months Messrs. Joseph and Pierre de Crawhez and M. E. Dauw, three well-known Belgian automobilists, and a party of friends, have been touring in Algeria. Messrs. Crawhez each drove 12 h.p. Panhards and M. Dauw a 6 h.p. Belgian Daimler. Intelligence has this week

reached us from Algiers of the successful conclusion of the expedition, the first ever attempted, across an African desert. The route followed was due south of Algiers to Gardhaia, via Laghouat, a distance of over 400 miles. The last 280 miles were covered across country, or on camel paths, no roads being in existence. We are able to reproduce a couple of interesting photographs taken during the tour.

The Position of the Coachbuilder.

THE question as to whether the automobile trade should fall into the hands of the carriage builder or the cycle maker is one that has at various times attracted attention, and the organs of the former have with praiseworthy enterprise endeavoured to rouse their readers to a sense of the importance of the business, which they feel should descend by a sort of hereditary right into their hands. As a rule, however, the cycle dealer has been more ready to seize opportunities, though a few notable exceptions will occur to everyone, and it is worth while considering how far the coachbuilder is qualified to compete with him. In one or two cases, the latter, being a man of capital and influence, has gone to the extent of establishing complete works for the construction of motor-vehicles; but as a rule he can only expect to supply the coach work for *chassis* already made, and even here a more or less profound modification of his preconceived ideas is necessary. It is not an uncommon thing in France to see a frame on which all the resources of the engineer have been spent to secure lightness ruined by the excessive weight in the body, and though paint and upholstery remain the same, carpenters and blacksmiths must be superseded by engineers and fitters before a modern light body with aluminium framing and panels can be constructed. There remains yet a third method of producing an automobile, more particularly the lighter types, namely—building it up from a purchased motor and components, a method which is likely to become widely adopted: and this involves work foreign to the carriage builder, though to some extent *ejusdem generis* with cycle construction. In short, he must be prepared for a radical change from the time-honoured methods usual to his business before he can take his share successfully in automobile work.

A Comfortable Inn.

A MEMBER of the English Motor Club tells us that when stranded in Kent recently with a "fired" engine, he found the "Kentish Yeoman," at Seal, three miles from Sevenoaks, on the Igham road, a veritable harbour of refuge. Although quite an inn, and with no pretensions to being a "flash" hotel, the "Kentish Yeoman" is clean, comfortable and cheap, cooking good, and claret in condition. What is more to the point, from an automobile point of view, is that the house owns a good lock-up and concreted shed, and a water supply per hose.

The New Mors Racing Car.

M. GEORGES PRADE, in the *Auto-Vélo* of the 21st inst., describes the new Mors car which is to be driven by M. Levegh in the Gordon-Bennett race. He says that although the car is described as a 28 h.p., it appears to him from the appearance of the bonnet that this description is similar to that often given by ladies concerning their ages. The carriage has four vertical cylinders, with ignition by revolving magneto. In appearance the carriage is like former Mors cars only that it is lower than ever. The vehicle has four speeds. The second speed, at 700 revolutions per minute, is calculated to give 28 miles per hour. The motor with ignition fully advanced makes 1,100 revolutions per minute. At this speed of motor the second speed would give about 44 miles per hour. The fourth speed at 700 revolutions per minute should give 66.2 miles per hour, and at 1,100 revolutions per minute 93 miles per hour. Presumably these are theoretical calculations. M. Prade states that the vehicles should not weigh more than 1 ton 2 cwt.

Another Trans-Continental Run.

ARRANGEMENTS are being made for an automobile trip from San Francisco to New York, to be run as a record for time by Mr. Alexander Winton. The trip has been planned by the Cleveland *Plain Dealer*, whose correspondent accompanies Mr. Winton on the journey. The trip will be commenced on the first day of May. Mr. Winton will carry military documents from the Department in San Francisco to the Department in New York. The probable route will be through California, Nevada, Colorado and Kansas to the east. Let us hope the run will be more successful than the one attempted by Mr. Davies a year or two ago.

Criminal Negligence?

THE ways of horse-owners are—sometimes—peculiar, but it is seldom, we hope, that they are so foolish as one of whom a certain member of the A.C.G.B., residing in a southern county town, recently told us. The noble animal he owned had shown its objection to our informant's car in the usual way, having bolted down a steep hill with a cart, and considerably damaged the same, whereupon the automobilist, anxious to conciliate prejudice, called on the owner and offered the use of his car for the purpose of training the refractory steed, adding that, though, of course, denying liability (he was stationary some distance off when the accident occurred), he would pay part of the damage if his offer was taken advantage of. The owner made some excuse about its taking too much time, and said he meant to sell the horse, and though the other remonstrated with him for not attempting to cure its vice, and called several times to renew his offer, he was met by excuses; though a few days ago the owner had the coolness to send him an account for the damage, which, needless to say, was not paid. Enlightened owners of horses have often complained to us of the difficulty of finding opportunities for such training, and like most other motor owners we have done our best to assist them; but where such opportunities are deliberately neglected it should be held sufficient evidence of negligence in the event of subsequent accidents.

Minera Pulveris.

It seems rather unseasonable to mention dust as one of the banes of the automobilist, considering its proverbial value at this time; but it is a more insidious enemy than mud, and the cause of its special obnoxiousness to motor-vehicles does not seem to have been fully considered, the general idea being that it is thrown up by the wheels, high speed being the principal cause thereof. This is only partially true, as a much larger proportion is stirred up by such parts of a car's mechanism as are carried near the ground, *e.g.*, radiators, silencers, etc., and by ill-directed exhaust pipes, while the leather flaps often attached to front mudguards are great offenders, acting as fans for the purpose. Once raised, it is drawn into the partial vacuum immediately behind the car, and deposited plentifully on the backs of the passengers. It is noticeable how comparatively free from the dust plague an electric vehicle is, and this is probably not due so much to its high build as to the freedom from obstruction to the air passing underneath the car. The advantages of low build cannot be sacrificed in the interests of cleanliness; but a design embodying a level under surface next the road would do much to diminish the pillar of cloud with which summer travelling is usually accompanied.

Progress in the Provinces.

It is not only in London, but in the provinces also, that automobilism is on the increase, and although the spread of the cult of the motor-car in the country is not so rapid, perhaps, as in the metropolis, yet very material progress is being made. In Yorkshire, the Bradford Motor-Car Company, which has been established about eighteen months, has opened up a new depot in what was known as the Bellevue Skating Rink. The freehold of this large building has been purchased, and Mr. House

(the manager) and Mr. E. Pye (the treasurer) are stocking this fine depôt with all the latest pattern cars and voituresses. They intend keeping, and have already cars which are let out on hire; they are fitting up repairing shops, and propose buying and selling new and second-hand cars. Such enterprise deserves success, and we wish our friends the reward of their pluck.

Electioneering on Motor-Cars.

MR. A. HOUSE, manager of the above company, recently paid us a visit, and in the course of conversation alluded to the great part played by motor-cars in the recent elections. He claims to have been one of the first to use a motor-car for electioneering purposes in Great Britain, and stated that he used a car in 1895 for the purpose, having obtained the permission of the police authorities. Mr. House is secretary to the Bradford Cycle and Motor Car Trades Association, and is arranging a special dining train to bring to the forthcoming Exhibition the members of this Association. He hopes that at least one hundred will take advantage of his organisation.

Herne Bay's Decision.

At the last meeting of the Herne District Council, held at Herne Bay, the clerk reported, in reference to an application for a licence for a motor-car to ply for hire, that the Council had the power to issue such licences. Councillor Iggulden considered the Council should act on the same principle with motor-cars as they did with hackney carriages, etc., and that was to issue no licences except to residents in the town.

A NEW USE FOR RACE-COURSES—THE HORSES DISGUSTED.

He, therefore, suggested that the application before them be refused unless their conditions were complied with. This resolution was adopted.

The White Steam Car.

A NEW steam-car of American manufacture has just been introduced into this country by Mr. George Sawyer, of 9, Eastlake Road, Camberwell, and will be on view at the forthcoming Exhibition. The new vehicle, which is known as the White, is made by the White Sewing Machine Company, of Cleveland, U.S.A., and comprises several novel features. Steam is supplied by a generator consisting of helical coils of seamless tubing placed one above another, surrounded by a casing of insulating material. Heat from a burner consuming petrol is applied at the underside of the coils, and the water is passed into the coils by means of a pump, the supply being entirely controlled thereby. The water enters the generator at the top, and is always in the upper part of the coils, the steam generated being in the lower coils, emerging from the coil next to the fire. The makers claim that the generator is therefore absolutely non-explosible, impossible to burn out, and all without fusible plugs or other mechanical contrivances. The water supply is controllable by the steam pressure, and super-heated steam being used the exhaust even in damp weather is but slightly visible. A double-acting two-cylinder engine fitted with a simple link reversing gear is used to drive the car. We hope to publish full particulars of the vehicle at a later date.

Demonstrations in America.

THE Automobile Club of America has been taking a leaf out of the book of the A.C.G.B.I., for, in connection with the Bills which have been brought forward to restrict the speed of motor-cars, they invited the U.S. Assembly Committee on Internal Affairs to a practical demonstration, in which five cars propelled by all kinds of motive power took part. These vehicles were run up and down on the State street side of the Capitol in Washington, and to show how susceptible they are to regulation a twelve-year old boy acted as driver of one of them. The demonstration, which was satisfactory to the Committee, was unique, for the reason that an exhibition of this character had never been given before a committee of the Legislature. Mr. Albert R. Shattuck, president of the A.C.A. was the principal speaker at the hearing which preceded the demonstration. He did not object to the enactment of a law which would govern the speed of automobiles, but he was opposed to vesting the rights to frame ordinances in boards of supervisors. He pointed out the fact that supervisors in various localities might enact such ordinances as would be confusing to automobilists. He suggested that the bills be dropped and a general law substituted for them which would permit automobiles to run at the rate of eight miles an hour through villages and of fifteen miles an hour through country districts. He further suggested that the existing law which requires a vehicle propelled by steam to be preceded by a man on horseback be amended so as not to apply to automobiles. Mr. Shattuck's suggestions were favourably considered by the Committee.

Motor-Car Services in Orkney and Shetland.

ORKNEY and Shetland, which are both guiltless of railways, are apparently quite alive to the advantages of the value of the motor-car for the purpose of rapid communication, a company being in course of formation to start a service. So far as Orkney is concerned, it is proposed, at the outset, to run a motor from Kirkwall to Stromness, a distance of about fourteen miles. At present the only regular communication is by coach. It is also intended to utilise motor-cars for the conveyance of agricultural and other produce to Kirkwall and Stromness for shipment. In the case of Shetland, the idea is to run a motor from Lerwick to Scalloway. The first motor-car arrived at Stromness last week, and a trial run was made to Kirkwall, where it created quite a sensation. The promoters state they will be able, even with the necessary stoppages for taking on and putting down passengers, to accomplish the journey to Stromness in a little over an hour, and at half the fares at present charged for the trip. As there is a heavy tourist traffic between Kirkwall and Stromness during the season, the proposed service should prove successful.

The Irish Automobile Tour.

The programme of the tour to be held in Ireland next August by the Automobile Club has now been drawn up. It runs thus:—Aug. 12, Dublin to Waterford; Aug. 13, Waterford to Cork; Aug. 14, Cork to Glengarriff; Aug. 15, Glengarriff to Waterville; Aug. 16, Waterville to Killarney; Aug. 17 and 18, Killarney; Aug. 19, Killarney to Lahinch; Aug. 20, Lahinch to Recess; Aug. 21, Connemara (local runs); Aug. 22, Recess to Mallarannee and Achill; Aug. 23, Mallarannee to Enniskillen. The tour is most comprehensive. Kerry especially is favoured; and over the good, if narrow, roads of this county motorists will enjoy many lovely views. Connemara will appeal more to the heart of the motorist. There the roads are comparatively level, and long stretches of clear highway, without hills or awkward corners, will be welcome after some of the tortuous routes met in other districts. On August 24 the party will break up at Enniskillen, one portion going to Belfast and crossing to the Glasgow Exhibition, while the other section will make for Dublin. Great interest in the event is already being shown in Ireland,

and no doubt exists as to the welcome which the tourists will get all over the country.

Continental Military Authorities and Motor-Cars.

THE Austrian military authorities, after experimenting for two years on the value of automobiles for conveying stores and ammunition, now intend to test the possibilities of transporting troops by this method. Special automobiles capable of travelling over uneven ground safely, and ramming fences or other obstacles to a cross-country journey, are being constructed by an Austrian firm, and will be tried at this year's manoeuvres, which will take place in South Hungary in September. They will be on a large scale, over 100,000 troops being engaged in them. The announcement is also made in the *Velo* that the French artillery authorities at Vincennes have issued a notice to all owners of motor-cars and motor-cycles to send in information of their machines, with a view to handing them over to the State in case of the mobilisation of the army. Covered and closed carriages will be preferred, and the amount to be paid by the State will be fixed by the artillery staff, the price depending on the condition of the vehicle at the time of sale. The artillery will only be able to call up the automobiles in case of mobilisation; if the vehicle is bought its owner may be attached as driver to the staff to which his car is assigned.

The Reading Show.

THE Reading Automobile Club duly opened their exhibition at the Corn Exchange on Tuesday last. Arrangements had been so far perfected that, unlike most exhibitions, everything was in readiness for the opening. The chief work has fallen on the shoulders of Dr. Truman, who has been indefatigable in his exertions for the comfort and attention of both the public and the exhibitors. The exhibition has proved a great success, and the Club is to be heartily congratulated upon having got together such a representative display of cars. Altogether twenty-three vehicles are on view, and, in addition, several motor-cycles. The first exhibit to attract attention is that of Messrs. Dennis Brothers, of Guildford, who show a motor-tricycle and a quad—the latter fitted with clutch, water-cooled head, and small radiator. The major portion of the well fitted and warmly-heated hall was occupied by the Speedwell Motor Company, of Reading. They had on view twelve cars, including specimens of the Renault, Darracq, Decauville, Argyle, Mors, and other types; also a Serpollet steam lorry, ordered by a local firm, to carry one ton at an average speed of twelve miles an hour. Other exhibitors include Messrs. Baker and Co., Darracq, Decauville, and Singer motor-tricycle; the Humber Cycle Depot, Daimler wagonette; Messrs. Vincent and Co., carriages; and Messrs. Pugh and Stroud, two of the latest pattern 6 h.p. mail and Panhard phaetons. Although the attendance has not been a large one, very good business has been done, the exhibitors declaring themselves well satisfied.

Motoring in the Alps.

THE motor-car is proving its ability as a hill climber. One of the most notable journeys demonstrating this was that of Lieutenant Engler, who has crossed the Alps twice with three passengers and 200 lbs. of luggage in his car. Starting from Frankfort-on-the-Main, he crossed the Danube at Ulm, struck the valley of the Isar at Munich, followed up the valley to the Karwendel Mountains, which he crossed at an elevation of about 4,000 feet, travelled south-east among the mountains into the Tyrol, rode on into the heart of the Austrian Alps, crossing the Brenner Pass at an elevation of about 5,000 feet, and finally descended into the plains of Lombardy and on to Venice. When he returned north through the mountains he travelled a little over 1,200 miles in 99 hours. His conveyance was the first to ascend some of the steepest slopes on which roads have been built in the Alps.

THE NICE WEEK.

THE automobile fêtes at Nice began on Sunday last with a battle of flowers on the Promenade des Anglais. All the leading *chauffeurs* were present, and the sight was very pretty and animated. Most of the automobiles were beautifully decorated. The Prix d'Honneur for the best decorated cars were awarded to:—M. Just Fernandez, Prince d'Essling, Baronne de Zuylen, and M. Garibaldi. The event of the week has, however, been the two races on Monday for racing and touring cars respectively. The first was over the Nice-Aix-Senas-Salons-Aix-Nice route, the distance being 460 kilomètres, and brought out some veritable monsters. It was open for (A.) motor-cycles and voiturettes, (B.) cars weighing between 250 and 400 kilos., and (C.) cars weighing over 400 kilos. The starters were as follows:—

Class A.—Gasté, Beconnais, Gleizes, Bardin, Osmont, and Demester, all on motor-tricycles.

In Class B. the starters were: Paul Baras, Marcellin, H. Farman, Edmond, and Boyer.

The competitors in the giant section (Class C.), who started were: Lemaitre, Loraine-Barrow, Werner, Stead, P. Marge,

mètres), comprised five classes:—(a) Motor-cycles and voiturettes; (b) two-seated cars weighing between 250 and 400 kilogrammes; (c) cars weighing between 400 and 600 kilogrammes; (d) four-seated cars weighing between 600 and 1,000 kilogrammes; and (e) cars weighing over 1,000 kilogrammes. This race was interesting to English motorists in that among the list of entries appeared the names of Mr. Mark Mayhew and Mr. E. Hutton, members of the Automobile Club.

The signal in this race was given at 7 a.m., the starters being:—

Class A.—Busquet, Florès, Navello, Bensa, Heurtaud, and Cormier.

Class B.—Ferber, G. Richard I., G. Richard II., Florès, and Decauville.

Class C.—H. Rudeaux, Serpollet (Ratishauser), Cuchelet, Kreutler, Koechlin, Ravenez, and Cornilleau.

Class D.—Barbereau, Serpollet (Bernard), Serpollet, Rigoullot, Pinson (Brun), Letainturier, and Hutton.

Class E.—Sir Knapp, Champrobert, and De Fabrègues.

The first to reach Nice in this race was M. Serpollet, at 1.50 p.m. on a 12 h.p. steam car. The following is the official classification of the cars which had arrived up to 6.30 p.m.:—

FIG. 1.—THE M.M.C. MINIATURE PANHARD. (See next page.)

Baron de Caters, Pinson, Schneider, Degrais, Audibert, Lavirotte, and Ollion.

The start took place at 6 a.m., and the first to arrive back was Werner on Dr. Pascall's 35 h.p. Mercedes (German Daimler) car at 4.43 p.m. Demester came in next at 5.7 p.m. on his motor-tricycle. The contrôle was closed at 8 p.m., the official classification of the arrivals up to that time being as follows:—
Category A.—(1) Demester, 6 hrs. 54 min. 56 sec.; (2) Gleizes, 7 hrs. 11 min. 41 sec.; (3) Osmont, 7 hrs. 24 min. 14 sec.; (4) Bardin, 7 hrs. 43 min. 25 sec. Not placed: Beconnais (abandoned), Gasté (accident).

Category B.—(1) Henri Farman (14 h.p. Darracq), 8 hrs. 8 min. 35 sec.; (2) Edmond, 8 hrs. 18 min. 41 sec.; (3) Marcellin, 9 hrs. 5 min. 45 sec. Not placed: Baras, Boyer.

Category C.—(1) Docteur Pascal (Werner, *mecanicien*), 6 hrs. 45 min. 48 sec.; (2) Degrais, 7 hrs. 11 min. 58 sec.; (3) De Caters (40 h.p. Mors), 7 hrs. 14 min. 5 sec.; (4) Schneider, 7 hrs. 21 min. 54 sec.; (5) Loraine Barrow, 7 hrs. 24 min. 40 sec.; (6) Paul Chauchard, 7 hrs. 33 min. 59 sec.; (7) Marge, 8 hrs. 25 min. 1 sec.; (8) Stead, 8 hrs. 49 min. 50 sec. Not placed: Lemaitre, Pinson, Audibert, Lavirotte, Ollion.

The race for touring cars, which took place over the Nice-Frejus-Le Muy-Trans-Druguignan-Frejus-Nice route (198 kilo-

Class A.—(1) Cormier, 3 hrs. 24 min. 23 sec.; (2) Bensa, 4 hrs. 20 min. 35 sec.; Not classed: Heurtaud, Werner, Florès, and Navello.

Class B.—(1) Decauville, 3 hrs. 46 min. 19 sec.; (2) Florès, 4 hrs. 18 min. 36 sec.; (3) Capitaine Ferber, 5 hrs. 27 min. 33 sec.

Class C.—(1) Kœchlin, (7 h.p. Peugeot), 3 hrs. 11 min. 11 sec.; (2) Cuchelet, 3 hrs. 16 min. 35 sec.; (3) Ratishauser (Serpollet) 3 hrs. 18 min. 15 sec.; (4) Ravenez, 3 hrs. 19 min. 39 sec.; (5) Rudeaux, 3 hrs. 56 min. 35 sec.; (6) Cornilleau, 5 hrs. 17 min. 12 sec. Not classed: Kreutler.

Class D.—(1) Serpollet, 2 hrs. 42 min. 37 sec.; (2) Pinson, 3 hrs. 7 min. 31 sec.; (3) Hutton, 3 hrs. 43 min. 27 sec.; (4) Rigoullot, 3 hrs. 59 min. 58 sec.; (5) Bernard (Serpollet), 4 hrs. 8 min. 2 sec.; (6) Barbereau, 4 hrs. 11 min. 31 sec. Not placed: Letainturier.

Class E.—(1) Sir Knapp (M. Thorn) (35 h.p. Mercedes), 3 hrs. 40 min. 10 sec.; (2) De Fabrègues, 3 hrs. 41 min. 7 sec.; (3) Champrobert, 6 hrs. 55 min. 43 sec.

Both races were full of exciting incidents. We congratulate Mr. Hutton on the success which has crowned his efforts in a Continental automobile race, the more so in that he forfeited his chance for first place by stopping to pick up and convey to

Frejus M. Letainturier, whose automobile had overturned, and who was badly hurt. As far as we can learn Mr. Mark Mayhew did not start.

On Tuesday and Wednesday the competing vehicles were placed on exhibition, while on Thursday the flying start mile race on the Promenade des Anglais in Nice took place. The results, however, had not reached us before going to press.

THE *Court Journal* remarks that the latest votary to the ranks of Royal motor-car owners is the Duke of Oporto, the only brother of the King of Portugal, who, during his latest visit to Paris, learnt to drive an automobile, and who took a motor-car back with him to Lisbon. Since his return his Royal Highness has spent a great part of his time in driving about the neighbourhood of the Portuguese capital.

THE automobile is gaining an entrance in all phases of work, and in all parts of the world. It has invaded Arizona, and will compete with the railway and supplement the stage coach as a means of reaching the Grand Cañon. If plans as at present under way are carried out, it will be possible for passengers to leave the Santa Fé route train at Flagstaff, Arizona, and ride over to the Grand Cañon, about sixty miles away, on a motor-bus. The novelty of a ride in an automobile more than a mile above the sea level should add

immensely to the enjoyment of those who make the trip.

THE Hozier Engineering Company, Limited, of Hozier Street, Bridgeton, Glasgow, have sent us a copy of their 1901 catalogue, which gives particulars of the various types of Argyll voiturettes ranging from 2½ h.p. up to 5 h.p. The list concludes with three pages devoted to some useful hints to users of these cars.

THE M.M.C. MINIATURE PANHARD CAR.

IN our report of the National Show in December we briefly alluded to the new light car which the Motor Manufacturing Company, Ltd., has introduced under the name "Miniature Panhard." We are now able to publish an illustration showing a general view of the car (Fig. 1), and also a

diagrammatic elevation and plans (Figs. 2 and 3), showing the arrangement of the motor and transmission gear.

The engine, which is located under a bonnet in the fore part of the frame, is a vertical single cylinder De Dion manufactured by the company, and embodying certain modifications introduced by Mr. G. Iden. While rated at 5 h.p., we understand that the company are now getting over 5½ h.p. out of these engines, so that the vehicle can be relied upon to ascend hills at a fair rate and to attain a good speed on the level when required.

The water circulation is maintained by a pump, and a radiating coil is also provided. Coming now to the transmission mechanism, this is on the lines of that adopted in the Panhard cars, three speeds forward and a reverse motion being provided. The motor-shaft transmits its power through a friction clutch to the gear box, containing a train of tooth wheels, gearing with corresponding pinions on a parallel shaft below.

All the spur wheels are continually in engagement, but only one pair drives at a time, any desired pair being made to transmit the power by a sliding clutch, which locks or unlocks them from the shaft on which they revolve when free, and by which they are driven when locked. The lower parallel shaft projects through the rear end of the gear box and terminates in a bevel wheel, gearing with

FIGS. 2 AND 3.—ELEVATION AND PLAN OF M.M.C. MINIATURE PANHARD.

| 13. Axle swivel arms. | 29. Carburettor. | 44. Starting handle. |

a corresponding wheel on a cross differential shaft, from which the power is transmitted to the rear road wheels by the usual duplicate set of sprocket wheels and chains. The forward and reverse motions are controlled by a single hand lever arranged at the side of the sloping steering pillar. The steering is controlled by an irreversible hand wheel, motion being given through a worm on to a toothed segment. The various control levers are all worked from the standard in a handy position below the wheel. The brakes consist of a band on the differential on the countershaft, actuated by a foot pedal, and hand brakes, on drums connected with each of the chain rings on the rear axle, applied by a hand lever at the side of the car. The road wheels are of the artillery type, those at the rear being 28 in. in diameter, and the front 26 in.; they are fitted with Clipper pneumatic tires. The car complete weighs about 7 cwt. The petrol tank has a capacity sufficient for a journey of 100 miles.

The illustration (Fig. 1) represents the car recently supplied to Lord Plunkett, at the Viceregal Lodge, Dublin; as will be seen, it is extremely well finished and luxuriously upholstered.

THE GORDON-BENNETT CUP RACE:

AT a meeting of the Races Committee of the Automobile Club last week, the following decisions with reference to the English competitors were arrived at and agreed to by the competitors:—

Selection.—The Races Committee, for the purpose of determining which of the competitors shall be selected to represent the United Kingdom in the race, will arrange a trial of each of the vehicles over about 100 miles of road in France. An observer appointed by the Committee will be on each of the cars during its trial. The Races Committee, after receiving the records and reports of the observer, will select the three cars. The trials will take place within a fortnight of the date of the race. The competing cars must be in Paris at a place to be hereafter named by the Committee, and must be prepared to undergo the trial on and from Wednesday, May 15th. In the event of only three vehicles being forthcoming at the eliminating trials, the Races Committee need not necessarily agree to all of these vehicles competing in the Gordon-Bennett race, but may select one or more of the three as may seem best to the Committee.

Reserve Competitor.—The Races Committee reserve to themselves the right to nominate in addition to the three selected competitors a reserve competitor, and to substitute the reserve competitor for one of the selected competitors even at the last moment, without giving a reason, and competitors are required to abide by the decision of the Committee in this respect.

Construction of Competing Cars.—In view of the rule which stipulates that the competing cars shall be entirely, and in respect of all their parts, constructed in the country which they represent, the Races Committee will not allow a vehicle to compete in the eliminating trials unless the owner is able to produce a written certificate by the makers that the vehicle is, as regards all its parts, constructed in the United Kingdom; further, the Races Committee will not accept a vehicle for competition in the eliminating trials unless an Inspector, to be appointed by the Club, shall be allowed to inspect every portion of the vehicle during and after its construction.

Spare Tires and Petroleum Spirit.—Competitors will make such arrangements as they think proper on the road for the supply of petroleum spirit and spare tires.

Storage of Vehicles in or near Paris.—The Races Committee will endeavour to provide a building in or near Paris in which the competing vehicles may be stored from the 15th May until the start of the race.

Physical Fitness of Competitors.—In view of the great physical strain which will be involved by taking part in this race, and of the fact that the competitors will be representing the United Kingdom, the Races Committee require that competitors shall agree to abide by the rules and directions of the Races Committee concerning their personal training, of their mechanicians, during the week immediately preceding the race. Competitors and mechanicians will be required to agree to live under the supervision of a member of the Committee during that week, and to abide by the instructions of the Committee as regards the hour for retiring to rest, regularity in taking meals, etc.

CORRESPONDENCE.

A SUGGESTED NEW CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I heartily agree with the suggestion of "Novice" that a motor-car club should be formed, members to have the use of cars on certain days, and hope the matter will not be allowed to drop. The subscription, however, might have to be high until the cars were purchased, but this would be small compared with the cost of a complete car. Trusting the proposal may meet with practical support,—Yours truly,
"MOBILE."

GEARS AND IGNITION FOR MOTOR-QUADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your issue of the 23rd last that "G." states that he can fully charge his Woven-glass cells in four minutes.* Surely minutes must be a mistake, as it requires about four hours at the least to charge a battery of that capacity, at all events, without igniting the plates. As regards charging the cells off ordinary direct current mains the chief point to look to is to see that the poles are connected upright, and that a suitable resistance is put in circuit. An ordinary glow lamp will do, though the light will be a trifle less. The cost of charging two cells at 6d. per unit would be about 2s., but if the lamp is used for lighting purposes, of course the actual cost is next to nothing. I have never tried running a dynamo off the motor for charging the cells, but I see no reason at all for its not being a success. One or two makes of cars use a dynamo running off the motor to give the charge. A dynamo running off the motor of course absorbs a small amount of power, and care would have to be taken not to switch the dynamo on to the accumulators when the engine is not running at a sufficiently high speed, otherwise the cells would discharge themselves through the dynamo.—Yours truly,

C. P. COBB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Chum" will try a 22-tooth pinion on his Allard, it will do all he wants. I had the same trouble with mine till I changed the 18-tooth pinion to 20, and afterwards to 22. As regards accumulators, I find Peto and Radford's the best.

Yours truly,

G. T. TAYLOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in your correspondence columns the last week or two re gears and other matters for motor-cycles. Your correspondent "G." seems to have got over a difficulty we most of us experience, viz., hill mounting, by means of a two-speed gear. I have a 66 mm. Beeston tricycle, which goes fairly well upon ordinary slopes. I have gone up 1 in 13 assisting with the pedals; but we have hills here in Yorkshire 1 in 8 and even more. I see "G.'s" quad baulked at 1 in 17 before he got his two-speed gear.

The price demanded for two-speed gears seems to me to be excessive—in England that is to say. Would it be too much to ask "G." to give a detailed description of his Dupont gear and also some idea of the cost, which he describes as moderate? I also gather that one can have a free motor with the Dupont, and further that it is simple in action.—Yours truly,

CHAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "G." has given us some very interesting particulars and experiences. I should like to suggest that his motor-quad is underpowered, however, and that if he exchanged it for a 3 h.p. with water-cooled head he would scarcely feel the want of his two-speed gear. From what I have heard of the Dupont gear, I believe it is fairly good, but I think I am right in saying that a vast amount of power is consumed in

* "G." has written to point out that the words "minutes" in his last letter should have been "units."—ED. [M.C.J.]

transmission when running on the lower speed.—My own experience of motor-cycling leads me to believe that its best to have a well-powered—not under $2\frac{3}{4}$ h.p. for a trike—and about $3\frac{1}{2}$ h.p. water-cooled for a quad—without a two-speed gear and its attendant complications, but with a really large compression tap, so that when this tap is fully open the “shoving” process is devoid of most of its horrors.—Yours faithfully,

CLAUDE A. P. TRUMAN,
Hon. Sec. R.A.C.

A PERFECT MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A “perfect” motor-tricycle with the motor in a position which necessitates the dismantling of the front wheel to enable one to make thorough inspection or repairs hardly justifies its name. Moreover, who would care to use a tricycle weighing as a minimum 100lb., unassisted by a motor, for “desirable exercise”? A motor placed as in the Ariel, but controlled as in the Singer bicycle, *i.e.*, by one lever, magneto

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is not your correspondent Mr. Athol Maudslay going rather out of his way to obtain a “perfect” tricycle? The idea of placing the motor in front, *a la* Singer, is simply one, I suppose, to reduce vibration and render the machine convertible into an ordinary (?) tricycle. It would look an ordinary tricycle, wouldn't it, with Referee triple head and cross-frame, and one or two other additions? I venture to think that the pleasures of riding that tricycle would be strictly confined to it in conjunction with the motor, and not as an “ordinary” tricycle. As this is not a cycling journal we will not enter into the merits of the Referee cross frame, but I am interested to know, *why* the Referee? No, I do not think that our manufacturers will take up this idea, as the ordinary motor-tricycle has practically all the points mentioned by your correspondent, except the convertibility. I am inclined to think the back is far from the best position for a motor on a tricycle, for reasons which are more or less obvious, and I also feel sure that the Singer motor-tricycle is not intended to compete, say, with a $2\frac{3}{4}$ h.p. De Dion with clutch. I should

THE “LOCOMOBILE” IN CALIFORNIA AND YOSEMITE.

ignition, water-cooled head, well-designed friction clutch, which should neither slip nor jam as many do at present, with, as Mr. Maudslay suggests, non-vibratory saddle and handle-bars, non-puncturable tires and powerful hand-brakes on rear hub, would, it seems to me, come nearer perfection, being so simple that a beginner could easily manage it as soon as he understood the manipulation of the friction clutch.—Yours truly,

FIELDFARE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the letter on this subject in your last issue, I may mention that I have designed a front driving and steering motor-tricycle, for which a patent is pending; also a very small carriage for one person. Both vehicles are designed for the wheels at the rear to close up, so as to pass through any house-door frame. The small carriage has no pedals, the motor being fixed on the front of the frame of the carriage. The engine can be started from the seat. The variable-speed gear employed is silent, and will give speeds ranging from a crawl up to twenty miles per hour with one lever.—Yours truly,

GEO. FREESTONE.

be pleased to hear the views of others on this interesting subject.
—Yours truly,

R. A. COBB.

FUEL FOR MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would any reader who has been “held up” through the petrol petering out (save the mark!) say if ordinary paraffin oil could by any means be used as a makeshift? The result of his experiences would probably be interesting to others beside—

Yours truly,

BEGINNER.

THE ASTER MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a letter, entitled “Motor-Cycle Matters,” which appeared in your issue of the 16th inst., your correspondent “G.” speaks in high terms of the Aster engine and its carburettor. I have also had a Phébus-Aster for about a year and a-half, and have been perfectly delighted with it. Mine is a 4 h.p. tricycle, but it was fitted with a Longuemare carburettor. Previous to possessing this tricycle I had two De Dion trikes, so I am able to compare them with the Aster, a comparison that by

no means goes in favour of the latter. I quite agree with "G." that were the Aster engines better known in England they would be very much more used than at present. People that have once had an Aster do not usually return to a De Dion. The Aster engine runs very smoothly, with marked regularity, and is more silent than the De Dion. It is very fast, very powerful, made with the greatest care and precision. Passing over many points of excellence and superiority in the Aster motor, it is impossible to refrain from speaking of the Aster ignition. It is inexplicable how De Dion can still go on turning out his engines with the same old ignition, utterly regardless and indifferent to the many complaints continually made about it. To thoroughly understand the De Dion ignition you have got to be a good mechanic, experienced, and possessed of a good ear for sound. The trembler is always disarranging itself, and needs constant adjustment. The oil from the crank chamber pours in there, no matter how little you put in the engine, keeping the trembler box flooded and covered with oil inside and out. The trembler box in an engine should be clean and dry. The inside of this in the De Dions is always an oily, filthy mess. Owing to this one suffers from short circuits constantly, the whole affair having to be cleaned and recleaned very often. Whenever one has to readjust the trembler it is necessary to unscrew the locking screw holding the platinum-tipped screw in place. In the De Dion ignition this screw is put in the most inaccessible position. Another source of trouble with the ignition is the ebonite stand wearing loose and therefore greatly upsetting the sparking. Sometimes it cracks and splits right across. This has happened to me more than once. I had my Aster tricycle four months, during which I never had occasion to touch the trembler. There is a trembler blade for the make and break contact on the Aster engines, but it is not intended to vibrate. This was well adjusted when I bought the machine and never once disarranged itself. At the end of that time, my engine began to make feeble explosions and to miss them sometimes. I looked over the ignition and found that both the trembler blade and the platinum-tipped screw were completely worn out. But they had lasted well, never once requiring to be touched. I recollect being *en panne* with my ignition on a track at Strabane once last year. Here the trembler was looked at but the fault was not there, it all consisted in an earth-wire having broken, which was not at first perceived.

Now to compare the Aster with the De Dion ignition. The former is contrary to the latter. One has not got to be a good mechanic to understand the Aster. A novice can grasp it almost at the first glance. There is no ebonite cam to wear loose or split. There is no special vibration of the trembler blade required. That in the Aster is not intended to do so, and that saves one an immense deal of trouble and experimenting. You might fill your Aster engine with oil, but your trembler box inside would always be as dry as tinder. The adjusting of the Aster make-and-break contact is simplicity itself. Screw up the trembler blade so that the end presses firmly upon the cam, advance the platinum tipped screw as near to it as it will go, so that you can just insert a visiting card between the two, and there you are, quite complete.—Yours truly,

LEOPOLD CANNING, A.C.G.B., A.C.N., etc.

A SINGLE-SEATED CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the feasibility of the production of a covered tricycle, as suggested by your correspondent Athol Maudslay, in my opinion it is not only possible, but its actual appearance at no distant date is very probable, if my eight years' practical mechanical experience qualifies me to express an opinion. The body need only be very light and easily detached. The hood could be closed right up, leaving the rider entirely closed in from hail or sleet, with transparent celluloid panels inserted in front, side, and rear of hood or cover, to allow him or her to see in front, beside, or behind. The steering control, brake, and even the lamps could be worked from inside. He may have to encounter a deal of obstacles in getting one made as a start, as every new departure has to submit to a great amount of criticism and often ridicule until it has really demonstrated its convincing practicability. No one can say that

improvements are impossible; many have yet to come, and your correspondence columns should prove very interesting during the coming season.

Motors have got to occupy a great position, and the public will catch on like the wind when they think them more simple and lighter; but unfortunately there are still many who think a breakdown gang should be kept in sight if you keep a motor. This will wear away like all other notions.

I shall be trying a few useful experiments and shall be pleased to hear through your columns of others similarly interested. Exchange of opinion and results of experience and experiments should prove interesting and profitable to all concerned.

Re the proposition of "G." to have a dynamo fixed to his quad, the motor to work the dynamo, and that in turn to charge his accumulator, a friend is trying same, but with the difference that he works his dynamo chiefly by means of a rolling brake; thus the lost power in ordinary brakes is utilised in this case (in descending hills, etc.) to work the dynamo and thus recharge the accumulator; with what results more will be known presently.—Yours faithfully,

W. W. STEVENS.

6-H.P. PANHARD CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers oblige me with information of 6 h.p. Panhard cars—as to their wearing qualities? How many miles should the gear run—any part of it—without renewing? How long do the piston rings, bushes in the engine, and chains and sprockets last?—Yours truly,

PHOENIX.

M. CHARRON, the well-known French *chauffeur*, has, we hear, this week paid a flying visit to London.

LES ÉTABLISSEMENTS PIEPER OF LIEGE, have sent us a copy of their catalogue illustrating and describing the new Pieper light car fitted with a 6 or 8 h.p. motor and the popular *tonneau* body.

At the recent race meeting held at Nice, the winning cars in Series C. Course de Vitesse and Series E. Course de Touristes (both 35 h.p. vehicles) were, we understand, both fitted with tires supplied by the Continental Caoutchouc and Guttapercha Company.

THE United Motor Industries, 40, Holborn Viaduct, E.C., have appointed Mr. W. H. Kingsbury, of 61, Bath Street, Glasgow, and De Dion-Bouton, Scotland, their agent for Scotland. Motorists, north of the Border, will no doubt find this arrangement a great convenience to them, as the United Motor Industries, Ltd., handle practically all the requirements of a motorist.

At a meeting of the Glasgow Corporation last week, Mr. Stewart asked when the motor-car for the cleansing department, which had been ordered two or three times, and was to have been ready six weeks ago, was going to be delivered? Mr. Battersby, in reply, stated that the car would be in working order in a certain time, probably in the course of three months.

WE are asked to state that all enquiries in regard to Clipper-Michelin tires for motor-vehicles should be forwarded to the Clipper Pneumatic Tyre Co., Ltd., 164, Clerkenwell Road, London. We understand that all the sizes will be kept in stock and those not already received are expected in the course of the next few days from the Michelin Company's works in France.

THE Paris-Bordeaux Race is to be run immediately after the start of the Gordon-Bennett Race on Wednesday, the 29th May. It is divided into the following four categories:—1. Carriages weighing over 650 kilogs.; 2. Light carriages weighing between 400 and 650 kilogs.; 3. Voiturettes weighing from 250 to 400 kilogs.; 4. Motor-cycles weighing less than 250 kilogs.

TO-DAY'S (Saturday) run of the members of the Automobile Club has been altered from High Wycombe to Windsor. The start will be made at 1.45 p.m. and the route will be:—Hyde Park, Kensington, Hammersmith, Brentford and Colnbrook. The Hon. John Scott Montagu, M.P., has invited the members of the Club to attend a meeting of the Eton Beagles at Ditton House, Langley, near Colnbrook, and to take tea there afterwards. On leaving Ditton House the run will be continued to Windsor, where dinner will be served at the "Castle Hotel."

MOTORING ON THE ICE.

M. JACOT, OF THE SWISS AUTOMOBILE CLUB, WITH HIS DELAHAYE CAR, MOTORING ON THE RIVER DOUBS (EASTERN FRANCE).

Cliché de]

CONTINENTAL NOTES.

BY "AUTOMAN."

ALTHOUGH the new mode of transport has taken firm root in Belgium, the oldest and crudest form still holds its sway, and it is curious to see side by side the quaint little milk carts with their canine tractors and the latest petrol vans. The accompanying illustrations of a 3 dog-power cart and a 2½ h.p. van make an interesting and amusing comparison constantly to be witnessed in the streets of Brussels. The little motor-

THE OLD STYLE.

van is produced by the Usines Delin, Louvain, which is managed by the enterprising M. Chargois, who, by the way, exhibited at the Brussels Exhibition a motor-cycle which had covered 10,000 kilomètres.

THE Belgian Automobile Club, which held its annual general meeting on Wednesday, the 30th inst., announces that the charity fête which it is organising will take place on April 14th at 2 p.m. The programme will consist of five events, namely:—(1) A trial of skill; (2) a prize for elegance; (3) three combined movements; (4) a gymkhana; and (5) a battle of flowers. All kinds of vehicles will take part—omnibuses, lorries, touring and racing cars, delivery vans, voiturettes, and motor-cycles. Last year it was a great success, and this year it promises to be a brilliant affair.

THE French military authorities have not been long in realising the important rôle that the motor-car will undoubtedly play in future warfare, most particularly if the field of operations should be in an European country, where good roads abound. There is a kind of conscription for horses in France, that is to say, every horse in France is registered, labelled and described by the War Office and also valued, and in case of war the military organisers can lay their hands on all the horses—duly compensating the owners on a fixed scale. It is evident from a circular which has just been sent out by the chief officers of the artillery at Vincennes, near Paris, to all owners of motor-cars, that there is to be a conscription also for motor-cars. The circular asks for immediate returns of particulars with reference to purchase in case of mobilisation, of not only motor-cars but also motor-cycles. A preference is given to covered vehicles.

THE Automobile Club de France announces that it intends to hold two international competitive trials. The first, which is to be held at the Club's laboratory, 128, Rue du Bois, Levallois-Perret, beginning on May 1st, is to consist in a trial of carburettors. The different carburettors will be tested with a special petrol of 700 degrees of density, and with three classes of motors, viz., motors with a short stroke and high speed, motors with a medium stroke and medium speed, and motors with a long stroke and a low speed. Consumption of petrol per brake horse-power, and condition after ten consecutive hours' work and a night standing without being cleaned, will be the points specially looked into. The second competition, which is to be held at the same place, beginning on June 1st, is to be for accumulators, and the tests are to cover a period of one year, during which time each battery is to be subjected to various trials, taking into consideration cost, weight, and repairs.

THERE has been a signal success for motor-fire-engines in Paris, which should call the attention of other fire brigades to the advantages of motor-traction over horse traction. In this case it was an electric fire pump, carrying with it one hundred gallons of water ready for use, manufactured by Bouquet, Garcin and Schivre. Thanks to the rapidity with which this machine arrived on the scene and got to work, it was able to prevent the explosion of a cellar full of chemical products. The Colonel commanding the Paris fire brigade says in his report that with horses the engine would have arrived too late.

THE Swiss Automobile Club, which was founded towards the end of the year 1898 by a little group of motorists, has now about 400 members. It originated in a race organised from Geneva to Meillerie and back, about 110 kilomètres, but it was soon obliged to give up racing on account of the stringent laws of the country. The shortest course of fifty miles or so traverses thirty or forty villages, towns, or hamlets, each of which had to be gone through at a walking pace. The Swiss Automobile Club has set to work to get the motor-cars of tourists admitted duty free so long as the tourists are members of the Belgian or French Automobile Clubs, and expects very shortly to achieve its object; it has

THE NEW STYLE.—THE DELIN LIGHT DELIVERY VAN.

also been endeavouring to get the various regulations of the different cantons all settled according to central governmental instructions. Here they have met with a very unexpected difficulty. The Canton of Grisons has actually absolutely forbidden the circulation of motor-cars within its confines, and the S.A.C. is now considering what steps it will be necessary to take in face of this outrageous but very effective way of settling the question.

MICHELIN began in last Monday's *Auto-Vélo* a series of articles on pneumatic tires. Commencing by giving the elementary details of construction, he tells how the pneumatic tires consists of (1) the

air chamber; (2) the cover; (3) the rim. The air chamber, he says, is the soul of the pneumatic tire. It consists of an endless tube of rubber destined to receive compressed air, the compression of which varies according to the weight of the carriage and sometimes attains as much as five atmospheres—75 lbs. per square inch. The air chamber alone not being able to resist this pressure, an envelope of canvas is required to support the tube and prevent it from bursting. In order that the envelope may have the requisite strength three, four, or even five thicknesses of canvas are required. The outer canvas is covered with a layer of rubber thick enough to protect it from the road friction; this layer of rubber is made crescent shape. In large tires the outer rubber is made separate from the canvas in order that it may be easier to repair the one or the other. If the envelope should be pierced it can be repaired by means of a piece of rubber-treated canvas fixed inside. The envelope has at its edges two thicker pieces which fit under the hooked sides of the rim, and are also held in their places by safety bolts. In a later article Michelin says he will give the principal causes of wear and how they can be remedied. I will give your readers a digest of the next article when it appears.

FRANCE has been showering distinctions on motorists lately. M. Bouton, of the well-known firm of De Dion and Bouton, has been made a chevalier of the Legion of Honour, and so have M. H. Pieper, of Liège, and M. Brunetta d'Usseaux, a motorist, of Nice, who gave the cup which bears his name. There are four new officers of the Académie chosen from the automobile world, viz., M. de Morlhon de la Valette, secretary to the A.C.F., M. Petit, M. Richard, treasurer of the Chambre Syndicate de l'Automobile, and M. Vaugelle, secretary of the Chambre Syndicale du Cycle et de l'Automobile. Last Monday week was a holiday at the works of De Dion and Bouton, and the 1,500 workmen met together to present a diamond cross to M. Bouton in commemoration of the honour bestowed on him by the Council of the Legion of Honour.

WE learn that the Rt. Hon. A. J. Balfour has just ordered one of the new 7 h.p. Panhard light cars, the delivery of which will be made about May next.

A PLAYING card firm in America has copyrighted the words "motor" and "motorette," presumably for use as names for cards.

By a decree just issued, the Mayor of Cannes limits the speed of automobiles to twenty kilomètres per hour in open country and ten kilomètres in the streets.

THE Crowds Automobile Company has been lately formed in Illinois to build electrical vehicles. Mr. Crowds has been engaged for a long time in automobile work, having patented a very successful accumulator, of which he sold the English rights some two years ago. On his return to America in 1899, Mr. Crowds began the construction of complete vehicles, and has turned out a light vehicle, which is now to be built on a commercial scale.

IN accordance with a request made by the Committee of the Automobile Club, the Marquis of Lansdowne has instructed His Majesty's Ambassador at Paris to approach the French Government concerning an arrangement by which members of the A.C.G.B.I. may, on lodging the Customs dues at the London Club House, obtain there a form which will enable them to introduce their automobiles into France, without going through the usual Customs formalities.

THE U.S. Post Office Department intends to employ motor-cars in transferring mails from the Federal Building to the Pan-American Exhibition grounds at Buffalo, N.Y. Proposals have been asked for on the following terms: The distance is about 4.25 miles. Not more than seven nor less than five round trips are to be made each day. The cars are to be run according to a schedule between 4 o'clock in the morning and 11 o'clock at night. The running time for each trip, each way, is not to exceed thirty-five minutes, exclusive of loading and unloading. The vehicles must be capable of carrying 800 lbs. of mail matter.

THE "TWENTIETH-CENTURY" VOITURETTE.

THE Automobile Transport Company, of Comeragh Road, London, W., have put on the market a new voiturette, of which an outline illustration is given herewith. The petrol engine is placed under a bonnet in the forepart of the carriage; it is water-jacketed, the water being circulated by means of a pump. A radiator is fitted to cool the water. The standard horse-power of the voiturette is 3½, but the company are building cars with 5 and 7 h.p. engines. Ignition is effected by an electrical battery and induction coil. The transmission gear is of a simple description, and there are no complex parts to get broken or out of order. From the engine the power is transmitted by a belt to a countershaft having pinions upon it, which are always in mesh with spur-wheels fixed to the rear driving-axle. To this countershaft are also fitted hardwood pulleys for changes of speed and reversing gear. The whole of the engine is oiled by one sight feed lubricator; this being fixed on the dash-board behind the engine bonnet, the driver is enabled to see the quantity of oil contained. Petrol can be carried for a journey of about 150 miles. Band brakes are fitted to the hubs of the rear wheels, also to the driving gear, and are actuated by a foot-lever placed conveniently near

the driver. Steering is controlled by an inclined hand-wheel, on the right side of the carriage. The frame of the under-carriage is constructed of channel steel. The road-wheels are of the cycle or wooden artillery type as desired, and are fitted with pneumatic tires. The standard types of bodies are two-seated Victorias; a third seat can be fixed in front. The main under-frames, however, are so designed that almost any description of body can be built thereto.

THE Veloce Club of Namur, Belgium, is organising a motor-car race from Namur to Bastogne and back (112 miles) to be run off on June 2nd.

MR. A. W. BELL, cycle manufacturer, High Street and London Road, Marlborough, informs us that he has arranged to carry a stock of Carless-Capel petrol at each of his two depôts.

THE Anglo American Oil Co., Ltd., are now delivering Pratt's motor spirit in sealed 2-gallon tins, so that motorists can thus be assured that they are receiving motor spirit as filled and shipped from the Company's works.

IN his annual report, Mr. Ellicott, the City Electrician of Chicago, who has charge of the granting of licences to drivers of motor-cars, pays the new conveyance this compliment. "The results thus far obtained indicate that the automobile is a safe means of transportation if operated by a reasonably intelligent and careful person."

JOTTINGS BY A WORLDLING.

OUR sport has never had such a fillip as that given to it by the success of the German car at Nice and by the "triumph of steam," as Léon Serpollet calls his victory in the tourist race. Baron H. de Rothschild's clever *mécanicien*, Werner, has proved, what a few of us have always held, that the Daimler would one day "come out on top," and that the rotary German magneto ignition is worthy of much more attention than has yet been given to it. The Mercedes car behaved as well as, if not actually better than, any other racer yet built, and it will be a dangerous rival to the Panhard and Mors systems. Should our high-power cars prove as successful as their manufacturers believe they will be, the Gordon-Bennett Cup will be one of the most exciting sporting events that the world has ever seen.

WHEN I read of the splendid performances of the Serpollet car in the Taunus mountains last summer I felt certain that its inventor would one day startle the petrol enthusiasts with some remarkable feat. I have never driven a motor-car in that part of the world, but I have often taken a team from Homburg to Nauheim, and the hills that those unhappy horses had to toil up would prove very trying to some of our best petrol cars. I have never been very enthusiastic about steamers myself, but with the account of the president of the Union Automobile's *course* before me I cannot but admit that our King and the Shah were very right in placing orders with him.

BARON DE CATER, who in spite of bad luck did very well with his Mors, is a rich young Belgian who has tried almost every type of car built. I had the pleasure of meeting him at the Laiterie in the Bois de la Cambre a few months ago, and he talked automobilism for a long time to the unaffected disgust of our less interested friends. He heaped anathema on the horrible roads of his country, on the ridiculous number law, and on the stupid policeman. He is a thorough sportsman and deserves every success.

THE road on which the race was run is one of the most perfect in Europe. Broad and well laid, with sufficient rise and fall to make it interesting, it passes through some of the most beautiful scenery in Southern Europe, though this consideration does not go for much with the excited *chauffeurs*. It was, I understand, very heavy in parts, and this may account for the rather poor time of the 50-h.p. car, but anything is better than the terrible dust that usually lies inches deep on its surface at this period of the year. So bad is it as a rule that none but the most courageous ladies dare risk the ravages it makes on hair and *toilette*, and it is very difficult to persuade them to take even so short a run as from Monte Carlo to Cannes. I remember once driving three ladies in a large Panhard from the Paris to the Réserve, on the Croisette. They were neophytes and trusted me; the result was that when we arrived at Jean's excellent little restaurant I was the most unpopular man on the Riviera. They were, however, put into a good humour by helping to catch a *langouste* and subsequently eating him *à l'Américaine*, and by watching a fishing competition at which King Edward assisted.

THIS incident recalls to my mind another in which a "hippomobile" played the principal part. Homburg *habitues* will remember a terrible 6 or 8 h.p. vehicle we used to call the "Ark" and hire for picnic purposes. One day we made up a large party to drive over for lunch to some neighbouring village, but just as we were reaching our destination a summer storm drenched us to the skin. We arrived at our destination, and a room was found in the little hotel for the ladies to dry themselves in. They promised to be back in twenty minutes, and we men were left to make shift with some towels and the kitchen fire. We waited over an hour till they joined us. The explanation of their tardiness that we extracted was that among them was an "angel"—from Boston, by the way—who

had had the forethought to take a pair of folding tongs in her pocket! From this I illogically deduce that the fair sex is better off in a motor car than in a horse-drawn carriage.

LAOCOON said "Times Danaos et dona ferentes," about a mechanical horse. Charron might quote him to-day if he looks on that 10,000 francs in the light of a gift, as he professes to. I had a chat with M. Canellopoulos about this great car that bears part of his name, and he is satisfied that it will do the two kilomètres in the minute. This is the only point of the bet, because the manufacturer, of course, knows the weight, etc. Seventy h.p. and seventy-five miles an hour? With the eight cylinders it ought to be possible, especially as the pace need only be kept up for a short distance. But even if M. Canellopoulos wins his bet it does not at all follow that the Gordon-Bennett Race is a "soft thing" for him. The conditions will be very different and the trial much more severe.

ONE of the latest "horsey" converts to automobilism is Mr. Brisco Ray. I saw him on a Canadian electric car in the City the other day. He had on a square bowler, a box coat, and a white stock with a pin in it that consisted of an enamel picture of a coach drawn by four horses! Excellent! We'll soon have Mr. Harry Goodbun selling motor-cars in the Lane.

A WELL-KNOWN actor whom I was driving the other day said, "This might be called 'a spirited movement,'" but I did not strike him, although he had been guilty of the "stormy petrol" pun earlier in the day.

A WEEK or two ago I had to pay a shilling for leaving my car in the yard of the Greyhound at Richmond while I had lunch. *Caveat Viator!*

MESSRS. JULIUS HARVEY AND CO., of 11, Queen Victoria Street, E.C., have just shipped a large steam motor-van to the United States. This motor, which is oil fired, has been selected by Messrs. Harvey's customer as the most efficient, after a thorough investigation of the various systems in use in England and on the Continent.

ACCUMULATOR INDUSTRIES, Limited, of Silver Street, Bloomsbury, W.C., have sent us a copy of their new catalogue giving full particulars of the constant current primary battery known as the Cupron Element, to which reference was made in our last issue. The list also includes useful instructions for installing the cells, which are made in a number of sizes, mixing the electrolyte, etc.

THE New Orleans Motor Company, Ltd., has been registered with a capital of £20,000 to acquire the business of engineers and motor-car manufacturers, now carried on by Burford, Van Toll and Company, to adopt an agreement with F. A. Rodewald and the Société des Ateliers Vivinus. The first directors are F. A. Rodewald, Count J. de Liederkerke, Count M. de Bousies, and A. Vivanus. The registered office is at Holly Place, Twickenham.

ISSUES have been ordered in the Court of Session for the trial of an action in which a mining engineer sues the Edinburgh Autocar Company for £2,000 for bodily injuries. He was knocked down by one of the defendants' motor-cars in Princes Street, Edinburgh, owing, it is alleged, to the driver being inexperienced and failing to keep a proper look-out. The defendants, on the other hand, put the blame on the pursuer, and say that if he had taken the least care the accident would not have happened.

THE Pick Motor Company, Limited, has been registered with a capital of £10,000, to take over the business of bicycle and motor-car manufacturers and repairers now carried on by J. H. Pick and C. Gray, at Stamford, Lincolnshire, and to carry on the business of engine, carriage, and machine makers, etc. No initial public issue. The directors are the Marquess of Exeter, Sir G. Whichcote, W. Bean, and C. Gray. The registered office is at 5, Blackfriars Street, Stamford.

THE GARDNER-SERPOLLET STEAM CAR.

CONSIDERABLE prominence has recently been given in automobile circles to the latest type of steam vehicles now being turned out by the Gardner-Serpellet Company, of Rue Stendhal, Paris. This is due partly to the attention the

FIG. 1.—THE 8 H.P. SERPOLLET STEAM CAR.

cars have recently been receiving at the hands of Royalty, and in view of the success of M. Serpillet at Nice this week a detailed description of his vehicles may not be without interest. The car illustrated in Fig. 1 is of 8 h.p., and, as will be seen, takes the form of a four-seated phaeton with hood and canopy.

About two years ago (see issue of March 31st, 1899) we published a description and illustrations of some of the details of these cars, but in view of the attention now being paid to them, some further particulars may not be without interest. The name of M. L. Serpillet is intimately associated with the development of steam automobilism. In 1887 he built a steam tricycle in which coal was used as fuel. Four years later he constructed several superheated-steam carriages which proved remarkably successful. A few of these old vehicles are said to be still in use. At that time (1891) Serpillet enjoyed the distinction of being the only *chauffeur* to whom the authorities of the city of Paris had accorded the privilege of driving an automobile through the streets. He also took part in the early motor-carriage contests, among others in the Paris-Bordeaux race. Although he devoted his attention to the building of tramways for the city of Paris after his automobile experiences, he never abandoned the idea of producing a practicable steam-carriage. Coal, he soon discovered, could not be satisfactorily used as a fuel in automobiles. Then he tried oil. For three years he laboured to devise a means for employing petroleum. His work finally culminated in the system of burners which is now used on all his vehicles.

To begin our description of the cars it may be stated that they are being made in four sizes, 5, 8, 10, and 12 h.p., the general arrangement, however, being practically the same. Referring to the plan and elevation (Figs. 3 and 4), it will be seen that the motor is placed in the centre of the frame, the boiler being

carried behind. Provision is made for sufficient oil and water to be carried for a run of sixty miles. Practically the whole of the mechanism is mounted on a single plate attached to the frame by four bolts, which facilitates inspection or the carrying out of any necessary repairs.

Turning to the generator, we find it to be of the instantaneous vaporisation type without any appreciable capacity. It consists of a series of horizontal coils of round tubes, each coil being joined with the next by short lengths of tubes fastened outside the boiler shell by nuts. In the event of one coil deteriorating, it can thus be very easily and promptly isolated. The boiler is packed with sheets of asbestos. The circulation is forced, and when in running order it contains no reserve of steam or of water. At each instant, and corresponding to the requirements of the motor, there is admitted to the generator a certain quantity of water, which is converted instantly into steam. This is effected by the heat supplied from a series of Bunsen-like burners, employing ordinary lamp oil as fuel. In common with all builders of steam-cars, M. Serpillet claims for his generator that fouling is an impossibility, and puts forward the following reasons in support of his contention: 1. The considerable speed of the circulation prevents the formation of deposits. 2. The variation of the feed displaces continually the point of vaporisation where the deposits have a tendency to form. 3. The frequent cleansings, whether those automatically provoked by the play of the safety valve or those caused by the wide opening of this valve each time the car is finished with, produce a violent return of steam and air which sweeps the interior surface of the tubes. 4. The condensation of the exhaust steam partially cleanses the feed water, and finally the drops of oil forced into the reservoir, and which occasionally are drawn into the tubes, prevent the adhesion of deposits. Connecting the generators and the motor there is a special feed apparatus (Fig. 2) which varies the production of steam as may be desired. To

FIG. 2.—DIAGRAM SHOWING WATER AND FUEL FEED CONTROL.

[Le Chauffeur.]

effect this, not only is the quantity of water admitted to the boiler exactly regulated, but also the oil burned by the lamps, so that the diminution of heat is always followed by a corresponding diminution in the water supply and *vice versa*. The connection of the pumps feeding respectively the burners and the boiler brings about this effect, which results in great economy of both oil and water

The motor consists of four cylinders, grouped *vis-à-vis*, or at an angle of 45 degrees, and each of these cylinders is absolutely like that of a petrol motor. By this means the ever-troublesome stuffing-boxes have been entirely suppressed, and with them the loss of power, which exists in the best constructed steam engines, and which on small motors assumes sensible proportions. The connecting rods are attached direct to the pistons, of which the steam tightness is secured by a series of three piston rings. The usual slide valves and fittings are also suppressed, the distribution being secured by means of valves actioned by a succession of cams keyed on to the commanding shaft. On starting the engine the shaft is forced to the end of its course, and it always happens that one at least, and often two valves are found in the position of admission; the third, or two others, as the case may be, being in the position of escapement. The reversing of the engine is obtained by an inverse admission secured by changing the position of the cams, instead of reversing the slide valve as usually done on steam motors. One of the features of the engine is the means employed for the variation of the force. This is achieved by the lateral displacement of the cam shaft and the corresponding variation in the length of time during which the valves are open, with a like increase or diminution in the amount of steam admitted to the cylinders.

Referring to Figs. 3 and 4, *P* is the petrol tank, in which a certain pressure is maintained by means of the pump. The water tank is located in the front of the car at *O*. The automatic petrol supply pump is located at *F*, and that for the water at *G*. The hand lever *L* at the right of the driver is employed in starting up the boiler, the lever operating a pump, which injects a certain amount of water into the boiler. The admission of steam from the boiler to the engine is controlled by a foot pedal *D*. The steering is of the irreversible type, and is actuated through the medium of a horizontal hand wheel. Upon the steering pillar are found a couple of small levers, the one acting upon the pumps, and varying the quantity of water and simultaneously the quantity of oil injected, and the other actuating the cam shaft and permitting, following its position, forward and reverse motions, and stop. Two pedals project through the foot-boards, and operate respectively a brake of the Lemoine type and the admission of steam from the boiler to the motor. Several Serpollet cars will be on view at the forthcoming exhibition at the Agricultural Hall.

ACCORDING to the *Auto-Vélo*, M. Jenatzy and two other *chauffeurs* are having special cars built at Herstal, near Liège, for the Paris-Berlin race. They will be driven by combined petrol and electric motors, developing, it is said, 100 h.p.

INCANDESCENT TUBE V. ELECTRIC IGNITION.

EVEN to-day, after all the advances that have been made in electric ignition, there are many who consider the incandescent tube the most reliable and the one which is easiest kept in order by motorists with little knowledge of things electrical and mechanical. When considering the question of the superiority of one of several alternative devices, it is, of course, necessary to take into account all the conditions which accompany their operation. As against a probable greater reliability of the incandescent tube as regards ignition there is with this method of ignition a certain danger—that accompanying the use of an open flame in proximity to a store of petroleum spirit, which is certainly increased when both burner and petrol reservoir are mounted on wheels and are liable to all such disturbances as may befall a swiftly-moving road machine.

This element of danger has certainly been the reason why many manufacturers from the start have uniformly adopted electric ignition, and why, even in spite of the fact that, as one user puts it, "probably 90 per cent. of all the troubles with petrol vehicles are due to mishaps to the electric ignition," there does not seem to be the slightest tendency towards tube ignition.

In Europe many of the manufacturers of heavier vehicles who started out by using Daimler motors (Peugeot, De Dietrich) are still largely using the incandescent tube. With small high-speed motors tube ignition has never been used, for the very valid reason that these motors, to give the best results in power, must be equipped with a device by which the time of ignition can be changed instantly

and with certainty, which is impossible with the incandescent tube.

Electric ignition is constantly being improved, and there is no doubt that before long we shall, remarks the *Horseless Age*, have improved devices that will avoid many of the difficulties to which they are liable at present. The improvements which have been made in recent years cover all the elements of the ignition outfit—the current generator, the coils and the manner of protecting them, and the spark terminals or plugs.

With the great improvements of which electric ignition is still capable, and in the many efforts which are now being exerted in that direction, it is pretty safe to predict that electric ignition will never be overtaken by tube ignition, although, as entirely new types may eventually make their appearance, it might be unsafe to consider it the final type of ignition.

FIG. 3.—ELEVATION OF FRAME OF SERPOLLET STEAM CAR.

FIG. 4.—PLAN OF SERPOLLET STEAM CAR.

THE "HUDD" SPARKING PLUG.

THERE has just been put on the market by the "Hudd" Syndicate, of 27, Fumival Street, Holborn, E.C., a sparking plug which, while not departing materially from the standard plugs now in use, is claimed to possess several advantages. The platinum points are completely protected by the extension of the casing, so that, even without a case, the plug will stand a fair amount of knocking about. The connection is made by a hook, so that the wire can be disconnected from the

FIG. 1.

plug instantaneously. At the same time the wire cannot be broken, while the electric connection is claimed to be absolutely perfect. Moisture cannot get in between the insulated wire and the plug, while the parts cannot be moved or loosened when screwing up, and though breakages are very improbable, repairs are very easy.

Fig. 2 shows the plug in section and in Fig. 1 it is shown with the insulated wire from the coil, and a span hook for the insulated wire. A is the platinum wire completely protected by the extension or casing G. The central rod B carries at one end the central platinum point and at the other the terminal for connecting up. The porcelain filling C is held in the casing by the nut E and the asbestos washers D. Another asbestos washer, D, provides for any difference of expansion between the rod B and the porcelain. The screw K, with milled nut, takes

FIG. 2.

the "hook" connector H, which hooks on to it as shown in Fig. 1, and is held by the screw. The hook H has a hole drilled through it so as to take the clean copper wire cable J (with the insulation cut away, as usual) from the coil. This wire is held in the hole by soft solder, the clean wire cable being wrapped in tinfoil with a little powdered resin and then, put in place, warmed, the tinfoil melting and making the connection safe, the insulated wire coming flush up, but being encircled and gripped by the spiral spring, brazed to the hook H, so absolutely preventing breaking away or movement. The hook admits of the wire being set at any angle. We understand that the sparking plug, with other accessories, is part of a new two-cylinder engine to be shown at the forthcoming exhibition, and for which great claims are made. The plug will, however, be put on the market separately.

At a recent meeting of the Automobile Club of America, Mr. Cornelius J. Field, chairman of the Technical Committee, gave an interesting address on petrol cars, and how to operate them.

A RACE from Vienna to Budapest, to be run off in June next, is being organised by the Austrian Automobile Club. It will be run in three stages.

A PETROLEUM-SPIRIT DISTANCE CONTEST.

THE Automobile Club is organising a petroleum-spirit distance competition for Saturday, April 13th. It is intended that this trial should be a sporting event amongst members of the Club to ascertain the consumption of petroleum-spirit by their respective motor-vehicles over a given course. The trial will be confined to vehicles carrying more than one person, owned and driven by members of the Automobile Club or of affiliated clubs.

Entry forms to the Club secretary must be filled in and returned to the Club secretary not later than Thursday, April 11th.

The competing vehicles will assemble at Sheen House Club Yard not later than 2.20 p.m. on Saturday, April 13th. The route will be by the Sheen House entrance of Richmond Park to Robin Hood Gate, and (still keeping in the park) to Kingston Gate to Kingston (4½ miles), Esher (8½ miles), Cobham (11½ miles). At the top of the hill after Cobham (Pain's Hill, under suspension foot-bridge) proceed straight on and take first turn to the right on the Weybridge Road. At fork, 1½ miles farther, take right hand road for Hersham (16½ miles). Turn to right for Esher (18½ miles). Turn left for Kingston (22½ miles); over Kingston Hill by High Road for 4½ miles, then turn left down Roehampton Lane. Then to left along Richmond Road and to left to Sheen House Club (30 miles).

The drivers of vehicles on arrival at Sheen House Club will, under the supervision of their observer, be required to fill to the utmost extent the running spirit tanks of their cars. On the return of a vehicle to Sheen House, the running tank will be refilled with petroleum spirit under the directions of the committee and the immediate supervision of the observer. The amount of spirit required to refill the running tank will represent the consumption of spirit during the trial. A seat must be placed at the disposal of the Committee for the carrying of an observer on each vehicle. Vehicles having no seat in addition to that of the driver will, therefore, not be eligible for this competition. Drivers of vehicles must see that all seats in their vehicles are occupied by passengers having an average weight of not less than 10½ stones each. Drivers of vehicles entered for the trial will be required to take observers on board at the Club before proceeding to Sheen House Club.

Observers on cars will be charged not only with seeing that petroleum spirit tanks are not replenished during the run, but also with taking notes of the times of arrival at various points, and duration of stoppages and their causes. If the total running-time of a vehicle after deducting stoppages exceeds four hours, the vehicle will be disqualified. The passing of one competing vehicle by another whilst both are descending gradients or within towns or villages is prohibited, and the vehicle of any driver who may break this regulation may be disqualified. The usual regulation as regards speed in towns, villages, etc., will be in force.

THE success of M. Serpollet on his 12 h.p. steam-car has been much commented upon. The intrepid *chauffeur*, whose average speed for the race works out at about 44 miles per hour, was accompanied throughout the race by his wife.

THE United Motor Industries, Limited, of 40, Holborn Viaduct, E.C., have just issued a supplementary price list. It contains 48 pages, and all the goods referred to in it are new. We understand that this supplementary list will be sent free on application.

THE ever-active Mr. E. Shrapnell Smith gave a lecture on Automobilmism up-to-date at the Technical Schools, Bolton, on Wednesday night. On Friday, the 29th inst., he was to lecture on the subject of Heavy Motor Vehicles, to the Engineering Society of the Technical Institute, Coventry.

LAST year in Germany there were altogether twenty-five automobile races, the most important being the one from Mannheim to Pforzheim and back, in which there were twenty-four competitors. There are in Germany altogether thirty automobile clubs, all affiliated with the Automobile Union.

HERE AND THERE.

THE Automobile Club will, on Tuesday next, the 2nd April, hold its quarterly 100 mile non-stop trial.

THE question of establishing a motor-racing track at Koekelberg, near Brussels, is at present under consideration.

It is stated that an American company is now building fifteen special 18 h.p. petrol car vehicles of the Panhard-Levasor type.

THE Brighton Cyclist Club is organising a race meeting to be held at Preston Park on Easter Monday, April 8. Included in the events is a five-mile motor-tricycle handicap.

THE first motor-car, a steam vehicle, to appear in Armagh district is one owned by Mr. Jos. Atkinson, secretary of the County Council.

WE learn that Mr. F. H. Clingoe has resigned his position with Messrs. Friswell to take up an appointment with the General Automobile Agency, 100-104, Long Acre, W.C.

THE Hampstead Works Committee have decided to recommend the Council to spend £1,500 in the purchase of motor-vans for street cleaning and watering purposes.

WE understand that a company is being formed for the purpose of introducing a public service of motor-cars in Scarborough. The company will commence with three cars, and it is expected that these will be ready before the end of July. The cars will be constructed on the plan of char-a-bancs, with accommodation for twelve passengers.

THE Annual Motor Cycle Meeting of the Automobile Club will be held in July. The events will be as follows:—(a) One Hour Scratch Race for the *Autocar* Challenge Cup, open to any motor-tricycle; (b) Five Miles Scratch Race for the *Motor-Car Journal* Challenge Cup, for motor-tricycles with engines of 2½ h.p.; (c) Ten Miles Handicap for the *Automotor Journal* Challenge Cup, for motor-tricycles of not more than 2½ h.p.; (d) Three Miles Club Handicap, for motor-bicycles only.

THE British Automobile Commercial Syndicate, Limited, whose formation we announced in a recent issue, will shortly open a large dépôt at 97 and 98, Long Acre, W.C. The building consists of four large floors and is well adapted for the service. At a recent meeting of the company, the following were elected as directors:—The Rt. Hon. Earl of Shrewsbury and Talbot (chairman), M. Chabert, president of the Société Commerciale d'Automobiles, Paris, and Mr. D. M. Weigel (managing director).

ON calling at the dépôt of the Sports Motor Car Company, 103, Fulham Road, S.W., one day last week, Mr. Capellen showed us an example of the latest type of Mayfair Voiturette. It is fitted with 4½ h.p. De Dion Bouton or 5 h.p. Sports motor, and has a starting handle from the seat, lubricator to crank chamber, etc. A large water tank is placed under seat, the capacity being sufficient for a run of 120 miles, while the petrol tank capacity will suffice for 100 miles. The frame of the car has been considerably strengthened.

THE Hon. Secretary of the Reading Automobile Club has written to the local papers stating that arrangements can generally be made between Club members owning cars and those owning restive horses, with a view to familiarising timid animals with the modern means of transit. The offer is made solely with the idea of expressing the desire of the Reading Club to act with as much courtesy as possible to all fellow travellers on the King's highway, and we trust will be appreciated by horse owners accordingly.

A "SINGER" motor-bicycle and a tricycle of the same make were ridden from Coventry to London and back on Friday of last week, by Messrs. Duret and Perks. No attempt at record breaking was made, the riders contenting themselves with a steady average. They turned at Highgate Archway, and the total time for the journey, 176 miles, was 17h. 59m. The riding time was much less, as nearly six hours were occupied in calling on agents and in attending to the requirements of the inner man, which the motor-cyclists found indispensable to keep up their temperature in the keen air which prevailed during the ride. We may add that, with the exception of a little misfiring on the bicycle, no trouble was experienced.

THE CORNU VARIABLE-STROKE PETROL MOTOR.

ONE of the novelties at the recent motor-car exhibition in Paris was the variable-stroke petrol motor shown by Messrs. Royer and Cornu, of Rue St. Pierre, Caen, and of which we are now able to give illustrations. The motor consists essentially of an ordinary cylinder with its piston, valves, etc., etc., and of a rocking lever, A, which is pivoted about the shaft, Z, and is caused to rock backwards and forwards by the piston, M, through the connecting rod, U. It will be seen that a second connecting rod, K, transmits the power from the lever, A, to the crank-shaft, D, and that the position of the

FIG. 1.—THE CORNU VARIABLE-STROKE MOTOR.

rod, K, relatively to the lever, A, can be varied by means of the moving block, B, in the lever, A. The object of this device is to vary the stroke of the piston, M, according to the power required, and this, it will be seen, is effected by causing the slide, B, to approach or recede from the shaft, Z. A feed screw carries the block, B, and this screw terminates in two ratchet wheels, R, which are free to turn near the shaft, Z, in the slot, E. These ratchet wheels can be caused to rotate by allowing one of two pawls, H, to engage with its corresponding wheel as the lever, A, rocks to and fro; in this way the block, B, can be moved up or down to increase

FIG. 2.—DIAGRAM OF STROKE-VARYING ARRANGEMENT.

or decrease the stroke of the piston, M. In the motor built the range of stroke varies from 8 to 24 centimetres. The position of the two fixed points, D and Z, relative to the cylinder has been designed so that the rod, K, in lowering, that is to say, in increasing the stroke of the piston, describes an arc of a circle and draws the piston from the bottom of the cylinder to the dead point, the result being that the compression chamber is

always proportional to the stroke and to the quantity of gas drawn in on the suction stroke. The makers claim that their variable-stroke motor entirely obviates the use of mechanical speed change gear, which they estimate absorbs 30 per cent. of the power of ordinary petrol engines. Another great advantage claimed for it is that the system adopted permits the engine to draw in the exact quantity of explosive mixture desired to get the full power at any speed. We understand that Messrs. Royer and Cornu are open to negotiate for the sale of their British patents.

OBSTRUCTION BY MOTOR-CAR.

At the Birmingham Police Court last week Mr. F. Lanchester was charged with obstruction in the street. Police-constable Taylor stated that on March 10th he saw a motor-car standing outside Lincoln's Inn, Corporation Street, at 6.50. A large crowd collected, and a tram pulled up, the driver stating that he could not get past. No one came to the car till 7.10, when defendant came out of the Chambers. Witness told him the car had caused an obstruction, and asked for his card. This defendant produced, and gave it to the officer, together with a shilling, which, however, he declined to receive. For the defence it was contended that the car itself caused no obstruction, but if there was an obstruction it was caused by the crowd, and that defendant was not responsible for this. Defendant himself gave evidence, stating that when he left the car at 6.50, and when he came out again at 7.5, there was no crowd near. In reply to the Stipendiary, he admitted offering the officer 1s., but he

going at a greater rate than eight miles an hour. It was a car made for two, and there were five persons on it, so that a furious speed was impossible. He was canvassing and picking up voters in the interest of Mr. Mark Mayhew, one of the candidates. The Magistrate: The poll closed at eight? The Defendant: Yes, but we had plenty of time. Another witness having been called, the magistrate observed that the defendant's conduct of the case showed the wisdom of the old saying that a shoemaker should stick to his last. He might be very skilful in driving a motor-car, but he should have refrained from trying his skill at advocacy, for the very answers elicited by him from his own witness corroborated the police-constable's evidence. The facts were plain; there was an exciting election, the close of the poll was at hand, and the car careered down the road like a fire-engine. He fined the defendant 40s., with 2s. costs.

At Hereford last week Mr. F. Rough was summoned for driving a motor-cycle at a greater speed than fourteen miles an hour in Whitecross Road. Several competent witnesses said defendant was travelling about twenty miles an hour. Defendant told the Bench that he had since tested the machine, and found that it was impossible for it to go at the rate mentioned. If he could conscientiously think he was going at an excessive pace he would have acknowledged it and apologised. The Chairman told defendant that he was an experienced man and ought to know better. They would inflict a fine of £2 and costs 13s. 6d., but they would be inclined to inflict the maximum penalty of £10 if he came there again on a similar summons. Mr. Rough in sending us a cutting from a local paper adds sarcastically, "Cycle is for sale—too good for me."

A NEW motor-car depôt is being opened in Mortimer Street, London, W.C.

THE Creek Street Engineering Company, of Deptford, S.E., have taken up the manufacture of the Capel car illustrated in our issue of July 21st last.

AN hotel-keeper on the Ripley Road had a notice on the front folding doors of his establishment last week to the following effect:—"Slam the door; there's someone ill here." Somewhat pertinent our readers will think, and perhaps many may be of opinion also "a trifle rude."

THE programme for the English Motor Club's motor meeting at the Crystal Palace, on Easter Monday, is a varied one, and will consist of the following events:—Five miles scratch motor-tricycle race; two miles motor-tricycle handicap; ordinary voiturette race running in two heats, two in each heat; pursuit race between two De Dion-Bouton racing spiders, 10 h.p.; attempt on the one mile record from flying start; one mile roadster tricycle handicap and a match between two steam cars. Members of the club who desire to compete and who have not yet entered, should communicate at once with the hon. secretary.

AN interesting demonstration of the first Diesel engine made in England took place on Monday, at Guide Bridge, near Manchester. The motive power of this engine is crude petroleum, or any practical inflammable oil or gas, gradually introduced into an excess of compressed air. The heat of the compressed air causes slow combustion, not explosion, without any material increase of temperature, the heat being turned into work. It is claimed for the Diesel motor that there is an all-round economy of fuel, and that it works at half-load with only a slight increase over the proportionate cost of working at full load. Several indicator diagrams were taken during the course of the afternoon, and were regarded by experts present as being of a highly satisfactory character. The Diesel Motor Company state that the engine has been used for automobile purposes on the Continent, and they expect to enhance the popularity of this form of locomotion by the application of the engine.

THE GENERAL AUTOMOBILE AGENCY'S GARAGE IN LONG ACRE, W.C.

said he did this because of the trouble he had been put to. It was not with the intention of bribing him, and had he thought he would have been summoned he would not have done it. The Stipendiary said he believed every word the police had said, and he thought they had given their evidence most fairly. It was clear there had been obstruction, and he imposed a fine of 10s. and costs.

FURIOUS DRIVING CASES.

AT the South-Western Police Court last week Mr. A. Ellis, of Tooting, was summoned, for that he did drive a motor-tricycle on the High Street, Tooting, furiously on March 13th. Police Constable McKenna stated he was unable to catch the defendant, who was travelling at the rate of eighteen miles an hour. Witness had cautioned defendant in January last. Defendant denied having driven furiously, and stated he had been driving a motor for years, and had always kept within the speed limit. The magistrate, however, convicted, imposing a fine of 10s. and costs.

AT the South West London Police Court last week Mr. R. Moffatt Ford, managing director of the Motor Car Company, was summoned at the instance of the police for driving a motor-car along Streatham Hill at a furious rate on the evening of the 2nd inst.—Two police-constables swore that they saw the defendant drive the car past Streatham Hill Station at the rate of sixteen miles an hour. He was driving some voters to the polling station in Christchurch Road, and on his return they stopped him and took his name and address. As the car sped along the occupants shouted out "Hi! hi!" to the people in the road. The defendant went into the witness-box and denied on oath that the car was

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, APRIL 6, 1901.

[No. 109.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AS mentioned in our last issue, the members of the Automobile Club were invited by the Hon. John Scott Montagu, M.P., Vice-Chairman of the Club, to drive to and take tea at his residence, Ditton, near Datchet, on Saturday last, on the occasion of a meeting of the Eton Beagles. Forty members accepted the invitation, but unfortunately the weather was extremely bad, especially during the earlier part of the day, thus preventing many of those who had promised from turning out. Mr. and Mrs. Carl Meyer drove down on their 12 h.p. Panhard; Mr. Richardson, with Mrs. Richardson and friend, drove a 6 h.p. Daimler; Lord and Lady Edward Churchill and friend arrived on a four-seated Locomobile; Mr. T. B. Browne, with Mr. Martineau and Mr. Loeffler, drove his 6 h.p. Panhard; Mr. Heyermans and Mr. Harrington Moore were on an 8 h.p. Panhard, Mr. Cecil Edge on a 6 h.p. Gladiator voiturette, Mr. S. F. Edge and Mr. C. Jarrott were on a 5 h.p. Panhard light carriage, and Mr. Bruce and Mr. Johnson (the secretary) on a Darracq. Mr. Montagu and Lady Cecil Montagu did all they could for the comfort and enjoyment of their guests. At about 6 o'clock the majority of the party drove to Windsor and took dinner there at the Castle Hotel. The drive home at night was extremely pleasant.

Identification of Motor-cars.

MR. JOHN ROLFE, of Beaconsfield, writes to the *Daily Telegraph* stating, "On Thursday last week a motor-car came from Beaconsfield and rushed towards Wycombe past my house at the rate of about seventeen miles per hour. My retriever, a valuable dog, ran from the house into the road, and before he could get out of the way the car went over him, nearly killing him." Not being able to trace the driver of the car, Mr. Rolfe asks, "Would it not be possible to compel all motors to carry some conspicuous number so that they might be recognised in cases where they had done some damage? If it had been a human being instead of a dog that was run over the failure of identification would have been the same."

The Other Side of the Case.

THE other side of the case is put forward by Mr. Frank H. Butler and two other motorists in Wednesday's *Telegraph*. Mr. Butler points out that "In France anyone who allows his dog to pursue a cyclist or motorist and does not restrain the animal is liable by the penal code to a fine of from six to ten francs. Several valuable lives have been lost through cycles and motors skidding over dogs which were not under proper control. To get clear of a dog often means upsetting the vehicle and killing yourself instead of the dog." A military correspondent also writes that last summer he was driving a motor between Southsea and Chichester at, fortunately, about eight miles an hour. Two large retrievers lying on the footpath suddenly got up and charged at the car. One got in between the wheel and the spring, tearing the steering-handle out of his hand, which was strained and cut. The car turned right round, and if the

road had been narrower the party must have upset in the ditch. This correspondent adds, "It seems to me this is very like what happened in Mr. Rolfe's case, and goes to prove it is dogs allowed to stray on the high road that should be numbered. In what better position would Mr. Rolfe have been if it had been a dog-cart with a trotting horse going seventeen miles an hour? Some people want motors numbered, others carriages and horses; I say retriever dogs, and there are probably more would go for perambulators and cats, but the law as it is is quite strong enough to punish anyone who commits an injury through carelessness without attending to all these fads."

Municipal Motor-Cars.

AT the London County Council meeting, on Tuesday, Mr. Benn, chairman of the Highways Committee, in answer to a question, said something might be done in the direction of a municipal motor-car service, and the Committee had recognised the importance of the subject by electing as a member Mr. Mark Mayhew, who was a recognised expert on this modern means of locomotion. The Committee, however, did not, he thought, consider Mr. Balfour's idea of radiating thoroughfares a practicable one.

The Automobile Club's 100-Mile Trial.

ONLY two cars underwent the 100-Mile Non-Stop Trial of the Automobile Club on Tuesday—a 6 h.p. Gladiator car, driven by Mr. Cecil Edge, and a Marshall 6 h.p. dog-cart. The starting-point was the milestone on Notting Hill, two miles from the Marble Arch, and the turning point was the fifty-second milestone, two miles short of Oxford. After making a good non-stop run for eighty miles, the Marshall was suddenly thrown out of the running by the unusual accident of a broken crank-shaft, owing to a flaw in the metal. The Gladiator made an excellent run over the whole course, with only one short stop.

Motors in Orkney and Shetland.

FOR districts which are badly served or not served at all with railways the advantages of the horseless carriage are very great. Although this is admitted by all who are interested in self-propelled traffic, "outsiders" are slow to grasp the more pleasing, therefore, to learn that a movement is on foot in the far north to take advantage of the new method of locomotion for business as well as pleasure purposes by inaugurating a motor service in Orkney from Kirkwall to Stromness, a distance of fourteen miles. During the tourist season the traffic between the two places is very heavy. The attractions of Maeshowe and the Standing Stones of Stennes and the Loch of Harray, the happy hunting grounds of the disciples of Izaak Walton, are largely responsible for this. Whether the introduction of the motor-car will prove a success or not remains to be seen, but at any rate the experiment will be watched with interest by all followers of the automobile. So much depends upon how these running companies are managed that it is difficult to forecast regarding the successful working or otherwise of the scheme. One thing is certain—unless

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

punctuality in running be strictly observed the public very soon begin to "kick." To ensure promptness of start and arrival, two or three spare cars, more or less, according to the fleet to be engaged in the service, are an absolute necessity, for one never knows the minute when some small matter (trifling in itself maybe, but these trifles take time sometimes to "spot") may result in a car refusing to move, and one must have another ready to take its place almost instantaneously. We know those who have had considerable experience in the management of running companies and the *bête noire* which they had to contend against was unpunctuality, caused in most cases through not having spare cars ready to take up runs—at a moment's notice—in the event of the breakdown of the regular car.

The Steam-Car as a Racer.

THE performances of the Serpollet steam-car in the various contests at Nice put the prospects of steam in a much more favourable light than ever before. M. Serpollet won the tourists' race of 84 miles at an average speed of about 31 miles an hour. By gearing up his car tremendously M. Serpollet also made the fastest time in his class in the flying kilomètre contest, travelling at a speed equal to 66 miles an hour. In the hill-climbing race the steam-car was less prominent, the time, 24 min. 11 3-5 sec., being considerably inferior to that of the petrol-driven cars. None the less, the merits of steam have been very strikingly displayed. It may be of interest to mention here that the right to manufacture and sell the Gardner-

STARTING FOR AN EASTER TOUR.

Serpollet steam-cars in the British Empire has been acquired by the British Power-Traction and Lighting Company, of York, who are arranging for a large output of 6, 9, and 12 h.p. cars.

A Big Race in America.

As a result of a conference held in Buffalo between the Director-General of the Pan-American Exposition, and a committee appointed by the Board of Governors of the Automobile Club of America, it has been decided to hold a grand international road race of 200 miles, from Buffalo to Erie and return, as the culmination of a week of automobile sports at the Pan-American Exposition. The sports and contest will take place during the week beginning September 16. It is intended that the international race shall rank with the famous long-distance automobile races of the world—large purses and valuable cups and medals will be presented to the winners.

Another End to End Trip.

WE referred in a recent issue to the trip from John o' Groat's to Land's End lately undertaken by Mr. W. R. Warren Smith in a motor-vehicle. The chief merit of his performance is that it was made in wintry weather and under most disadvantageous conditions, for some of the roads, especially in Perthshire and Inverness-shire, were so blocked with snow that

a road had to be cut for a mail cart which immediately preceded the motor-car. The negotiation of the ascent of the Ord of Caithness and the formidable Shap Fells in Westmoreland put the vehicle to the severest trials, but after the heavy country was left behind good progress was made, notably one run of 160 miles from the north of Shrewsbury to Bristol in the day. Mr. Warren Smith accomplished the journey on an Argyll voiturette of 5 h.p., weighing only 4½ cwt. The ride was performed in easy time without any attempt at record breaking, the cost of the petrol consumed being £3 5s., and Mr. Smith estimates, taking into account certain detours which he made, that he covered just over one thousand miles. The only mishap experienced was the breaking of the piston when three miles west of Penzance. The identical car is now on view at the Hozier Company's London dépôt in Baker Street, W.

The Glasgow Exhibition Trials.

At a meeting of the Committee of the Scottish Automobile Club, held in Edinburgh a few days ago, the proposed Glasgow trials were fully discussed, and the members present decided that it was necessary to have a committee of gentlemen residing in Glasgow and vicinity to confer with the Glasgow Exhibition authorities in the arrangement of these trials. A committee was therefore appointed, with Mr. R. J. Smith, C.A., 59, St. Vincent Street, Glasgow, as chairman.

A Word of Caution.

IN a recent issue the *Horseless Age* sounds a useful note of warning which may well be repeated here. Our contemporary remarks that quite a number of serious accidents have occurred of late which may be ascribed to what might be termed repaired patchwork. A car altogether too light in its original construction has been time and again strengthened and repaired by its owner. Parts that proved too light have been replaced by heavier metal, until the total weight of the vehicle has been raised one or two hundred pounds. Some of the crucial parts, however, like wheels and axles, have remained unchanged, and in consequence are carrying additional weight when their original load was far beyond the factor of safety. The overworked metal gives way under some unusual strain, and a dangerous spill is the result. A motor-car of too light design for durability and safety cannot be rendered safe and durable by patching. Unless great care is used in handling it and only moderate speeds are indulged in it will fail at some critical moment as certain as there are laws that govern the strength of materials and the strains to which these are subjected in road work.

How Long a Motor Lasts.

THE question of the "life" of the engine of a motor-car is discussed by M. F. Gaillardet in a recent issue of *La Locomotion Automobile*. M. Gaillardet compares the motor to the human heart, each having a limited number of revolutions or pulsations to perform during its busy existence. The more rapidly the motor works or the heart beats the sooner it will wear out. A one-horse motor running at 2,400 revolutions per minute will, therefore, last half as long as a motor of the same force and of 1,200 revolutions. Accordingly, M. Gaillardet is opposed to the application to "voiturettes" of high-speed motors—that is to say, motor-cycle motors, which are made to give a maximum of force with a minimum of weight, which implies the necessity of high speed. This fault in the motor-cycle was partly corrected by means of the lightness of the "ensemble," which made it possible to obtain sufficient speed on the road without making use of the full power of the motor. "But," says M. Gaillardet, "in the 'voiturette,' by means of the speed-changing mechanism, one can utilise without mercy the maximum of the power developed. This power, given the weight of the entire outfit, is not so great that one can think of economising it, and, in fact, it is never economised."

Electric v. Incandescent Tube Ignition.

IN the modern racing machine of twenty and more horse power—the incandescent tube has been superseded by electric ignition, although for other reasons than that of safety. In racing machines everything which increases the effective power of the motor is of the highest value. The motors of racing vehicles naturally have a high normal speed and a variable ignition is therefore an essential feature of such motors. Thus it has been found that in races a higher average power can be obtained from a motor when fitted with electric ignition than when using an incandescent tube, and electric ignition has now been sufficiently developed so that when handled by expert motorists, such as race contestants naturally are, it is found unnecessary to supplement it by tube ignition, as was done when the change from tube to electric ignition was first made in such machines.

The Carlsbad Automobile Week.

FOLLOWING the example of the Automobile Club of Nice the Austrian Automobile Club intends to organise an "automobile week" in Carlsbad. If the negotiations at present going on are successfully concluded the meeting will take place at the end of July or the beginning of August in that international watering-place. For the moment the following programme is put forward:—First day, automobile flower *corso*; second day, race for racing machines, starting from Carlsbad; third day, race for touring machines; fourth day, hill-climbing contest; and fifth day, automobile festival and distribution of prizes.

Automobile Racing in Russia.

THE St. Petersburg Automobile Club held its annual race on the 17th ult. It had been postponed once because a heavy fall of snow rendered progress impossible. On this occasion the snow was thawing, which made matters almost as bad. The race was, as on two previous occasions, over the 65-verst triangle formed by the Volkoff, Gachina and Krasnoe-Selo high-roads, starting and finishing from Alexandrovskoe. The following started:—Motor-cyclists: Messrs. Alexeieff, Sourmetz, and Kroupsky; voiturettes: Messrs. Barbet and Mikhayloff; and cars: Messrs. Henrick and P. Orlovsky. From start to finish the race was a chapter of accidents. Skidding, waltzing, and plunging into snow drifts, the competitors were unable to make any great speed. Sourmetz on his motor-cycle was the only one who finished within the time limit of four hours. He took 3h. 58min. to cover the sixty-five versts.

The Stirling Voiturette.

"FOR some time past I have," writes our Scottish correspondent, "had the promise of a trial of one of these smart little carriages, but until last week I was not able to avail myself of it, chiefly on account of the weather, which was not at all comfortable. Last week, however, I had an opportunity of closely scrutinising the details of this voiturette and of experiencing a fifteen miles spin thereon. The car submitted for my inspection and trial was one of the maker's Standard No. 1, a front driver and rear steerer. The side steering "tiller," similar to that used on the "Locomobile," has been adopted in place of the centre tiller first introduced, the object being to give a "free" foot board. This was my first experience of front driving and steering by the rear wheels, and I was much interested to witness the effect of the same in comparison with the usual practice of front steering. I was agreeably surprised at the result. In hill-climbing there was a very marked improvement over the rear-driver, and so far as the "driving" is concerned I had ample confirmation of what most engineers are agreed upon, viz., that the front wheels ought to be the "drivers." The important matter of steering, however, has also to be considered in motor-car construction, and a good deal of prejudice exists, in this country at least, against rear-steering, I myself sharing the prejudice. After

my ride on the Stirling voiturette I must admit that if my prejudice was not destroyed it was certainly greatly diminished, and I dismounted from the car with an inward feeling that the last word had not been said on this subject, and a strong inclination to believe that the question of preference for front or rear steering was largely a matter of habit, assuming, of course, that the steering apparatus was properly designed, as it appeared to be on the Stirling voiturette. I was much pleased with the running qualities of the car as well as its substantial and businesslike appearance. For the benefit of people preferring front steering Messrs. Stirling have their No. 2 voiturette in this form, a batch of which I saw coming through the works on the day I visited Hamilton, several of them being fitted with *tonneau* bodies."

The Position of the Coachbuilder.

WITH reference to our Comment on this subject in our last issue, the following extract from an article in the last issue of the *Carriage Builders' Journal* is not without interest:—"The feeling, arising from many causes, is growing gradually stronger that for many purposes for which carriages and horses are used to-day, motor-cars will take their place before long. Carriage builders are not so suspicious and doubtful as they were, say, a couple of years ago, and it is to be hoped that they will, in their own interests, wake up to the immense possibilities there are in the development of the motor. Our ideas of what a carriage should be may not be possible with some styles of motor-frames at present in favour, but are carriage builders quite sure that their ideas in this respect are infallible? Is it not possible that the tastes and requirements of the carriage user may vary, and that there may arise a fashion which is not the present style of carriage, the designing, building, and finishing of which may pass as effectually out of the hands of the carriage builder as did the building of railway carriages?"

IF IT WERE POSSIBLE!

The A.C.F. Carburant Competition.

A SERIES of tests of carburating agents is being organised by the Automobile Club of France for the 1st May and following days. The carburants to be subjected to test will be those manufactured for use in explosion motors, all experiments being made in comparison with a special spirit of the specific gravity of 700 at a temperature of 15 deg. Cent., and with motors of various types, viz., high-speed motors with short stroke, 3.12 in. cylinder diameter, 3.12 in. stroke, 1,300 to 1,600 revolutions per minute; motors running at mean speed with mean stroke, 3.12 in. bore, 4.68 in. stroke, 850 revolutions per minute; and slow-speed motors long stroke, 4.29 in. bore, 6.24 in. stroke, 650 revolutions per minute. The experiments to be carried out will bear upon the consumption of the carburant per horse-power per hour taken off the crankshaft at various speeds. To this end the consumption per horse-power per hour taken off the shaft at various speeds will be noted, both for the standard and the tested carburant, etc., under the best possible conditions of carburation, advanced ignition, cooling, lubrication,

etc. After a continuous run of ten hours with each carburant, the motor will remain untouched for the night, and afterwards careful note will be taken of the condition of the valves, cylinder walls, exhaust pipe, etc., before same are cleaned. Competitors who have specially designed carburettors for use with their particular carburant may have them tested with their carburant. The fact that any carburant is not purchasable will not bar it from the tests, but the fact that it cannot be generally bought will be noted in the report.

Accumulator Charging at Chester.

At a recent meeting of the Chester Town Council an interesting question cropped up, viz., that of the charges to be made in connection with the charging of the accumulators of electrical vehicles at the Corporation electric light station. Mr. Thursfield, the Corporation electrical engineer, reported that he occasionally catered for the convenience of tourists passing through the city by charging their accumulators, and asked the Council to state a rate at which the necessary current might be supplied. It was resolved that the charges be as follows:—6d. per unit, with a minimum charge of 2s. to cover cost of supervision; exceeding twenty units, 3d. per unit. These charges seem reasonable enough, and are worthy of imitation on the part of other provincial centres.

Another Automobile Gun Carriage.

IN our issue of October 6, 1899, we illustrated a motor gun carriage, which Major R. P. Davidson, of the U.S. North-Western Military Academy at Highland Park, Ill., had had built, and with which he made some experiments between that place and New York. Owing principally to tire troubles the trials were not successful. We now learn that Major Davidson has decided to construct, in the manual training shops at the Academy, two entirely new carriages, using steam as the motive power. He expects to start with these two carriages in June for Washington, taking the southern route through Indianapolis, Columbus, and over the mountains. After giving exhibitions before the U.S. War Department at Washington, he will go north through Baltimore, Philadelphia, and New York to Buffalo, spending a week or ten days giving exhibitions there at the Exposition, and from there back to Chicago, making in all between 2,000 and 3,000 miles' run over roads of all conditions.

Heavy Motor-Vehicles.

IN the series of lectures which have been given to members of the Coventry Technical Institute Engineering Society during the present session, the subject of motors and motor-vehicles has engaged a largeshare of attention. On Friday evening last week the members had brought to their attention some facts regarding "Heavy Motor-Vehicles." The lecturer was Mr. E. Shrapnell Smith, the hon. sec. of the Liverpool Heavy Propelled Traffic Association. He commenced by remarking that in Liverpool they laboured under the impression that they were badly treated by the railway companies. They were not alone in that, for other parts of the country seemed to think the same. Consequently they had devoted the last five years to endeavouring to find out whether self-propelled vehicles would convey goods for, say, distances of from twenty to forty miles more economically than did the railway companies. Passing on to speak of the nature of the problem which had to be faced, Mr. Smith pointed out the fundamental fact of the very considerable amount of power necessary to deal with loads upon common roads, especially when they had to ascend gradients. Dealing with the question of tires, he said experience had taught them that in putting these on hydraulic pressure had to be utilised. After giving some lantern views of the Liverpool trials, Mr. Smith dealt exhaustively with the question of boilers and burners. The lecture was of a most practical nature, and after its delivery there was a discussion in which several gentlemen took part. Replying to the points raised, Mr. Smith estimated the total cost of working a motor wagon to

carry four tons at 27s. 6d. per day, and there was no doubt that, at any rate in Lancashire, they would be able by motor-propelled vehicles to beat the railway companies in regard to cost of conveyance.

Plain Facts about the Automobile.

THIS is the title of a little pamphlet we have received from the Nature Study Press, of Manchester, N.H., U.S.A. It is from the pen of Mr. Albert L. Clough, and has for sub-title: A Popular Description of the Several Systems and Suggestions for Prospective Users. This sub-title clearly specifies the scope of the little work, which is written in a clear style, devoid of technicalities, and enumerates all the advantages and disadvantages of the three propulsive systems now in vogue in an impartial spirit. The special adaptations of each system are pointed out. A special chapter gives suggestions as to the selection of a motor-car. The care and housing of automobiles are also dealt with, and in the concluding chapter the author points out the advantages of motor-cars as compared with horse vehicles.

Motor-Cars for Municipal Purposes.

As we announced in a recent issue, the Beckenham District Council lately invited tenders for the supply of motor dust carts. On the opening of the tenders last week it was found that the following offers had been sent in:—Thornycroft Steam Waggon Company, £700; Bailey's, Limited, £700; Lancashire Motor Company, £555; and the Creek Street Engineering Company, £500. No orders were placed, but a Committee was appointed to inspect the cars manufactured by the Lancashire Motor Company and the Thornycroft Steam Waggon Company referred to in their respective tenders.

Motor-Car Driving Schools.

WE have already referred in these columns to the opening that exists for "motor schools," and as progress in that direction does not seem to be very rapid, we would draw the attention to all those interested in the advancement of the motor industry to the fact that the lack of knowledge and familiarity with motors is a great barrier to the use of automobiles. Every cycle manufacturer and agent knows that cycle riding schools brought them a very large proportion of their customers in the early days. Even so motor schools will make customers for motor cycles and cars. Another point is that if purchasers go through a regular course of tuition they will get more satisfaction and service out of their vehicles, which, of course, is an important consideration to both maker and dealer. For these reasons makers should lend their aid and influence to the establishing of motor schools.

THE Locomobile Company of America has sent us a copy of a new leaflet they have just got out showing the Locomobile in use in Yosemite Park, Belgium, California, Mexico, and elsewhere.

ONLY seven out of nearly four hundred applicants for motor-vehicle licences in Chicago failed to answer the necessary questions correctly.

THE *Horseless Age* of New York has just published a most interesting special number devoted entirely to the use of motor-cars for business purposes. It should do much to advance the use of automobiles in this direction in America.

A SPEED contest for automobiles fitted with motors using alcohol as fuel is to be run off between Paris and Roubaix, a distance of 268 kilometres, on Easter Monday. The course is divided into five categories, ranging from heavy cars down to motor-cycles.

OF 378 licences to drive motor-vehicles through the streets which the municipal authorities of Chicago have granted, 226 are for electric vehicles, sixty for petrol, and nine for steam propelled vehicles. The remaining eighty-three permit their holders to use either steam or petrol.

THE NICE WEEK.

THE first event on Thursday of last week was the mile race, on the Promenade des Anglais. This race, together with the flying kilomètre course, which followed it, was confined to the competitors who took part in the speed race on the previous Monday. The following were the results:—

Class A—Motor-cycles.

	Mile Race.		Kilomètre Race.	
	Standing Start.	Flying Start.	Standing Start.	Flying Start.
	m.	s.	m.	s.
Osmont...	1	22 3-5	—	42 2-5
Demester	1	27	—	44 1-5
Bardin ..	1	30	—	44 3-5

Class B—Light Cars.

Edmond (14 h.p. Darracq) ...	1	32 1-5	—	48 4-5
Marcellin ...	1	37 3-5	—	52 4-5

Henri Farman did not start, for some reason or other; whether this will disqualify him remains to be seen.

Class C—Heavy Cars.

	Mile Race.		Kilomètre Race.	
	Standing Start.	Flying Start.	Standing Start.	Flying Start.
	m.	s.	m.	s.
Werner (Baron Henri de Rothschild's 35 h.p. German Daimler) ...	1	16 4-5	—	41 4-5
Lorraine-Barrow (35 h.p. Mercédès car) ...	1	17 2-5	—	42
Serpollet (12 h.p. steam-car) ...	1	17 4-5	—	38
Decaters (40 h.p. Mors) ...	1	24 3-5	—	45 3-5
Chauchard (28 h.p. Panhard)...	1	26 2-5	—	43 3-5
Degrais (40 h.p. Rochet-Schneider) ...	1	30 2-5	—	46 3-5
Ratishauer (12 h.p. Serpollet steam-car) ...	1	32 4-5	—	46 2-5
Schneider (40 h.p. Rochet-Schneider) ...	1	44	—	55 4-5
Bernard (12 h.p. Serpollet steam-car) ...	1	44 4-5	—	60 2-5

The Henri de Rothschild Cup Race was next run off. This was over a distance of one kilomètre, with flying start, the result being:—Serpollet, 35 4-5 sec.; Lorraine-Barrow, 42 3-5 sec.; Werner, 41 4-5 sec.; Sir Knapp (M. Thorn's 35 h.p. German Daimler), 42 4-5 sec.; Prince Lubecki (Stern), 41 4-5 sec.; Mercédès (Turner), 44 1-5 sec.; Chauchard, 43 4-5 sec.; Docteur Pascal, 44 1-5 sec.; Prince Lubecki, 51 3-5 sec.; Pinson, 51 1-5 sec.; and Collomb, 51 4-5 sec.

This event over, a special series—mile standing start and flying start kilomètre race—was inaugurated for the non-placed competitors in the courses on the previous Monday. Some fast times were set up, as will be seen from the following table:—

	Mile.		Kilomètre.	
	Standing Start.	Flying Start.	Standing Start.	Flying Start.
	m.	s.	m.	s.
Béconnais (Perfecta tricycle with Soncin Motor) ...	1	12	—	39 1-5
Lorraine-Barrow ...	1	12 3-5	—	42 2-5
Baras (14 h.p. Darracq) ...	1	15 2-5	—	44 3-5
Maugin... ..	1	38 3-5	—	54 3-5
De Rothschild ..	1	38 4-5	—	46 4-5
Serpollet (small car) ...	1	40	—	49 3-5
Oury (voiturette) ...	1	40 2-5	—	59 4-5
Bucquet (Werner bicycle) ...	1	56 3-5	1	8

The Nice-La Turbie race, a contest over a hilly course of 15½ kilomètres, formed the principal event on Friday, the 29th ult. The contest was divided into seven categories, viz.:—(A) Vehicles weighing less than 250 kilogrammes; (B) cars weighing between 250 and 400 kilogrammes, and carrying two persons; (C) cars weighing between 400 and 600 kilogrammes, and carrying four persons; (D) two-seated cars weighing more than 400 kilogrammes; (E) four-seated cars weighing between 400 and 1,000 kilogrammes; (F) six-seated cars weighing over 1,000 kilogrammes; and (G) steam and electric cars.

Series D was sent off first, at minute intervals, in the following order:—Chauchard, Lemaitre, Lorraine-Barrow, Werner,

De Caters, Pinson, Schneider, Degrais. Then came series G:—Ratishauer, Bernard, and Serpollet, all on Serpollet steam-cars. Series A followed, the starters being:—Portal, Béconnais, Gleizes, Bucquet (Werner motor-bicycle), Bardin, Osmont, Bensa, Demester, Cormier. The starters in series C, which came next, were:—Rudeaux, Cuchelet, Kreutler, Koechlin, Ravenez, and Cornilleau. Series E was next despatched, Barbereau, Katzenstein, Rigoullot, and Braun starting. Then came series F, with Sir Knapp (Thorn), Collomb, De Turckheim, and Durand. Series B was the last to be got away, the competitors being Baras, Marcellin, Farman, Edmond, Pietrasanta, Théry, Boyer, and Oury.

The route was lined with spectators, particularly at the Montée du Pin, where the grade is about 1 in 10. The results, according to the official classification, were as follows:—

Series A.—(1) Béconnais, 17 min. 21 sec.; (2) Gleizes, 18 min. 40 3-5 sec.; (3) Osmont, 19 min. 2 4-5 sec.; (4) Bardin, 20 min. 33 1-5 sec.; (5) Demester, 21 min. 56 3-5 sec.; (6) Bensa, 23 min. 27 1-5 sec.; (7) Bucquet, 27 min. 34 4-5 sec.; and (8) Portal, 34 min. 7 4-5 sec. Cormier did not finish.

Series B.—(1) Baras, 19 min. 40 2-5 sec.; (2) Edmond, 20 min. 38 1-5 sec.; (3) Boyer, 22 min. 37 4-5 sec.; (4) Oury, 30 min. 22 2-5 sec.; (5) Théry-Duanip, 33 min. 12 4-5 sec.; and (6) Ferber, 45 min. 38 1-5 sec.

Series C.—(1) Koechlin, 28 min. 35 4-5 sec.; (2) Rudeaux, 30 min. 10 sec.; (3) Ravenez, 41 min. 17 4-5 sec.; (4) Cuchelet, 45 min. 49 sec.; (5) Cornilleau, 1 hr. 7 min. 4 4-5 sec.

Series D.—(1) Werner (Mercédès), 18 min. 6 1-5 sec.; (2) Lemaitre (Mercédès) 18 min. 49 3-5 sec.; (3) Chauchard (Panhard) 19 min. 2-5 sec.; (4) Pinson (Panhard), 22 min. 4-5 sec.; (5) Degrais (Rochet-Schneider), 23 min. 19 1-5 sec.; (6) Schneider (Rochet-Schneider), 24 min. 44 1-5 sec.; (7) Lorraine-Barrow (Mercédès), 42 min. 45 1-5. De Caters did not finish.

Series E.—(1) Katzenstein, 28 min. 20 sec.; (2) Braun (Pinson), 33 min. 6 sec.; (3) Rigoullot, 35 min. 32 2-5 sec.

Series F.—(1) Sir Knapp, 21 min. 46 sec.; (2) Collomb, 28 min. 35 1-5 sec.; (3) De Turckheim, 30 min. 32 2-5 sec.; (4) Durand, 31 min. 37 3-5 sec.

Series G.—(1) Serpollet, 24 min. 11 3-5 sec.; (2) Ratishauer, 30 min. 54 1-5 sec.; (3) Bernard, 44 min. 40 2-5 sec.

Levegh's record of 19 min. 2 sec., established last year over this route, was thus lowered by Werner to 18 min. 6 sec. In the motor-cycle class Béconnais established a new record, 17 min. 21 sec., as against 20 min. 10 sec. by Gasté last year, while in the light car class Théry's 1900 record of 31 min. 21 sec. was lowered by Koechlin to 28 min. 35 sec.

A *concours d'elegance* took place in the afternoon at Monte Carlo, while in the evening there was a grand procession of decorated and illuminated cars.

On Sunday last the Coupe de Nice race was run off. The course was Nice-Cannes-Le Luc-Brignoles-Le Val-Carces-Lorgues, Draguignan-Frejus-Nice, a distance of 264 kilomètres. The Coupe de Nice is a challenge cup, and was held by the Nice Automobile Club, who selected Messrs. Chauchard, Pinson, and Stead to defend it against the challengers—the Moto-Club de Lyons, who chose Messrs. Schneider, Marge, and Collomb to represent them. At the starting point, however, only Messrs. Collomb, Chauchard, and Pinson turned up, the latter abandoning almost at the start. Little interest was shown in the race, which proved an easy victory for M. Chauchard, so that the cup still remains with the A.C.N.

A CYCLE and motor-car show opens at Lille, France, to-day, the 6th inst., and runs to the 21st inst.

AT the last meeting of the Westmoreland County Council a letter was read from the East Suffolk C.C. suggesting an amendment in the law relating to the speed of light locomotives, and the clerk said the effect of the proposed amendment was that motor-cars would be limited to ten miles an hour instead of twelve, and that there should be continuous and sufficient warning of approach. The letter was referred to the Main Roads Committee for consideration.

THE RENAUX LIGHT CAR.

WE are this week able to publish illustrations of the light car lately brought out by the Société L'Energiee of Paris, and which attracted so much attention at the recent Paris Automobile Exhibition. The vehicle is not a voiturette, but really a small car of very robust make and with a long wheel base, allowing plenty of room for four passengers, and not cramping them as in the ordinary voiturette. The frame, which is of tubular construction, is built low and carries the whole

FIG. 1.—GENERAL VIEW OF RENAUX LIGHT CAR.

of the motor and transmission gear, so that any type of body can be fitted, Fig. 1 showing a *tonneau*. The motor is a two-cylinder Buchet developing 8 h.p.; it is located under a bonnet in the fore part of the frame. The ignition is electrical and the cylinders are of course water-jacketed. A geared pump maintains the water circulation, in connection with which a radiating coil is fitted in the front of the bonnet. Three forward speeds and one reverse are provided, all controlled by one lever; the third

FIG. 2.—VIEW OF FRAME OF RENAUX LIGHT CAR.

speed is direct-acting, and by this means a considerable amount of loss by friction is avoided. There is the usual clutch between the engine and the intermediary shaft, but this clutch is worked in and out by means of a four-threaded screw, so that all jerk is avoided. From the change-speed gear box to the rear axle the motion is transmitted by a shaft with universal joints and bevel gearing. Steering is controlled by an inclined hand-wheel, while the road wheels are of wood, 31½ in. in diameter and shod with pneumatic tires. The weight of the car complete is about 9 cwt., and its width and long wheel base make it very stable. A speed of 34 miles per hour on the level has been attained by a car of this type, and its hill-climbing qualities are unrivalled—it holds the record of the famous hill of Gaillon, and has beaten all previous records by 16 seconds.

WE have received a copy of the Reading Automobile Club's Handbook for 1901, from which we learn that the Club will organise a non-stop run and hill-climbing contest during the coming summer.

CORRESPONDENCE.

MORE ROOM WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am anxious to obtain a motor-car to carry four, and have been to several of the dépôts, but so far have failed to find anything to suit my requirements. At present there seem to be principally three types—the large Daimler type, the voiturette and the Benz type. The first of these, owing to the heavy cost, is out of the question, except for the wealthy. Many of the voiturettes of about 5 h.p. appear very satisfactory except that the seating accommodation in the *tonneau* or other form of back seat is absurdly inadequate, in most cases only big enough to carry two children. Of the Benz class there are several which would carry four comfortably, but to my mind this type is open to serious objections.

Will not one of the many firms in this country now taking up the motor business give us a car with engine in front, gear driven, about 5 to 6 h.p., with comfortable accommodation for four passengers? The increased size of the body required could not increase the weight more than about 20 lbs., and such a car at from 200 to 250 guineas would probably find a ready market. Perhaps the greatest attraction of a motor-car is the possibility of going long distances, and for this purpose it is essential to have a seat of comfortable size with a fairly high back to it.—Yours truly,

C.

ACCUMULATOR AND DRY BATTERY PUZZLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following may interest some readers, who may be able to explain the variation of action in accumulators. I have two batteries, each 4 volts—call No. 1 and 2. On the first day, (car not run) No. 1 showed 4½ volts, and more ampères than the meter would give; No. 2 showed 4 volts, 6 ampères, both at separate times, connected up, and volts taken at terminals. On second day No. 1 showed 3½ volts, 12 ampères; on third day, 4½ volts, 3 ampères. Thinking this must arise from a short circuit I examined all wires, cleaned the terminals, and recharged cells; still I found the same variation occurred on different days, the battery not connected.

Then again I have a dry battery, which ought by now to be on the scrap heap, showing after runs of more than 1,000 miles, 2 volts, 3 to 4 ampères, and it still gives better or as good ignition as accumulators showing over 4 volts. I could understand it if the temperature had altered considerably, but in this case the mean is 40 F. Further, it has been my experience of dry cells that those charged in winter months last longer than those charged in summer. A dry battery charged in February is one alluded to here.

Is it not a pity that a universal thread is not used on all engines, or that the manufacturers do not make sets to supply purchasers of cars? I am quite willing to go to an expert when in real trouble, but it is annoying to send for one to put in a screw.

Yours truly,

AUGUSTUS KENT.

GEARS AND IGNITION FOR MOTOR-QUADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your issue of the 30th ult. that Mr. G. T. Taylor advises me to try a 22-tooth pinion wheel on my Allard quad. I was under the impression that you must reduce the number of teeth on the pinion, giving more revolutions to the motor engine, to obtain power for hill-climbing. I should be pleased if Mr. Taylor would explain how he obtains more power by doing this.—Yours truly,

CHUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Before "Chum" makes any alteration whatever to his quad, I should advise him to consult Mr. F. Cox, Swanley Junction, Kent. My Allard tricycle had the same complaint as "Chum's"

appears to have, but Mr. Cox made it mount the hills very much better and give a greater speed on the level without alteration to the gear. He tells me he would not answer the letter himself as it would appear as a sort of advertisement, and he also tells me that mine is not the first Allard he has improved.—Yours truly,
MAN OF KENT.

6 H.P. PANHARD CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of March 30th, that a correspondent signing himself "Phoenix" wishes for information as to 6 h.p. Panhard cars on the following points, i.e., (1) their wearing qualities; (2) how many miles gear will run without renewing; and (3) how long piston rings, chains, and sprockets last. Now, I do not wish to take up much of your valuable space, but as I am a private user, and have had in all eight cars and tricycles within two years, I can speak from good practical experience as to my last and best car, a so-called 6 h.p. Panhard, which I have used almost daily for nine months. I say "so-called 6 h.p.," because it gives off over 8 h.p., and is geared up to thirteen teeth on the chain sprockets.

The wearing qualities of the Panhard car are all that could be desired. The time the gear will last and the mileage that can be covered without renewing any part of it is easily answered. "It is the hand that manipulates the lever for changing the speeds that will be solely to blame if the gears wear out before many thousand miles have been covered." Care in driving tells the tale. I am having my Panhard overhauled, after using it since last June almost daily, and if your correspondent "Phoenix" is in London, and will communicate with me through your valuable journal, I will with pleasure take him to Mr. Wellington, 36, St. George's Square, Regent's Park, N.W. One look, and he will see the gears are as good as the day they were first fitted. My piston rings also have never been renewed, and the compression on my car is, as my mechanic remarks, tremendous—that speaks for itself.

I have had one new set of chains, and these should last a considerable time, provided they are taken off about every three weeks, and placed in molten Russian tallow and graphite mixed; this will keep the chains in splendid condition, and they require little or no lubrication. My sprockets are in perfect order. The distance I have travelled exceeds 9,000 miles.

Give care and proper attention to the car, also in driving, for in the latter especially lies the secret. And, lastly, treat the car as you would a valuable horse, and do not expect it to run for ever, and never on any account interfere with the engine, or grind in the valves, until they really shows signs of needing this. Mechanics are very fond of laying the car up for a day or two on the pretext that the valves must want doing, simply because they have not been done for some weeks, but now I always wait until I find by experience that they require it. My motto with regard to the motor itself is, "Leave well alone."—Yours truly,
JOHN D. HILL.

3½ H.P. ALLARD CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers oblige me with information of the 3½ h.p. Allard Rapid car as to the wearing qualities and of its engine power; whether it is a good reliable vehicle, and also the cost of running per mile?—Yours truly,

SECOND.

THE LOCOMOBILE STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if any of your readers can tell me how the "Locomobile" works in practice, and if there is any special trouble with either the boiler (furring) or the oil supply? What is the actual oil consumption on average roads per mile?

I am now wavering between a De Dion voiturette and a "steamer"; the one noisy, economical, and far-travelling; the

other silent, costly (I fear) in running, and requiring stoking every twenty-five miles—at least I presume so.—Yours truly,
"NOVICE."

MAIDENHEAD BRIDGE TOLLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to notice in your last issue that you refer to Mr. Taylor's agitation against the tolls levied on Maidenhead Bridge, which connects Berks and Bucks, and is on the main road to Bath. Believing Mr. Taylor will have the support of every user of a motor-car, I venture to ask for your influence in giving publicity to our object—that of freeing the King's highway.

This is a matter that affects all automobilists, as success in one instance should materially affect all tolls throughout the country. Mr. Taylor has taken up the case in a public-spirited manner, and will, if supported, carry it through. With a view to obtaining such support may I appeal through your columns to any motorist willing to assist? I shall be pleased to forward a copy of a pamphlet on the question drawn up by Mr. Taylor, and also to receive any offers of assistance.

Thanking you in anticipation for inserting this, yours faithfully,
Slough, Bucks.

J. FULLBROOK.

MR. C. P. COBB writes that in his letter published in last week's issue "without igniting the plates" should read "without injuring the plates."

A KILOMETRE race is to be run off on the 21st April, under the auspices of the Antwerp Automobile Club.

At the Moto-Club de Belgique in Brussels on Saturday last M. de Meuse, of the Pieper Company, gave an interesting address on "Carburettors and Methods of Ignition."

MR. GOULD, of Barry, South Wales, has decided not to run his motor-wagonette for public service any longer, owing to the continued persecution of the local authorities. He finds greater pleasure in using the car privately.

WE are requested by the Committee of the Automobile Club to remind members that entries for the Petroleum Spirit Trial of Saturday, the 13th inst., should be in the hands of the Club Secretary not later than Thursday next, the 11th inst., at 12 o'clock noon.

MR. MICHAEL MOYLE was brought up before Mr. Mead at the Thames Police Court on 26th ult., by the police, for driving furiously. They swore the pace at which he was going to be between fifteen and twenty miles an hour: one constable declared that he had never seen anything go so fast on the road before. After a severe fight the case was dismissed; Mr. Staplee Firth defended.

THE Right Hon. J. H. A. Macdonald, K.C.B. (Lord Justice Clerk of Scotland), has consented to take the chair at the Automobile Club dinner, which, by permission of the management of the Sheen House Club, will be held at Sheen House Club on Saturday, the 13th inst.

A FEW days since our attention was drawn by the Automobile Manufacturing Company, of Long Acre, W.C., to a remarkably small and compact lifting jack, for which they have the agency. The length is just about one foot, and the weight about 2 lbs. The jack has a screw action, is very easy to work, and will lift a Darracq voiturette, as we saw for ourselves, without any trouble. The same firm are also introducing a new acetylene lamp, somewhat similar to the Bleriot, but smaller and lighter, and which they claim gives as good a light.

HAVING noticed that many new purchasers of automobiles who have occasion to use accumulators meet with these articles for the first time, and have naturally the most vague ideas of what an accumulator or storage battery is, and how it differs from the dry cells or primary cells generally, Messrs. Peto and Radford, Limited, have got out a little pamphlet on the subject, which explains accumulators without unnecessary technical detail. The firm will be pleased to send a copy to any of our readers on application.

Building a Racing Motor-Car.

THE ENGLISH CARS FOR THE GORDON-BENNETT CUP RACE.

THE Gordon-Bennett race is the Derby of the Automobile World. It derives its name from Mr. Gordon-Bennett, the well-known American, who gave a valuable trophy to the Automobile Club de France to be raced for annually, and who desired it to be known as the International Challenge Cup, a wish that has hitherto not been complied with, for as the Gordon-Bennett race it has been popularly known and it is likely will continue to be. It is an international event, every country being able to send three selected and accepted cars, which cars must have been made throughout in the country they represent. The course, from Paris to Bordeaux, is a long and trying one. The fastest time accomplished in the Gordon-Bennett race last year, when the course was from Saint Cloud to Lyons, averaged out at a speed of thirty-eight miles per hour for over twelve hours. When one reflects for a moment that this

to make an effort to bring the trophy to these shores. To build a racing motor-car with a view to win a race of this description is quite as serious, perhaps even more serious, a matter than building a yacht, say, for the America Cup. Details are more numerous, there is less previous experience to go on, and since every part has to be English made to comply with the rules of the contest, and we are yet young here in automobile construction, many difficulties arise and delays occur, and, in fact, it takes nearly a year to complete a car. Needless to say, everything has to be the best obtainable, regardless of cost, one slight bit of false economy, one case of undiscovered scamped work, might cause a terrible accident, indeed the possibilities of a collapse when travelling at the rate of close upon 100 miles an hour are too great for contemplation.

So little is generally known as to how a racing motor-car is

PLANING THE FRAME.

FITTING ON THE 50 H.P. MOTOR.

prolonged high speed is maintained a whole day over highways and through towns and villages with their attendant obstacles, and that each car is driven from start to finish by the same driver, it will in some degree be realised what a fierce contest it is, and how terrific the strain both on the cars and their helmsmen.

For this year's race, on May 29th, three countries only will compete—England, France and Germany—Belgium and the United States, previous contestants, standing down. Each country competing can only have three starters, and as, for England, four Napier cars and one Motor Manufacturing Company's have been entered, it is necessary to have an eliminating contest, which has yet to be held. The four Napiers have been ordered by Count Zborowski, an English gentleman with a Polish title, the Hon. C. S. Rolls, Mr. Mark Mayhew, and Mr. S. F. Edge, and will be driven by them. The driver of the M.M.C. car is as yet uncertain. France will be represented by two Panhard and Levassor cars and a Mors, and Germany by a Cannstatt Daimler, a Canello-Durkopp, and a Benz.

The race this year has particular interest to Englishmen, since it is the first time cars manufactured in this country have been obtainable with sufficient speed power to warrant gentlemen

made, and how it slowly grows from a seemingly meaningless mass of steel and aluminium and gear wheels into a thing of wondrous power if not of outward beauty, that some hitherto unpublished details will doubtless be of interest. The majority of the cars being built to fight for England were designed for 50 h.p. motors, but the latter develop on what is known as the brake test 70 h.p., and it is the building of these speed giants that we will now briefly describe, our description in the main being, of course, equally applicable to the M.M.C. car.

The first thing required for a car is its frame, as it is to this that the motor itself, gearing, steering, axles, etc., have to be fitted. The frame is made of English channel steel, the name "channel" being derived from its shape, thus . Joined firmly together, the frame is carefully and slowly planed on a huge metal planing machine so as to get it absolutely true in every direction, a most essential thing where ultimate perfection is aimed at, but as the process takes about a week to perform, it is only in the case of expensive cars that we find it done.

The frame having been finished and tested by delicate measures and proved, big massive thing though it is, to be as true as an apothecary's scale, the springs are bolted on and then the axles. These axles are not particularly heavy, but they have

a goodly weight to carry, and as a broken axle at a speed of ninety miles an hour is a thing not to be risked, the forging of axles is one of the most important operations. When they arrive at the big steam hammer they are three pieces of good, honest metal; when they depart, after a brilliant pyrotechnic display of

LATHING THE ALUMINIUM CASTINGS—CASTINGS FOR 50 H.P. ENGINES IN FOREGROUND.

sparks, these three pieces are one, and in their unity attain a strength far above even what is required of them.

No special process is adopted with regard to the springs, but in making the wooden artillery wheels for these big racing cars extraordinary care is taken. The spokes are made from the true English oak. The tree after felling lies for a year where it fell to allow the sap to evaporate. It is then quartered and cleft into suitable pieces for spokes, and these pieces have to be stacked for several years until they are thoroughly and naturally seasoned. After this long and patient preparation the actual making of the spokes is quickly accomplished by two machines. The rim of the wheel is made of specially selected ash, free from knots, also kept a long time to thoroughly dry; and the steel rim that receives the pneumatic tire finishes the wheel proper. But there is yet the big 5in. pneumatic tire to be fitted, made of pure rubber and flexifort material, and it can be understood that by the time all is accomplished, the wheel is a somewhat costly item—indeed the pneumatic tires alone cost over £100 the set. But now the wheels are on the frame, which for the first time assumes the appearance of a vehicle, and being easily moved about the factory, the process of fitting the motor and gearing is commenced.

The motor itself is, of course, the all-important thing in a racing car, for there the power is developed that is capable of propelling at times the heavy vehicle over an ordinary road at a speed never attained by a locomotive over its carefully prepared and graded track. The cars that will fight for England in the great International event have four-cylindere motors, in other words they have four separate motors coupled together and working in unison. The "liners" are not made of steel, as might be supposed, but of cast iron, the reason being that this metal is not so liable to "seize" as engineers term the overheating of the cylinder, and also, being a metal with a finer grain than steel, it polishes better. This polishing of the cylinder takes five days to accomplish and is done with emery and oil. When it is mentioned that the pistons in these cylinders move up and down at from 760 to 1,100 times a minute, the necessity of their being perfectly true and as smooth as plate glass will be appreciated. The four cylinders being made are forced into a bed of

aluminium weighing 260 lbs. There they are tightly and solidly held, and, thanks to their expensive bed this remarkable result is attained, that the weight of the completed motor works out at 10 lbs. per horse power, the lightest engines that have ever been constructed.

Probably the next in importance to the motor proper, in the sight of the expert critic of a racing motor-car, is the crank shaft. This starts its career as a solid block of steel 4 ft. 6 in. long. With a powerful machine metal saw a rough semblance of a crank shaft is first hewn out, and then begins the long and painfully accurate process of lathing the seven bearings that the crank shaft carries. Each one of these seven bearings must be absolutely true in relation to every one of the other six, and all the while it is equally required that every part of the shaft should balance perfectly in weight. An inaccuracy no greater than the thickness of a piece of brown paper would represent the loss of about five horse-power in ultimate results, and therefore the most minute error in cutting condemns a crank shaft in spite of the three long weeks of continuous expert labour that has been spent in its creation.

The gear wheels for the gearing are made, as all gear wheels now are, by wonderful machines that cannot err, and we need only mention that they are cut out of solid forged steel and run continuously for five days in a bath of oil and hardened emery, in order to bring them to a glass-like polish before being fitted to the cars. In cars of the class we are describing much is hidden away, and is quite unsuspected by the casual observer. For instance, there are no less than fifteen roller bearings, eight in the wheels, the rest on the various shafts. These roller bearings are made up of a number of small rollers like thin lead pencils, each running in a bed of its own. They are essential for speed purposes, and, costly though they be, they are fitted. As in other parts of the car most minute accuracy is insisted upon, even in these roller bearings each roller that is more than a quarter of a thousandth of an inch out being rejected. It is as if they were intended for some small and costly chronometer rather than a great racing car. In addition to the roller bearings some ball bearings are used, notably in the steering (which, by the way, is as light to handle as a bicycle) and for the hubs of the wheels

FRAMES OF RACING CARS READY TO RECEIVE MOTORS.

to bear against when turning corners, so that speed even then shall in nowise be affected.

Having now seen the frame made and the engine, the speed-changing gear, and the wheels fitted to it, there remains one more link of leading importance, the means by which all

the power generated in the motor is conveyed to the road wheels. In different cars different means prevail; in the case of the cars that will fight for England the transmission is by gear wheels and chains. The chains are tested before being fitted to the car for a breaking strain of ten tons. Each chain used has 270 separate parts in it and takes seven days to make, having to go through

MAKING WHEELS OF ENGLISH OAK AND ASH FOR RACING CARS.

processes obviously impossible to describe here, since they are sixty in number. Accuracy in measurement of every part of the chain is insisted on, for an inaccuracy affecting the length of the link is multiplied by as many links as there are in the chain.

As may be supposed, in the case of a car that is expected to be called upon to average fifty to sixty miles an hour and at times

TESTING THE DRIVING CHAINS FOR RACING CARS. CHAIN IN PICTURE IS BEING TESTED UP TO A STRAIN OF 6,000 LBS.

to travel at possibly one hundred miles per hour, for over twelve hours at a stretch—a trial no locomotive has ever been called upon to bear—much thought is expended on its lubricating and also cooling arrangements. Every bearing on the car, except in the wheels, is fed continuously from what is known as a "sight-feed" oil tank, being conveyed from thence to each bearing by a separate

copper tube, the whole forming a perfect net work of tubes, running off in all directions like wires from a central telephone exchange. The engine lubricates itself by a force pump of its own working, so that the faster it goes and the more food it requires, the more it ladles out for itself from the oil tank into its parched and fiery mouth.

As for the cooling, a water pump, as long as the engine is running, keeps forcing 200 feet of water every minute up to the engine, circulating round it in a frigid embrace, away to the radiators, racing round and round the long lengths of copper pipes, smothered in radiating gills of tin, and thus, cool and refreshed, flow back to the pump ready for the same useful round of work again. There are many details in the process of building these mighty speed kings of the road that space will not permit us to detail, such, for instance, as the four powerful brakes, water-cooled, or they would otherwise fire when pulling up a vehicle travelling at fifty miles an hour; the electric spark that ignites the charges whose explosions provide the motive force for the engine; the body, etc., etc.; but enough has been said to show that the building of a motor-car worthy to fight for England is no light undertaking, and, incidentally, to what perfection motor-car building has reached in this country, considering how few are the years of experience that have gone before.

And so the cars are finished and ready for the fray, ready and able to run seventy-three miles an hour on their normal speed, or on being pressed, by advancing the ignition, which corresponds to the forced draught of a steam boiler, to run at over 100 miles an hour. May they have good fortune in the contest of giants and worthily uphold the sporting honour of the country they were made in.

THE hill-climbing competition between Neuwaldegg and the Exelberg has been fixed by the Austrian Automobile Club for May 5th next.

AN automobile race meeting is to be held on the track of the Renn Club, at Frankfort-on-the-Main, on July 29th next; it is being organised by the Frankfort Automobile Club.

THE U.S. Secretary of State has been requested by the District Commissioners, Washington, D. C., to assist them in securing information relative to the regulation of the speed of automobiles in the cities of foreign countries.

A NOVELTY shown at the recent Paris motor exhibition consisted in a pinion with movable teeth. By means of a rack which may be displaced inside a series of pinions, the teeth of the latter may be withdrawn below the surface and the pinion and its corresponding gear thus disengaged.

THE Olds Motor Works, of Detroit, Mich., have sent us a copy of a tastefully-prepared little catalogue they have lately issued. Both petrol and electric vehicles are among their product; the new petrol light runabout particularly is attracting a great deal of attention. It is a powerful little machine, fitted with a 4 h.p. engine. The electric vehicles, which are built in several styles, are exceedingly handsome in appearance, specially adapted for town use.

THE Panhard cars taken over to the United States by Mr. J. W. S. Langerman, and seized for alleged false valuation by the owner, have been appraised by the Customs authorities at £1,442. One is of 12 h.p., seating four, and the other of 8 h.p., seating four. In accordance with law the United States Court has been notified of the seizure, and if the owner does not contest the case within about a month the Court will order the United States marshal to sell them. The sale must be advertised three weeks in advance.

MR. MARTIN DODGE, director of the Office of Public Road Inquiries of the United States Agricultural Department, will shortly take a party of eight experts over the old National Road, from Washington to Springfield, O. They will travel in a motor-car, the object of the trip being to learn the present condition of the National Road. If the roadway is in a fair state of preservation Mr. Dodge will seek to have it improved and converted into a model highway for motor-vehicles and for practice cavalry marches.

SIDE-SLIP.

THE only source of lack of control in an automobile which cannot be entirely got rid of is that which gives its title to this article, a risk which with the increase of speed and the accompanying necessity for pneumatic tires has grown in importance. It may, however, be partially avoided, and its effect minimised, by suitable design, and a short consideration of the principles involved will throw some light on the direction in which this should be attempted.

FIG. 1.

The ability to steer any vehicle depends on the fact that while the rolling friction of a wheel is small, its resistance to sideways motion, which involves sliding friction, is large, and is unaffected by the former motion; if therefore the latter resistance can be increased, it will be one means of attaining the desired end. Unfortunately this seems difficult, and may be left for later consideration, the more important problem, as to the effect of car design on side-slip, the resistances being given as usual with ordinary tires, being first discussed.

Let A, B (Fig. 1) be a pair of wheels on an axle, which a small force P is sufficient to draw along a level surface, and suppose a much larger force Q, which is yet insufficient to skid the wheels sideways, to be applied at the end of the axle. When the force P is applied, it will draw the wheels along in a straight line, quite unaffected by the force Q.

If now the wheels be supposed locked, as by a powerful brake, a much larger force, say P', will be needed to drag them forwards, and when it does so (Q remaining the same), the motion will be somewhere in the direction R, the force Q, inoperative as long as the wheels roll, producing its effect as soon as sliding motion is started by the force P. From this it appears why the application of brakes tends to cause side-slip, and it may be added that sufficient driving force to cause the wheels to slip would do so equally, and though this is never important, it may sometimes be noticed when driving up a steep, greasy hill.

In the case of a four-wheeled car (Fig. 2) the force Q is due to the inertia of the car, when turning a corner, tending to carry it in its original line of motion.

It obviously acts at the car's centre of gravity, and when—as usual—this is nearer the back axle than the front, tends to swing the back round. This tendency might be diminished by having the weight evenly divided between the wheels; but as it

is less risky for the rear than the front wheels to slip, the usual position of the chain gear is preferable. Moreover, while the tendency of the car to slip as a whole cannot be altered by any variation of design, its tendency to rotate diminishes with the length of wheelbase; it will be sufficiently obvious that, given two cars on a greasy asphalt surface, one of short and one of indefinitely long wheelbase, but otherwise equal, they will offer equal resistance to being moved bodily sideways, but the longer one will offer an indefinitely greater resistance to being twisted out of its course.

Also, to move the car bodily requires the resistance of all four wheels to be overcome, while to divert its course only needs that of two; it is fortunate, therefore, that the latter can be obviated by lengthening the wheelbase, while the former, a less dangerous fault, can only be modified by in some way giving the tires a better grip of the road.

The tendency here described was notably exemplified in the Bollée, where the small adhesion of the single rear wheel was aided by the weight of engine and accessories, carried far to the rear, and aggravated by the short wheelbase. It will be noticed that the effect of increased weight causing increased adhesion on the back wheels is here neglected: it actually seems to be negligible compared with the effects above described, though the reason for this is rather obscure; it is probably, however, to be sought in the fact that slip is only noticeable on wet and muddy roads, where the friction cannot be taken as increasing with the weight. So far, then, as design goes, the adoption of a long wheelbase, and chain gear somewhat, but not too far, behind the centre, appear the only methods for securing stability in steering, and the only remaining point to dwell on relates to the tires. Iron tyres, though having a low coefficient of friction with the road, did not seem to be liable to slip; and though high speeds were obtained on them in the early steam-carriage days, no mention of it occurs to the writer's knowledge. Solid rubber tires do not slip, except on asphalt or hard roads with thick mud thereon. Pneumatics, of course, are the chief offenders, and the reason is, apparently, that they present too large a surface to the road to penetrate through mud to the solid surface below. It would, therefore, seem that small wheels are preferable to large ones, as the devices for increasing grip by a rough surface, successful on cycles, are so far useless with heavy loads. There is, moreover, a pseudo-slip due to the roll of the tire on the rim, which might be roughly estimated by the comparison of a pneumatic with a solid or practically solid tire of

FIG. 2.

similar dimensions, such as the Falconnet-Perodeaud, which should be comparatively free from this; but until some means are found of endowing the pneumatic with a tread capable of penetrating mud and gripping the road surface, it is difficult to imagine any palliative other than that obtainable from the design of the car.

R. W. BUTTEMER.

LA COMPAGNIE FRANCAISE'S 6 H.P. "TONNEAU."

La Compagnie Française des Cycles et Automobiles, 7, Rue Darboy, Paris, have recently introduced a new four-seated *tonneau*. Fig. 2 gives a plan of the frame, from which it will be seen that the engine is located at one side, at about the centre. The motive power is provided by a 6 h.p. Onfray single cylinder

FIG. 1.—GENERAL VIEW.

horizontal engine (Fig. 3), fitted with electric ignition, using the De Dion plug; the cylinder is water cooled, the circulation being maintained by a centrifugal pump actuated by friction on the fly-wheel of the motor. The valves are of relatively large size, as is also, it will be noticed, the exhaust box or silencer,

FIG. 2.—PLAN OF FRAME.

which is located at the rear of the tubular frame. The carburettor is of the Longuemare type. As regards the transmission, three speeds forward and a reverse motion are available. From the motor shaft the power is transmitted to a countershaft by spur wheels, the teeth of which are always in mesh. The pinions

on the countershaft are rigidly keyed, while those on the engine shaft are free to revolve over separate friction clutches. On the engine being started, the engine shaft and the clutches fixed thereto revolve inside the gear wheels, but upon any one clutch being expanded the gear wheel instantly becomes a part of the main shaft and the car is started. This, of course, brings all the gear wheels into motion, so that in changing speeds the operation is done with the gear wheels running in mesh. The same prin-

FIG. 3.—THE ONFRAY 6 H.P. MOTOR.

ciple is applied in the reverse motion, but a chain is substituted for gearing. Wheel steering is fitted while the engine is started by a handle at the side. The petrol tank has a capacity of a little over four gallons, said to be sufficient for an eighty miles run under adverse conditions. Eight gallons of water are carried. Ample brake power is provided, while the road-wheels are of the cycle type, shod with 90mm. pneumatic tires.

AN AMERICAN 100-MILE ENDURANCE TEST.

THE following are the conditions which have been authorised by the board of governors of the Automobile Club of Long Island for the 100-mile endurance test shortly to be held on Long Island.

- 1 and 2. Open to three classes—steam, petrol, and electricity. Special prizes issued for each class.
3. Application for entrance of other motive powers will be received and given due consideration.
4. Course to be over macadamized roads on Long Island, including grades, levels, etc.; no retracing; 100 miles within a 12 hour limit.
5. Notices of the forthcoming endurance test to be sent to all village authorities through which the course may be laid, requesting their co-operation.
6. Speed limit of 8 miles through villages and towns, with a maximum speed limit of 15 miles per hour.
7. All contestants are to provide their own fuel and water, either by preliminary arrangement or by transportation.
8. Owners of electric carriages to arrange for battery relays.
9. In case of a tie between two vehicles of the same type, the best average time, taking into consideration the amount of fuel consumed, the weight of the carriage and non-stops.
10. Hill-climbing contest to take place on the grade between Jamaica and Flushing. At this point there is a grade estimated to be about 20 per cent., and about one quarter of a mile long.
11. Entries are to be confined to self-propelled vehicles, so constructed as to carry at least two passengers seated side by side. All vehicles have to carry the full complement of passengers.

CONSEQUENT on applications being made to the authorities in the Wilmslow district of Cheshire for permission to store motor spirit, several members of the local Council have raised objections to the liquid being kept in quantities anywhere near dwelling-houses or other buildings.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

CONTINENTAL NOTES.

BY "AUTOMAN."

I MET the Hon. C. S. Rolls at the A.C.F. last Sunday, busy pasting cuttings out of many maps for the route between Paris and Bordeaux. He tells me he had his first run in his new 24 h.p. Mors a few days ago. He took the car from Paris to Versailles through the snow and mud, and although the conditions were so bad it behaved very well, the second speed giving about the same result as the fourth speed of his old 12 h.p. Panhard. The new car is seated for two, racing trim, aluminium body, four cylinders, electric ignition only. The total weight of the vehicle is 1,350 kilos., and it is very silent, especially when slowed down by the new regulator. Mr. Rolls starts in a few days to learn the route thoroughly from Paris to Bordeaux, ready for the Gordon-Bennett race. He is not, of course, driving his Mors in the Gordon-Bennett race, but expects to steer a Napier to success.

MR. ROLLS was, I believe, about the first Englishman to be authorised by examination to drive a Panhard car in France—his examination dates as far back as the beginning of 1898. Although he has driven in France to a very considerable extent, he has not had a single contravention. He has just passed a further examination on his new Mors, and has been granted a certificate authorising him to drive any petrol car. The examination is made by the Chief Engineer of the Mining Department.

FASHION in motor-cars has made many victims, and the latest is the French company which was founded to develop the Renaux tricycle. Every motorist will remember the race from Paris to St. Malo in 1899, when young Renaux on his 3 h.p. tricycle made such a brilliant record, beating all comers, whether motor-cars or motor-cycles. Just about the time of the formation of this company tricycles went practically out of fashion, and the makers, having been unable to sell their production, have decided to dispose of their undertaking to two of their late employees, who intend to abandon the tricycle and make an 8 h.p. motor-car on the lines of Renault or Darracq.

EVERYONE is talking about the unqualified success of the Mercedes car in the Nice races. Only a year ago the German Daimler was chiefly identified by its heavy, ungraceful lines, when a gentleman whose stage name is Mercedes, but whose real name is Jellineck, took it into his head that a better article could be turned out by the Cannstatt manufacturers. Heset to work with Mr. Maybach, of carburettor fame (who is, by the way, manager of the German Daimler factory), and very soon the low, racy, trim-looking 35 h.p. car, which has already been illustrated in the *Journal*, began to make its appearance, and also to make its mark in the automobile world. The brakes on this car are a special feature: they cannot fire, as by a special arrangement they are sprinkled with water whenever in use. The cooling arrangements are costly but very efficacious, consisting of 5,800 tubes with a cooling surface of thirty-six square metres, and only requiring a gallon and a half of water. In racing trim the car weighs only 1,060 kilos.

THE A.C.F. are organising, in connection with the coming race between Paris and Berlin, a touring competition in which regularity rather than speed will be taken into consideration. A start will be made from Paris about June 25th, and the journey will last about ten days, an average of 150 kilometres per day being maintained. In order to encourage manufacturers to enter their cars diplomas will be given to those whose average running is the best and most regular. Several plans are proposed for obtaining a record of the results. On the one hand it is suggested to give each driver a photographic apparatus, and let him take pictures of the faces of clocks which will be placed at agreed spots on the route. Another suggestion which seems more practicable is to have fixed controls at various intervals and a moving control to take a record of the stops, either voluntary or in-

voluntary, and to prevent racing. It promises to be a most interesting tour, and it is open to tourists of all nations. Arrangements are being made by which a Belgian contingent will join the caravan in Luxembourg and a German contingent on the frontier of Germany.

AUTOMOBILISM seems to have taken root in Spain, in spite of the bad state of the roads in general, and it is said that £80,000 worth of cars have already been imported. There are two motor-car works being established, one in Barcelona and the other in Madrid.

THE motor-car is becoming quite a factor in politics nowadays, and the fortunes of politicians may often in the future depend upon a carburettor or a pneumatic tire. Mr. Max-Regis, the arch-enemy of the Jews in France, laid a deep plan for spreading his doctrines in Tunis with the help of a four-seated automobile, and by means of which he was going to make his crusade in Northern Africa in a speedy and comfortable manner. However, he did not reckon with the strike in Marseilles, and his car only got as far as the docks in that city, where it has been "stuck up" to await the termination of the dockers' dispute.

THE latest automobile club is that about to be formed in Tunis, as a result of the recent tour in Algeria. The club is to be called the Auto-Vélo Club Tunisien, and the first president will be the Count de Farconnet. The club will seek to be affiliated with the A.C.F. This step will greatly facilitate tours in Algiers, and would-be tourists belonging to any of the affiliated clubs will be able to get information as to the routes and transport across the Mediterranean, and thus touring in Algiers will be made easy.

THE *Auto-Vélo's* second article by Michelin is distinctly disappointing. Whereas the reader of the first was lead to expect some good hints which would enable him to avoid puncturing his tires, this second article is purely an advertisement for Michelin rims, advising their use in every case, and stating that they are different in section to any other rims. They are made so that the thickened edges of the Michelin cover fit exactly in the rim like a foot fits in a well-made boot, and, as in the latter case, a good fit prevents soreness and injury to the foot, so argues Michelin the cover resists longer, and is less injured when fitted into a Michelin rim.

NOW that Nice has closed its series of automobile races and fetes, Draguignan is inviting *chauffeurs* to take part in a meeting which is being organised for the 21st and 22nd inst. The programme for the 21st inst. comprises a 1 kilometre contest in the form of a pool, and for the afternoon of the same day a grand *carrousel*. The next day there will be a race of 180 kilometres, from Draguignan to Hyères and back, followed by an exhibition of the cars that have been in the contests. Many vehicles have already been entered for these events, and the success of the chief contest for speed is almost assured in advance by the excellent quality of the roads and the scarcity of villages along the route.

THE members of the Yorkshire Automobile Club will hold a run on Easter Monday from Leeds to Bolton Woods, starting at 10 a.m.; on Good Friday there was to be a run to Harrogate and Ripon.

COUNT KARL SCHOENBORN, who is to be married in Rome in the middle of the present month, will immediately start on his honeymoon trip in an automobile; he intends thus to cover the whole distance between Rome and Miscolez, in Hungary, where his estates are situated.

MR. JOHN G. MIDDLETON, assistant-secretary of the Church Society for the Promotion of Kindness to Animals, in the course of an address delivered in Scarborough last week, said all would agree that horses were subject to poignant suffering which might be entirely avoided by the use of motor-cars in dragging heavy loads, whether of merchandise or of passengers, along the streets and up steep ascents.

THE DYKE TOOL KIT.

THE accompanying illustration shows the Dyke automobile tool kit, with its set of tools specially adapted for automobile use. The kit, which is manufactured by the St. Louis Automobile and Supply Company, St. Louis, U.S.A.,

folds up into a small space when not in use, and will be found handy for roadside adjustments.

THE BUCHET PETROLEUM-SPIRIT MOTORS.

SINCE M. Buchet introduced his well-known *culasse* considerable attention has been centred on his products, so that a brief description of the latest engines turned out from the Ateliers Buchet, at Levallois-Perret, near Paris, may not be without interest. Fig. 1 gives a view of a two-cylinder air-

FIG. 1.—THE BUCHET 6-H.P. 2-CYLINDER AIR-COOLED MOTOR.

cooled motor recently introduced for racing motor-cycles and for voiturettes. The cylinders have a diameter of 85 mm. by 80 mm. stroke, the capacity being rated at 6 h.p. The construction closely follows the De Dion type, except as regards the combustion chamber. It will be seen that both the inlet and exhaust valves are located directly on the cylinder top. From this construc-

tion a freer escape of the exhaust gases is obtained, which is claimed to be the cause of the high power developed by the engine. The exhaust valves of the two cylinders are operated by a double cam in one piece, which makes it impossible to shift the time of exhaust of one cylinder with regard to the time of exhaust of the other. This double cam is located between the two cylinders. A long-armed bracket is bolted to the cylinder head, and a double-arm lever, pivoted on the end of this bracket, reverses the direction of the motion of the cam-rod. The ignition gear is so arranged that the lead given to the ignition spark is absolutely the same for both cylinders. A single cam operates both vibrator springs or tremblers. M. Buchet has recently supplied a four-cylinder air-cooled engine of this type to M. Santos-Dumont for his dirigible balloon; it is said to develop 16 h.p. and to weigh only 202 lbs. There are altogether eight fly-wheels, connected by cemented steel shafts running in phosphor-bronze bearings. The

FIG. 2.—THE BUCHET 6-H.P. WATER-COOLED MOTOR.

exhaust valves of each pair of cylinders are controlled by a single double cam. The ignition device is so arranged that the explosions take place in the following order—cylinders 1, 3, 2, 4, so that the parts are well balanced.

Water-cooled motors are also now being made by M. Buchet in one, two, and four cylinder types. Fig. 2 gives a section of the single-cylinder water-cooled engine. The exhaust valve is arranged, as usual, in the cylinder top, while it will be noticed that the water-jacket is carried round the valve chambers as well as round the cylinder. The diameter of the cylinder is 100mm., and the stroke 100mm. (roundly 4in. by 4in.), and tests have shown the engine, although rated at only 6 h.p., to develop, running at 1,600 revolutions per minute, 6.72 h.p.; at 1,800 revolutions, 6.78 h.p.; and at 1,972 revolutions, 7.2 h.p. The fly-wheels and crank shafts work in aluminium oil-containing cases provided with outlets at the bottom for draining off old lubricating oil, etc.

THE MOTOR VEHICLE USERS' DEFENCE ASSOCIATION.

IT will be remembered by most of our readers that this association was formed in the early part of last year for the general protection of motor vehicle users against proceedings and actions at law, either civil or criminal, and where necessary to commence proceedings at law, either civil or criminal, and generally to protect the interests of motor vehicle users throughout the United Kingdom.

Captain the Honorable Cecil Duncombe, J.P., the Honorable John Scott Montagu, M.P., and Sir David Salomons, J.P., consented to act as trustees. A representative committee was elected to conduct the business of the association. Mr. Roger W. Wallace, K.C., was chairman, and Mr. Frederick R. Simms, vice-chairman; the other members of the committee being Sir Edward Jenkinson, K.C.B., Major H. C. L. Holden, R.A., F.R.S., the Honorable C. S. Rolls, and Messrs. R. E. Phillips, J. J. Mann, Claude Johnson, C. Cordingley, S. F. Edge, and F. F. Wellington.

Mr. Thomas W. Staplee Firth (Messrs. Firth and Company) acted as solicitor, Mr. George R. Helmore, A.C.A., barrister-at-law, acted as treasurer and secretary, and the hon. auditors were Messrs. Helmore and Helmore, Chartered Accountants.

During the year there were frequent meetings of the Committee, who had important cases to deal with, and in all cases in which they were asked to assist a member of the Association, funds were voted for that purpose.

Mr. Helmore presented a very satisfactory report upon the work of the Association during the year 1900, which showed that very good and useful business had been done, and that the financial position (certified by the hon. auditors) of the Association was sound.

Our readers are aware that an Association styled the Motor Union has been formed to act in a more comprehensive and extensive way, and with a view to bringing more interest to bear for the general protection of automobilists, and it was unanimously agreed that it would be greatly to the advantage of the above Association to be merged in the Motor Union.

A general meeting was called for this purpose on the 29th March last, and resolutions to the following effect were passed:—

- (1.) "That the Motor-Vehicle Users' Defence Association hereby agree to be merged in the Motor Union about to be formed, and that the trustees be and are hereby authorised to direct that the funds of the Association be handed over to the Motor Union.
- (2.) That the secretary be authorised with the consent of the trustees to cancel the trust deed.
- (3.) That the committee and secretary be and they are hereby authorised and directed to hand over such funds as may be in their hands to the said Motor Union.
- (4.) That all necessary steps be taken to wind up the affairs of the Motor Vehicle Users' Defence Association."

It must therefore be observed that the Motor Vehicle Users' Defence Association now becomes extinct and is merged in the Motor Union, which will be conducted upon the same lines as the Motor Vehicle Users' Defence Association, but under the scheme of the Motor Union much larger funds will be available and the area of its operations will be extended.

The general meeting referred to was a most successful one, and a cordial vote of thanks was passed to the Hon. John Scott Montagu and Sir David Salomons, for acting as the Trustees of the Association, and to Mr. T. W. Staplee Firth and Mr. G. R. Helmore, for their active co-operation and assistance in carrying out the objects of the Association.

An interesting article entitled "Electric Vehicles v. Tram-cars" appears in the current issue of *Cassier's Magazine*.

THE Allgemeine Schnaufferl Club, of Munich, Germany, has offered three prizes for the best Germanisation of the words automobile, automobilism, and automobilist.

HERE AND THERE.

THE Scottish Automobile Club held a run to Peebles on Saturday last.

A RACE from Strassburg to Colmar and back, a distance of 230 kilometres, is being organised by the Alsace-Lorraine Automobile Club; it is to be run off on June 16th next.

THE unusually heavy snowstorms which have occurred throughout England and the Continent during the past winter have done much to prove the practicability of the motor-vehicle.

WE hear that the Progress Motor Company, of Coventry, are working on designs for a new car, with the motor in front, but otherwise practically similar to their present pattern of vehicle.

TWO candidates for Local Council elections at Pontypridd, South Wales, who used motor-cars to assist the lagging voters, were both returned at the head of the poll.

EARL DE LA WARR, who headed the poll at the Bexhill Urban Council election last week, found his motor-car very useful on the voting day.

MESSRS. JOHN HUTTON, SONS AND CO., of Dublin, are arranging to have a large display of motor-cars in the Veterinary Paddock at the spring show of the Royal Dublin Society, which opens at Ball's Bridge, Dublin, on the 9th inst.

THE Speedwell Motor Company, of Reading, have sent us a copy of their catalogue, which comprises illustrations and descriptions of the Argyll, Sirene, Boyer, De Dion, Darracq, Renault, voiturettes, Benz and Panhard cars, Locomobile and Serpollet steam cars, etc.

WITH regard to Mr. Ballin Hinde's motor-car journey from Frankfort over the Alps to Cannes, reported in our last issue, Messrs. Hewetsons, Limited, inform us that the car is a 12-h.p. Benz tonneau, supplied by them to Mr. Hinde, and that it carried four persons.

FOR the convenience of their customers touring, etc., at Easter time, the United Motor Industries, of 40, Holborn Viaduct, E.C., have arranged to have their premises open on Saturday morning for the purpose of attending to urgent orders.

IT may be of benefit to those readers who may be visiting the Crystal Palace during the Easter holidays to know that Mr. Robin Wood, of the Crystal Palace Engineering and Cycle Works, Church Road, West Norwood, stocks petrol, lubricating oil, etc., which can be obtained at any time. Mr. Wood also undertakes motor repairs.

WHAT is said to be the finest car yet seen in South Wales has recently been delivered from the Daimler Works, to Mr. T. Penrose Thomas, of Swansea, for his private use. It has been fitted with all the latest improvements, and was supplied through Messrs. Morris Brothers, Pontypridd, the local Daimler agents.

WE are sorry to learn that the Merthyr Motor-Car Service has been terminated in consequence of the decease of the active proprietor of the company, Mr. Lewis Jenkins. The deceased started his motor-career in October, 1899, and persevered diligently, but a serious attack of rheumatic fever affected his heart.

CALLING in at the United Motor Industries' depot on Holborn Viaduct, E.C., the other day we had an opportunity of inspecting one of the "U.M.I." frames which should be of interest to those firms who are contemplating building up light cars. The frame, which is intended for a light car with engine up to 4½ h.p., is complete with the differential and speed-changing gears, including three speeds forward and reverse, steering gear, including the inclined steering wheel, on the standard of which all the levers are fitted, springs, axles, and hubs. The frame, which is arranged for the motor to be in front, is of tubular construction, a channel-steel support being, however, fitted to receive the motor. The system of transmission is on the lines of that adopted in the Sirene and Renault voiturettes, viz., by *cardan*, or universally-jointed shaft, terminating by bevel gearing direct on the rear axle.

THE first general meeting of the shareholders of the Northern Carriage and Motor Company, Limited, of Aberdeen, was held a few days ago. Mr. J. McRae, the managing director, explained that the progress made was much beyond what was anticipated, and that he had little doubt that the business they had undertaken would prove a great success. A discussion afterwards took place regarding the running of motor-cars on the Echt road.

MOTOR-LORRIES are rapidly coming into favour in Aberdeen, as elsewhere. Recently a company was formed in Aberdeen, under the name of the "Speedwell Motor-Lorry Company," for the manufacture of these lorries, and it is understood that there is every prospect of it being carried on with success. One of these lorries travels constantly between Aberdeen and Dunecht Quarries, and conveys granite to the city from the quarries. A regular goods traffic is also conducted between Banchory and Aberdeen by another lorry. The vehicle journeys by the North Deeside Road, and arrives in Aberdeen from Banchory in the early morning, and proceeds back in the afternoon. It has been in use for upwards of a week.

AMONG the several concerns that are devoting attention to the question of lubricating oils for motor-cars are the Vacuum Oil Company, of 47, Victoria Street, Westminster, who are making five different oils for the purpose, viz.:—No. 1, Mobiloil, suitable for water-cooled motors, and for air-cooled up to 1½ h.p.; No. 2, ditto, for air-cooled motors larger than 1½ h.p.; Rarus cylinder oil, a clear and not too limpid oil, also suitable for air-cooled motor lubrication; Red V cylinder oil and Red M engine, for steam motors. The Vacuum oils are being used by several motor-car firms, the Locomobile Company recommending Red V and Red M for use on their steam cars. They are claimed to be free from charring and evaporation, to retain sufficient viscosity under extreme heat conditions, and to give off no objectionable odours.

THE Swift Cycle Company, of Coventry, who have been building motor-tricycles and quadricycles for some time past, have just completed their first car. It underwent its trial run a few days ago from Coventry to Hinckley and back, and stood the test in a very satisfactory manner. The car is fitted with a 4½ h.p. M.M.C.'s engine, placed under a bonnet in the fore part of the frame. Chain driving is used, with two speeds, while a brake is fitted on the countershaft and a double brake on the rear hubs. Reversing gear is fitted if required. Electric ignition is used, and the steering wheel is brought up by a slightly-raked pillar to within convenient reach of the occupant of the right-hand seat. The car, as at present built, accommodates three persons, two in front and one at the rear, but a body to accommodate either two or four persons can be fitted. The frame is of tubular construction.

THE LONDON MOTOR COMPANY v. THE DAIMLER MOTOR COMPANY.

THE case of the London Motor Company, Ltd., v. the Daimler Motor Company, Ltd., which was down for hearing in the King's Bench Division, was mentioned before Mr. Justice Lawrence on Monday. Mr. Danckwerts, K.C., who appeared on behalf of the plaintiff company, said he had consulted with his learned friend, Mr. Hammond Chambers, K.C., on the other side, and he was in a position to say that the parties thought they had agreed to settle their differences. It only required a meeting of the directors to confirm the acceptance of the terms, and therefore he asked his lordship to allow the case to stand over until next sittings. The matter stood over accordingly.

THE LINCOLN MOTOR 'BUS COMPANY.

THE annual meeting of the shareholders of the Lincoln Motor 'Bus Company was held last week. The chairman of the company, Coun. W. S. White, presided, and amongst those present were Coun. Goy, Messrs. F. Brown, F. Higgs, J. W. Enderby, Sneath, A. W. Goodall (manager), and J. H. Foster (solicitor to the company). The balance-sheet showed a loss on the year's working of £694. In moving the adoption of the balance-sheet, Mr. W. S. White said it was a somewhat disappointing one, but considering that the company was a new one too, they were not altogether surprised. After going carefully into the whole matter he saw a silver lining to the dark cloud. There would be in the future a saving in repairs, cost of petrol, management, etc., of about £475. The whole of the six cars were now running, and that was something which every company could not say. They looked forward, therefore, to a much larger return, and they hoped to add considerably to their income during the coming summer by catering for private hire. One satis-

factory feature of the year's working was the fact that during the whole twelve months there had not been a single accident from the 'buses. In a town where motor 'buses had not been before, and where people were naturally somewhat nervous about them, that was no small tribute to the skill of the drivers. The adoption of the report was seconded by Mr. F. Brown, and carried, after a number of questions had been asked as to the working of the company.

THE LONDON ELECTRIC CAB COMPANY.

A SHAREHOLDER'S petition to wind up this company compulsorily was heard last week. It was stated that the petition was first before the Court in October last, when it stood over in order to ascertain the value of certain licences. The official receiver had now reported that they were practically of no value, and it was at his request the matter was now brought before the Court. Mr. Justice Wright said that he must dismiss the petition, as the petitioners were shareholders. The official receiver's report showed that there were practically no assets, and therefore no benefit could accrue to the petitioners from an order.

FURIOUS DRIVING CASE.

AT the Lymington Borough Bench last week Frederick Mills was summoned for driving a motor-car at an unreasonable speed on the highway. Defendant did not appear. P.C. Osgood stated that on Monday, March 11th, about 2.25 p.m., in Queen Street, he saw defendant driving a motor-car. As he came round the corner of St. Thomas Street witness took out his watch and timed him from the corner of St. Thomas Street to Avenue House. It is 380 yards, and he covered it in thirty-five seconds—that is, over twenty-two miles an hour. Isaac Newton Hayball, who was with Mills in the motor-car, said they had to slow up and put the car on half-speed. In reply to the Chairman, witness said: "We were not going more than ten miles round St. Thomas Street. We could pull up in six yards by throwing the engines out of gear and patting on all the brakes. Fined 10s. and 13s. costs."

OMITTING TO SIGNAL.

AT the Greenwich Police Court last week, William Stone, of New Cross, was summoned for neglecting to sound a bell or whistle whilst riding a motor-car on approaching another vehicle. Police constable 103 P said that on March 10th defendant was riding along New Cross Road, and on approaching a tramcar neglected to sound a bell or whistle. The horse of the tramcar was frightened and fell. Defendant said that he thought the noise of the machine was sufficient. It frightened the horse, and if he had sounded his whistle it would have made matters worse. The magistrate fined him 5s., with 2s. costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

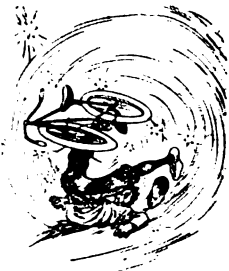

Vol. III.]

LONDON, SATURDAY, APRIL 13, 1901.

[No. 110.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Easter Cyclist Manœuvres, beside teaching cyclists many and valuable hints, have also clearly demonstrated the capabilities of the motor-car for quick and effective transportation. The wretched condition of the roads seriously handicapped the work of the cyclists, who were often seen plodding laboriously along, whilst with a quick sharp buzz, a motor-car, carrying a glittering staff of officers, rushed quickly past. Nothing handicapped the motor-cars, and only in one case was there anything like a break-down.

This was with a contingent on its return from Epping Forest to the Bank. The break-down was of a trivial character, and solely gave the costermongers in their barrows a grand opportunity for hurling unsympathetic remarks at the horseless vehicle. A motor-cycle proved a boon to one contingent of the invading force, but a convoy of war material in motor-cars was unfortunately captured. A Singer motor-bicycle took part in the Suffolk manœuvres on Good Friday, and gave the greatest satisfaction to all parties.

Mr. Benn on Municipal Motor Service.

THE London County Council are still considering the possibilities of a service of municipal motor-cars as a solution to the Housing question difficulties. In an unofficial interview Mr. Benn, chairman of the Highways Committee of the County Council, stated that the system of radiating thoroughfares, as proposed in Mr. Balfour's letter of February 12th, "must not be taken too seriously." However, Mr. Benn spoke in optimistic terms of the realisation of Mr. Balfour's ideas on the possibilities of motor-cars. As a first step, Mr. Benn suggested that motor-buses should be substituted on the short routes, which, because they could not be joined with the tramways, are at present served by horse buses. With regard to the capability of motor-manufacturers to cope with municipal demands, Mr. Benn stated that some months ago nothing entirely satisfactory was on the market, but as a result of the advance of the trade in the interim it was practically certain that the demands could now be satisfied. Whether or not the L.C.C. could run motor-cars without additional Parliamentary powers Mr. Benn was not in a position to state, pending the appeal to the House of Lords. If, however, the decision were given against them, he thought that there would be little or no difficulty in securing an Act, backed by the Leader of the House.

The Right of Traffic in Main Streets.

By a tyrannical order the Provost and magistrates of the Royal Burgh of Stromness sought to prohibit cycle traffic in five of the main streets of the town. In order to test the legality of such an order Mr. William Baikie rode through one of the forbidden streets. Immediately the police seized him, and at the local police-court he was fined 10s. or seven days. Not content with the decision of the police-court magistrates, who in more than one town have displayed marked inaptitude for their

positions, Mr. Baikie appealed to the High Court of Justiciary. After strongly commenting upon the illegal order of the Provost and magistrates, the High Court of Justiciary not only quashed the conviction but awarded the appellant ten guineas and expenses. The action of Mr. Baikie in the interests of the public not only deserves the warm appreciation of all cyclists but of every automobilist in the kingdom, seeing that if the Stromness authorities were left in undisputed command of the streets, it would be a very small step indeed to the prohibition of motor traffic.

A Gear-Driven New Orleans Car.

AMONG the many cars which took part in the Easter tour of the Automobile Club was a new one weighing complete about 8 cwt., turned out from the New Orleans Works at Twickenham. Outwardly it resembles the company's 6 h.p. vehicle, the chief alteration being the adoption of gear driving in place of belts. Power is supplied by a water-cooled two-cylinder engine of 7 h.p. The variable speed gear is adapted to give three speeds forward and reverse. From the gear box the power is transmitted to the rear axle direct by a longitudinal shaft and bevel gearing. The performance of the car in the tour, particularly as regards its hill-climbing qualities, has been much commented upon.

County Councils and Motor-Cars.

SEVERAL members of the West Riding of Yorkshire County Council attended at the Automobile Club recently. The Chairman of the County Council explained to the Club Secretary that they were strongly in favour of numbering motor-vehicles, and asked for the views of the Club on the matter. The Secretary explained that the Automobile Club were very adverse to numbering, as it would undoubtedly do great harm to the industry. He pointed out that although some four months had elapsed since the letter sent by the Club to every Chief Constable asking that the Club might be informed in the event of any automobilists failing to stop when called upon to do so upon the driver of a restive horse or a police constable holding up his hand, not a single instance of the offence had been reported by Chief Constables to the Club. The Secretary further pointed out that the number of motor drivers who refuse to stop when called upon to do so is extremely small, and that the numbering of vehicles would not assist the police in identifying offenders, as a driver who would ignore a signal to stop would not hesitate to cover his number when guilty of an offence. The members of the County Council were then given drives through the traffic of London in a wagonette lent by the Motor Manufacturing Company, and in Mr. Alfred Harmsworth's 6 h.p. Daimler. A most unfortunate accident occurred in connection with the former vehicle, although the occupants of the vehicle all agreed that the driver of the car was in no way to blame. A spirited horse being driven by Lord Chelmsford took fright at the automobile and bolted. Lord Chelmsford was thrown out, the trap was upset and broken to pieces, and finally the horse jumped the park railings and was thus pulled up by the remains of the trap remaining on one side of the paling whilst the horse was on the other side.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

Demonstration at Gloucester.

REPRESENTATIONS having been made to the Committee of the Automobile Club that there was a strong feeling against motor-vehicles in the county of Gloucester, it has been decided to invite members of the Highways Committee of the Gloucester County Council to take drives in motor-vehicles, which will be in attendance at the Shire Hall, Gloucester, at 2 p.m. on Saturday, the 27th inst.

Another Demonstration in June.

A BIG demonstration before County Councillors is being organised by the Automobile Club to take place on the three days immediately after Derby Day, viz., Thursday, June 6th, Friday, June 7th, and Saturday, June 8th. The demonstrations will take the form of drives from the Club, starting at 11 o'clock, to Richmond Park and to Sheen House Club, where lunch will be served. After lunch there will be an informal discussion on automobile regulations, and subsequently the Councillors will be given further drives and eventually taken back to London.

A LOCOMOBILE ON A STIFF GRADE.

The Bournemouth Motor Service.

RIDING into Bournemouth on Bank Holiday it was impossible to fail to observe the crowds waiting for the motor-cars as they arrived from their various points and to note the rush of passengers to secure seats. There were seven wagonettes in use and we learnt that the great total of 2,460 passengers were carried during the day, the total receipts for the seven cars being roundly £26—one car alone earning £4 9s. 10d. There is no doubt the Bournemouth cars are extremely popular and that the service is well managed. Although the cars are known by the popular name of the "Boscombe buzzers" yet they are extremely silent running. Useful information to motoring visitors will be the knowledge that the depot is in charge of a first-class fitter, who can be relied upon to do all sorts of repairs satisfactorily. In our instance a new third speed gear had to be fitted and a complete overhauling of the car indulged in.

The Anti-Skidding Tire Competition.

THE Anti-Skidding Tire Competition, held in the old velodrome of Courbevoie, on Thursday, 28th ult., under the auspices of the Union Automobile de France, provided an interesting and instructive exhibition to a large assembly. There were five entries, and with one exception the competitors put in an appearance. The cars were tested (1) on the old racing track, which had been specially watered and made slippery; (2) on the pavements of certain adjacent streets, which were well greased and covered with a light mantle of frost; (3) on an incline sufficiently steep to test the stopping powers of the cars. The contest resulted in a tie for the first prize of 200fr. between MM. Chameroi and Le Grand. A consolation prize of 50fr. was awarded M. Lucas, who obtained the second place, whilst M. Menier, who came third, received special mention.

Control Contests at the Crystal Palace.

WITH the object of demonstrating the perfect control of drivers over their motor-cars, the English Motor Club has arranged to hold a series of control contests at the Crystal Palace on Saturday, the 27th inst. The course will extend over a distance of about two miles and will include hills of a gradient of one in ten, the roads varying in width from fifty to fifteen feet. About six places will be fixed at which the cars will have to be brought to a standstill within a space of about twenty feet. To prevent the unfairness of pitting a small type of car against the racing cycle, the competitions will be divided into the following classes:—(a) Motor-bicycles (riders to dismount in controls); (b) motor-cycles with three or more wheels which can be assisted by pedalling (free engines barred); (c), motor-cycles with free engines; (d) cars driven by ladies; (e) voiturettes under 6 h.p.; (f) cars over 6 h.p. and under 12 h.p.; (g) cars over 12 h.p.; (h) racing cars; (i) steam cars; (k) electric cars. Whilst racing and hill-climbing tests are very valuable in their way, they hardly cover the point as to the practical use and utility of the average motor-car as supplied to and driven by the public. For this purpose, as already stated, a course has been marked out over the Crystal Palace grounds which will test the cars over roads of the same character as those met with in every day driving. It is obvious that whilst the distance that has to be traversed is, comparatively speaking, short, the variations in regard to wide and narrow roads, declines, inclines, etc., will supply an extremely good test of the capacity of the motor vehicles competing.

Electrical Cabs in New York.

THROUGH the courtesy of the New York Electric Vehicle Transportation Company, the New York Electrical Society held its 213th meeting at the new Main Station, Eighth Avenue and 49th Street, New York, on the 27th ult., when Mr. G. Herbert Condict, consulting engineer of the company and of the Electric Vehicle Company, delivered a brief address on "Automobiles in New York City." After the address the visitors were conducted through the station, which is claimed to be the largest of its kind in the world. The method of generating the current, charging the batteries, inserting and removing batteries from the vehicles, the inspection and dispatch of vehicles, and the whole routine of the vast system of handling daily hundreds of electric automobiles, was illustrated in full operation.

New Regulations at Havre.

THE following circular issued by the Mayor of Havre has caused great indignation in French motor-car circles, and has been the subject of a strongly-worded appeal to the Minister of Works from the Union Automobile de France. This circular states (1) that in turning corners and in the squares and on the quays the speed of a motor-car is not to exceed that of a horse going at a walking pace; (2) that no car shall be allowed in the

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

town unless it carries a metal plate bearing a certain number in Arabic figures at least 15 centimetres high and 3 centimetres broad; (3) that this plate shall be affixed to a panel at the back of the car, and in the absence of the panel shall be placed in a conspicuous position behind; (4) that before a motor-car can be run in the town the permission of the mayor must be first obtained. Vehicles only passing through or staying in the town for not less than three days need not obtain the permission of the mayor, but the drivers must first obtain a numbered card at the municipal offices. English motorists passing through Havre would do well to make a note of the new regulations in that port.

A Motor-Car Service for Scarborough.

PROMISES of capital in excess of the sum considered necessary for the establishment of a syndicate for the introduction of motor-cars into Scarborough have been received by the promoters, Messrs. Walker and Hutton. A company, with a capital of £2,500, is to be formed forthwith, and operations will be commenced by the running of three cars, which are expected to be ready for use before the end of July. The vehicles will be provided with two distinct bodies, one for summer and one for winter use. The summer body will be in the form of a char-à-banc, constructed to carry twelve passengers and a driver and conductor. The winter body will be an improved roomy omnibus. The motors will be of 13 h.p., and capable of propelling the car up steep gradients with heavy loads. It is contemplated to utilise the char-à-banc during the summer season for runs to Hackness, Filey, and other places during a portion of the day. During the winter months the cars will be converted into motor omnibuses and used for a regular public service in those districts that furnish the largest traffic.

A Novel Challenge Cup Race.

A CHALLENGE-CUP race for voiturettes for the benefit of manufacturers is being organised by the *Auto-Vélo*. It will be held a little before the Paris-Bordeaux race in June, and each competitor will be required to run three vehicles of the same make. The following are the rules:—(1) The race shall be held annually over a distance of 200 kilometres; (2) Every competitor must run three vehicles; (3) Classification will be determined by adding together the time taken by the three vehicles entered in completing the course; (4) Eight hours is allowed to complete the distance, and any time over that period will be reckoned as twelve hours; (5) The cup shall go to the competitor whose three vehicles shall have completed the course in the shortest time; (6) The entrance fee is 20 francs for each vehicle; (7) Each vehicle must contain seating accommodation for two passengers side by side, be without pedals, and weigh not more than 13 cwt.

A Lecture at Bolton.

UNDER the auspices of the Technical Instruction Committee of the Bolton Town Council, a lecture was recently delivered in the Mawdsley Street Technical School, to a large audience, on the subject of "Motor-Cars; Past, Present, and Future," by Mr. E. Shrapnell Smith, hon. secretary of the Liverpool Self-Propelled Traffic Association. In the course of his lecture Mr. Smith alluded to the Lancashire and Yorkshire Railway Company recently purchasing a motor-wagon for the conveyance of goods, and used in Liverpool so satisfactorily that he (the lecturer) believed they were about to construct others at their locomotive works at Horwich. Mr. Smith also incidentally alluded to an interview which had taken place between himself and Councillor E. P. Greenhalgh and Mr. John Stewart, Superintendent of Scavenging and Manager of the Sewage Works under the Bolton Corporation, at Glasgow, some time ago, in reference to motor locomotion. In proposing a vote of thanks to Mr. Smith, Councillor E. P. Greenhalgh, J.P., said that about eighteen months ago he and Mr. Stewart were on a deputation to Glasgow, and they were much interested and impressed by

what Mr. Smith had shown them. His (Mr. Greenhalgh's) idea was that the motor system might very well be introduced by the Bolton Corporation, especially in regard to road-sweeping machines and other vehicles in the scavenging department, and he should try and induce the Committee to adopt it to some extent. The wear and tear and cost of horse power was something immense, and he thought much saving might be effected by the change.

Motor-Car Service for Southampton.

AT last the Southampton Borough Council have decided to purchase motor-cars, and for this purpose a sum of £1,600 was voted at a recent meeting of the Council. It has taken the magnates of this far-famed naval port a long time to arrive at a final decision, and even at the present there are some who regard the expenditure as unnecessary, and who look upon the motor-cars as a future white elephant to the town. Fortunately the pessimists are in a minority, and it can only be hoped that in a short time they will change their views on the matter.

TWO JUVENILE MOTORISTS.

A Steam Bus Service in the Midlands.

THE Potteries Electric Traction Company have during the Easter holidays been running some steam automobiles for the conveyance of passengers between Newcastle-under-Lyme and Trent Vale, a connection being thus established with the Newcastle and Trent Vale termini of the electric tramways. The automobiles have been largely patronised, and a good number of people have been thus enabled to visit Trentham Park—the seat of the Duke and Duchess of Sutherland.

An Automobile Market in Ireland.

THE directors of certain Austrian railway companies are negotiating for the acquisition of an automobile to be driven by petrol on the railway lines. The first experiment will be made on a section of the Bohemian line. Two other Austrian companies have also decided to try the experiment. Mr. J. F. Maxwell, writing from Ireland, points out the possibilities of such an arrangement in that country for the carrying of mails and passengers. "There are hundreds of miles of 3 ft. gauge lines in Ireland," he says. Already American capitalists are issuing circulars on the subject, whilst the English traders have done nothing in the matter.

The Yorkshire Automobile Club.

ABOUT a dozen motor-cars assembled in the City Square, Leeds, on Good Friday, for the first run of the Yorkshire Automobile Club. The destination was Ripon, *via* Headingley and Harrogate. At the latter place luncheon was partaken of, and after a good run Ripon was reached. The return journey was made by the same route. The vehicles included a Mytholm car, a Dougill four-seated car, a De Dion voiturette, two De Dion tricycles, a Locomobile steam-car, two Royal Enfield quadricycles, a Mors 8 h.p. car, an Eadie tricycle, a Korte-Atkinson tricycle, and a Marot-Gardon quadricycle. On Monday last a run to Bolton Woods was enjoyed.

Starting from the Seat.

THE necessity of getting out of the car and turning the handle once, twice or more when restarting the engine of a petrol vehicle has often been pointed out as a serious objection by parties investigating the different motive powers, and means of avoiding this operation have been studied by many manufacturers of petrol vehicles. The arrangement usually adopted to overcome this difficulty is a lever operated by the driver from the seat, and connecting with the engine shaft by a ratchet device. The advantages of starting the motor by a lever or other device near the seat, and thus obviate getting out of the car when a stop has to be made to allow unruly horses to pass, etc., would seem to be obvious, yet there is a difference of opinion among *chauffeurs* as to the advisability of such devices, or at least as to the advisability of relying entirely on them. The great question is whether the starting-from-the-seat device will be a convenience to the operator. This, we think, should be answered in the affirmative if the device is well worked out. In touring on country roads it is a very frequent occurrence to encounter shying horses which cannot be made to pass a motor-car with the motor running. Stopping the motor would ordinarily require the motorist or his man to leave his seat, take the crank from the tool box, or other place in which it is kept, and start the motor. If the motor could be started from the seat much trouble might be saved in such cases. If there is anything out of order on the motor, it cannot be started any more with the handle than with the hand or foot lever or other device near the seat.

Motor-Cars for Military Purposes.

THE writer of the Volunteer notes in the *Daily Telegraph* considers that in times of peace "There are few spectacles more exhilarating than the dashing teams and guns, whether in the arena of the Agricultural Hall at Islington or on the plains of Salisbury, but we live in a utilitarian age, when the fittest only are allowed to survive. During the present war the road-engines sent out to South Africa from Aldershot have done splendid service, and it is quite possible that a motor may be devised capable of drawing a 15-pounder field-gun over the rugged country lately occupied by the Boer Republics. But the experimental stages are still far from complete, and the horse will probably be relied upon for the rest of the present year. Lord Roberts would have sacrificed a great deal at Poplar Grove for the possession of such machines as our foreign friends claim to have constructed. All the Boers, some 10,000 in number, were in full retreat, but our horses were too tired to take advantage of the fruits of victory, and so the enemy were allowed to escape. For the most part the country was plain and even, and would have afforded abundant scope for any military automobile worthy of the name."

A THIRCE sounding whistle as a signal for automobiles has been devised by Messrs. Colle and Ackermann, of Wiesbaden, Germany. The whistle, sounding three times in succession, is actuated by a hand or foot lever, and is operated by utilising part of the consumed gases of the engine.

AN AMERICAN CHAUFFEUR'S TOUR IN EUROPE.

D R. J. GRANT LYMAN, a prominent member of the Automobile Club of America, writes to an American contemporary regarding his recent automobile tour in France and a portion of England, as follows:—"In some paper or magazine devoted to sports and travels I read last summer the account of an automobile trip taken in France by Mr. Poultney Bigelow, one of our pioneer automobilists, and as I was just entering the ranks of motor enthusiasts myself, I took a peculiar interest in his experience. We were in Paris at the time awaiting the completion of my Panhard machine, which was to be christened with a trip through the glorious wine country of France. I had heard too much of the erratic and uncertain manœuvres of automobiles to expect anything different in my own experience, and it was with the full expectancy of encountering all the annoyances an automobilist is subject to that I took the wheel in my hands on the morning of August 15th, preparatory to leaving Paris. In spite of every effort to make an early start, it was half past ten before everything was in readiness and the necessary luggage piled into the back of the car. It was under the curious gaze of a crowd of passing pedestrians and hotel porters that the start was made on the slippery rise of the Champs Elysées, and the machine careened and waltzed around as if it were on roller skates, the rubber tires slipping and sliding over the freshly-sprinkled asphalt till it seemed as if we should turn over as a starter. However, after a time it struck a dry spot, and righting itself sped down the avenue and through the boulevards till the city gates were reached.

"It was a fête day, and the streets were deserted by the traffic which ordinarily makes the crossing of the town most tedious and unpleasant. Our guide was a book published by the Automobile Club of France, and a most complete little work it was, outlining perfectly the routes, stating where petrol could be purchased, indicating the best hotels, and with careful parentheses foretelling steep hills and dangerous places. As soon as the gates were passed and we had left behind the immediate environs, we struck into one of those unsurpassed roads for which France is famous, and which makes touring in that country a joy for ever. Under highest speed little towns and villages were quickly left behind, and it was most gratifying to notice that peculiar feature of even the more pretentious settlements—the totally deserted streets and apparently untenanted condition of the villages. This of course enabled us to keep up full speed without the annoying necessity of putting on the brakes for obstacles. The most serious obstructions we had to encounter were occasional herds of sheep, which seemed to have a decided penchant for the middle of the road, and I am quite sure that at least one of their herders had mutton for dinner the day after we passed through.

Nothing in the least eventful happened on our trip. It was devoid of accidents and the interesting annoyances which usually come to strike upon the sympathetic cord of experience of kindred automobile spirits. Our fleeting visit to Reims, where we visited the prodigious wine caves of Pommery and Greno, sampling some of their choicest vintages, and a night spent in the Chateau d'Ardennes, formerly a summer home of the sporting King of the Belgians, were among the pleasant features of the trip, the most unpleasant part of which was the almost impassable condition of the roads from Namur to Brussels, which gave us a terrible shaking up and proved an excellent test to the strength of the machines and durability of the motor.

"Shipping our car from Ostend to Dover, we made the trip to London in a trifle over four hours, in spite of the thickly scattered villages. We sampled some of the British aversion to everything French in frequent salutations from workmen passed on the road, in which derisive jests were made about the machine and the land of its birth. However, these were quickly left behind, and we reached London in time for lunch, enthusiastic devotees of the sport of automobilizing.

THE Automobile Club of America will hold its annual dinner in New York on the 18th inst.

AUTOMOBILE CLUB'S EASTER TOUR.

THE new arrangement of members writing direct to the hotels in place of booking through the Club Secretary, left those who intended participating in the Easter tour of the Club somewhat in the dark as to who and how many intended risking the uncertainty of the weather for the opening tour of the season. Consequently the few cars starting from the Club on Thursday last week at the appointed

GETTING READY AT WHITEHALL.

hour did not look as if the tour would be largely attended, and therefore it was an agreeable surprise to find such a large and representative muster in Salisbury on Good Friday, more than twenty cars being in the spacious and convenient yard of the White Hart Hotel at one time. A goodly company had assembled, as a matter of fact, at Winchester on Thursday, but the majority of cars were driven straight through

A NEW ORLEANS STARTS.

from London to Salisbury, the roads being in fair condition, although a high wind gave one or two member troubles with the burners of their motors.

Good Friday opened dismally enough, the rain falling continuously till after lunch—so very few members were able to take advantage of the Hon. John Scott Montague's invitation to visit Beaulieu, the journey after lunch from Lyndhurst being quite

risky enough in the uncertain state of the elements. For ourselves we had made our headquarters at the "White Hart," Salisbury, an hotel we have frequently stayed at and always found most comfortable. In the afternoon we plucked up sufficient courage to proceed for a few miles on to the Lyndhurst road, where, about a dozen miles out, we met Earl Russell and party on his American car. The vehicle was going well but steaming visibly. Other cars soon came along, including Mr. Pearce and friend on a 9 h.p. Napier; Mr. and Mrs. Richardson on a Daimler tonneau; Mr. and Mrs. Manville on a Daimler; Mr. and Mrs. Howard on a Marshall car; the Mr. and Miss Keneally's on a new 12 h.p. Delahaye; Mr. and Mrs. Owers, and Mr. and Mrs. Estcourt, on Daimlers, both with Estcourt coolers; Dr. Aldridge on a Benz; Mr. Pilcher and friends on a Daimler; Mr. Jarrott and Mr. Cecil Edge, on the 16 h.p. Napier; Mr. Johnson and Mr. Bruce, on a Darracq voiturette; Mr. Astell and Mr. Freeston, on a new gear-driven voiturette, with a two-cylinder engine of 7 h.p., a most serviceable looking car and a very fine hill climber; Mr. Willoughby, on a New Orleans; Mr. and Mrs. Edmunds, with party of seven, on a Daimler, recently fitted with a new 9 h.p. motor; Mr. Bird, junior, and party on a 12 h.p. French Panhard; Mr. Campbell Swinton on a motor-bicycle; Mr. Gorham and Mr. Claude Crompton on a new De Dion voiturette; and Mr. R. E. Crompton on a safety bicycle. Ultimately there was a very fine collection of over twenty cars in the stable yard.

The several days' stay at Salisbury proved most enjoyable, members touring by themselves in various directions—all returning to headquarters in the evening, when a party of over fifty sat down to dinner. On Monday some of the members returned to town. Mr. Bird drove his 12 h.p. Panhard as far as Basingstoke in order to give seats to Mr. Staplee Firth and Mr. W. J. Crampton. From Basingstoke these gentlemen were given seats in other vehicles, whilst Mr. Bird proceeded to Birmingham, and arrived there after having made a "non-stop absolute" run from Basingstoke to Birmingham. Several of the members, ourselves included, continued the tour to Bournemouth. The tour was voted a most enjoyable one, the system of having one headquarters for the Club for the time being much appreciated, and the new Tours Committee is to be congratulated on its initial success.

AFTER a whole year spent in the law's delays, judgment has at length been delivered by the Versailles Correctional Court in the case of the motor-cyclist Dorel, who, by turning at full speed near the Croix de Noailles during the Paris-Roubaix race, last year, nearly killed Mme. Bos, wife of the Deputy, and injured three other persons. It will be remembered that this accident led to a campaign against automobile races. Dorel was condemned to one month's imprisonment, subject to application of the First Offenders' Law, 100fr. fine, and damages; 15,000fr. to M. Charles Bos, 1,000fr. to Martin (the motor-cyclist, whom the defendant threw from his machine), 1,000fr. to M. Biele, and 200fr. to M. Goonstadt.

THE Munich Postal Department is experimenting with an electric tricycle built by Messrs. Schuckert and Co., of Nuremberg, the machine to cover during each trip a distance of from four to four and a-half miles, the trials being intended to determine whether the vehicle can compete with the pedal-propelled tricycles now in use. The problem was, therefore, to produce a vehicle which would combine low cost of operation with minimum maintenance. The vehicle frame is built up of steel tubes; the battery is placed very low, between the rear wheels, in order to insure perfect stability. The weight of the vehicle is 840 lbs., and it can carry a load of 350 to 410 lbs. The maximum speed is ten miles an hour. The battery consists of twenty-four Tudor cells of eighteen ampère-hour capacity, and the mean discharge pressure is forty-five volts. A single series motor of 1 h.p. normal capacity is used. The load of the motor on level streets is about 7 h.p. The controller has five positions for forward motion, one stopping, two braking, and two reverse positions. The current consumption when the vehicle is loaded is sixty-five watt-hours per kilomètre (104 watt-hours per mile).

THE "HUDD" STARTING VALVE.

THE Hudd Syndicate, of 27, Fumival Street, E.C., to whose sparking plug reference was made in a recent issue, has now introduced what may be described as an automatic starting valve. The device, which replaces the compression cock, is a means of rapidly opening and closing the compression, so alternately easing the compression and holding the full force of the explosion. When the motor is started with the compression open in the usual manner, the mixture drawn in by the suction stroke from the carburettor is altered by the air also drawn in through the compression cock. When the compression is effected and the explosion is effected, the full force of the explosion is lost by leakage through the open compression cock, several attempts having often to be made to start in this manner. Occasionally it happens that after the compression tap is closed explosions cannot be made, although they could be obtained before the compression tap was closed. The "Hudd" starting valve is designed to overcome this difficulty and to automatically ease the compression and immediately offer full resistance to the explosion.

FIG. 1.

FIG. 2.

On the plug B being turned and the fly-wheel (or in the case of a tricycle, the pedals) being revolved, the explosion mixture is drawn into the cylinder as usual from the carburettor, but the valve A being on its seat on D, prevents air entering through the starting valve, which is in place of the compression cock, as it would through the latter open. On the charge being compressed the weak spring E gives, and reduces the compression by allowing the valve to rise from its seat to a slight extent, discharging the unnecessary explosive mixture through the holes G. On explosion taking place the stronger spring F is compressed and the valve A closes on the upper seating formed on the casing C, and thus prevents any loss of the force of the explosion. In brief, the force of the compression is eased and the force of the explosion maintained. The device should certainly simplify matters a great deal and make starting much easier. It is, of course, entirely automatic.

A MOTOR-CAR repairing depôt has been opened in Clwyd Street, Ruthin, North Wales, by Mr. D. Cushion.

AN automobile race meeting is being arranged to be held at the Hillsgrove Track, Rhode Island, about June 1st. Endeavours will be made to secure the attendance of all the well-known users of motor-vehicle racing machines in America.

THE Panhard and Levassor motor-car which has been ordered by the Rt. Hon. A. J. Balfour will be fitted with a nominal 7 h.p. two-cylinder engine giving 9 h.p. on the brake. The car will be provided with a body of the well-known *tonneau* shape. It is expected that the car will be delivered in June next.

CONTINENTAL NOTES.

By "AUTOMAN."

THE Antwerp exhibition of automobiles, or as it is more correctly styled, "Troisième Salon de l'Automobile, du Cycle et des Sports," will open its doors on the 20th inst., and remains open to the public until the 24th inst. The show which is thus to be held in the commercial metropolis of Belgium is under the patronage of King Leopold, and has, for a president of honour, Prince Albert. It has also, as patrons, the Automobile Clubs of Belgium and also of Antwerp, the Touring Club of Belgium and the Chambre Syndicale de l'Automobile, and the Members of the Committee include the Presidents of the A.C.F. and A.C.B., and Sir David Salomons representing the A.C.G.B. and I. It strikes me as rather an object lesson to us in England to see how united is the effort to push the automobile movement on the Continent, and how much better it would be for us to thus unite our efforts, instead of having irresponsible people getting up shows of their own which can only, if they take place, cause unnecessary waste of time and money to the manufacturers without resulting in any good to the public, whose best interests would be served by attending one good official show, where all the known makes could be seen and tried and compared—and why not under the patronage of the very highest in the land—like the horse shows.

WHILST the Antwerp show is open there will be trials for the record run of one kilometre. The trials will take place on the 21st inst., and are open to any member of the A.C.B., or of any affiliated club. There will be six different classes. 1, Motor-bicycles; 2, water-cooled tricycles; 3, air-cooled tricycles; 4, small cars weighing less than 5 cwt.; 5, small cars weighing from 5 to 10 cwt.; 6, cars weighing more than 10 cwt., and with motors of less than 8 h.p.; 7, cars weighing more than 10 cwt., and with motors of 8 to 16 h.p.; 8, cars weighing more than 10 cwt., and with motors of more than 16 h.p.; 9, large and small cars, electrical and combined electrical and petrol; 10, large and small steam-cars. The trials will take place on a good wide and straight military road, in excellent condition, between Mortsel (Vieux-Dieu) and Borsbeek. The entries, which must be accompanied by a fee of 5 francs for each vehicle, close on the 18th inst., and should be sent to the Automobile Club of Antwerp, 40, Grand Place, Antwerp.

THE Dutch Automobile Club has just held its general meeting at the Hotel de l'Europe in Amsterdam, and has decided to make a public tour round Holland, after the style of the English 1,000-mile trial. There will be altogether four days' running, covering a distance of 331 miles, the longest distance covered in one day being 114 miles. The time of departure and arrival will be fixed so that an average speed of about twelve miles an hour will be quite sufficient to cover the distance in the time allowed. All repairs and work of any kind on the competing cars must be accomplished during the three hours which immediately follow official time of arrival and during the three hours which immediately precede the official time of departure. The trial is to be held in June next, and there are already seventy entries.

THREE Belgian automobilists have just accomplished a very interesting and important tour on three 6 h.p. Belgian Daimlers. Starting from Charleroi three weeks ago they returned on the 30th of March, having covered successfully 2,500 miles, going right down to the Mediterranean *via* Chalons-sur-Marne, Dijon, Aix-les-Bains, Grenoble, and Nice, and returning *via* Saint Raphael, Orange, Saint Etienne, Vichy, Fontainebleau, and Compiègne. Crossing the mountain pass of Croix Haute was particularly difficult owing to the snow. The road had not been cleared and no horse-drawn vehicle had been able to pass since the fall of snow. The accidents of the whole trip are to be summed up in four punctures, and on the last day a distance of 105 miles was covered, from Compiègne to Charleroi. This little 6 h.p. car is most satisfactory in its running, as I have

had personally occasion to know. I believe I was the first to drive one in England—during the last winter I drove one from Harwich to London for a friend, who has since had many pleasant hours and covered some thousands of miles on it.

It is now possible for English tourists—members of the Automobile Club of Great Britain and Ireland—to tour in Belgium, without paying duty on their motor-cars. The A.C.G.B. and I. have only to apply to the A.C.B. and to sign a contract with the latter Club, and permits will be furnished for any members who wish to visit Belgium with their automobiles. The journey from London to Harwich (about fifty miles) is very interesting, and the road is good when once the suburbs of London are cleared. At Harwich the crossing to Antwerp is both convenient and economical; the boats leave at 10.30 p.m., and Antwerp is reached at 9 a.m. the next morning, comfortable cabins and a good breakfast being available on board—the former without extra charge. Should any English enthusiast wish to compete in the speed trials on the 21st inst., entry should be made at once. Antwerp is a most interesting city to visit, being the scene of the labours of Rubens. There is a good road from Antwerp to Brussels, where the beauties of the Boulevards and the Parks are well worth a visit, covered as they will be by the end of April with the fresh green leaves of the spring-time. Any speed competitors should note that last year the records of the world were beaten in Belgium by M. Jenatzy with an oil car, who did the kilomètre at the rate of fifty-nine miles an hour, and by Miesse with a steam car at forty-five miles an hour.

THE Baron Pierre de Crawhez, famous for his pioneer tour in the Sahara, has just arrived in Brussels with his newly-acquired 24 h.p. Panhard car, for which it is rumoured he has paid £1,400. It is certainly a very fine car and he expresses himself quite satisfied with his purchase. He and his brother have just purchased a house in the Avenue Louise, Brussels, and have converted the garden into an automobile garage.

A PECULIARLY paradoxical incident, which I have not seen reported in any English paper, took place at the Nice races, and was alluded to in an amusing manner in his speech at the final banquet by the Baron de Zuylen, the president of the A.C.F. The incident was in connection with Serpollet, of steam-car fame. Serpollet is the president of the Union Automobile of France, a society which was got up in opposition to the A.C.F. The first thing the U.A.F. did was to issue a manifesto against road racing, and this manifesto was signed by M. Serpollet. There was a counter manifesto issued by the A.C.F., and the result of the crossing of swords might be seen in the prominent position taken in the races by M. Serpollet, who, finding the A.C.F. was too strong for him, had to haul down his colours and compete in road racing under the flag of the A.C.F. So great is the commercial value in France of these road racers that one may say the trade is ruled by them, and it is quite certain that the public profit thereby—because it brings the best makes to the front infallibly.

MICHELIN, continuing what he calls his Monday's in the *Auto-Vélo*, brings forward this week an important point which may have escaped the observation of the great majority of motorists, and will therefore probably be of interest to the readers of the *Journal*. One of the great causes of rapid deterioration of pneumatic tires lies in the fact that the wheels are not always parallel. This has a greater effect than most people would imagine. As a general rule the pneumatics of front wheels last about twice as long as those of the back wheels, this, of course, being accounted for by the fact that the back wheels usually carry nearly twice the weight that the front wheels carry. There have, however, been cases in which a certain make of car used up the tires of the front wheels quicker than those of the back wheels, and on examination it was found that the reason lay in the fact that the wheels were not mounted parallel to each other.

It is easy to see that if, for instance, the front wheels are not parallel to the direction of motion, an enormous amount of friction will be produced from the fact that the front wheels are working in a conical, instead of a cylindrical manner. This excess of friction will result in slowing the car considerably, and also in wearing away the rubber. Most of the manufacturers have now taken steps to prevent this defect, but still a new hand at motoring is sometimes liable, when first he becomes owner of a vehicle, to run into the footpath and knock his wheel a little bit out of truth. It would be well, therefore, now and then to look to this point and make sure that all four wheels are parallel to the line of motion. It is quite easy to do this by the eye, though of course it can also be accomplished by measurement.

SOME AUTOMOBILE CLUBS' BADGES.

THE AUTOMOBILE CLUB OF AMERICA.

THE BELGIAN AUTOMOBILE CLUB.

THE YORKSHIRE AUTOMOBILE CLUB.

THE RHENISH AUTOMOBILE CLUB (MANNHEIM).

THE NICK AUTOMOBILE CLUB.

THE ITALIAN AUTOMOBILE CLUB (MILAN SECTION).

PRINCE DON MIGUEL OF BRAGANZA has ordered a 12 h.p. Panhard similar to that of Princess Hohenlohe.

ON Saturday, the 20th inst., the Automobile Club will hold an afternoon run to Dunstable, dinner being taken at the Sugar Loaf Hotel.

THE Motor Fittings and Engineering Company have removed from Redhill to the Star Foundry, 28, North Road, Brighton.

AN automobile tour from the Canadian cities of Toronto and Hamilton by way of Niagara Falls is being encouraged by the management of the Pan-American Exposition.

DR. FRENCH, of Forfar, has appealed to the Sheriff-Principal against the decision of Sheriff Lee in connection with the action raised by James M'Farlane, cycle and motor-car dealer, Perth, against him for the price of a motor-car.

MESSRS. STANBURY AND Co., of Commutation Row, Liverpool, have sent us copies of a handy little vest-pocket diary they have issued for the use of cyclists and motorists. They can be had with a map of the Liverpool, Manchester, or Leeds districts.

THE other day, at Gainsborough, the toll-keeper on the Trent Bridge had some difficulty in deciding to what class of vehicle a motor-car belonged, but after deliberation he came to the conclusion that it came under the head of "velocipedes," and charged the driver one half-penny only.

A HILL-CLIMBING competition was held a few days ago up the Königstuhl, near Heidelberg, under the auspices of the Rhenish Automobile Club. Between the starting and finishing points there was a rise of over 550ft., which included gradients of about 1 in 6. There were sixteen starters, and of these fourteen finished, the winner being Herr H. Opel, of Russelsheim, who made the journey in 23 minutes.

MOTOR-RACING AT THE CRYSTAL PALACE.

UNDER the auspices of the English Motor Club, a race meeting was held on the track at the Crystal Palace, on Monday last. The hour of starting, one o'clock, was not altogether a convenient one, but this did not prevent a large crowd gathering round the track to witness the events; indeed, the audience was undoubtedly the largest so far seen at a motor-racing meeting in this country. While the races were interesting so far as they went, some disappointment was expressed at the inability to carry out the events as given in the programme, a two-mile

3½ h.p. Soncin motor. Nixon shot away at the start, but was quickly overtaken by Edge, who led to the end of the fifth lap, when Jarrott forged to the front, maintaining his lead to the end and so winning the race in 7 min. 31½ sec., Edge being second and Lewin third. While there was never much doubt as to the result of the race, Jarrott's victory proved very popular with the holiday crowd.

We were next treated to a mile handicap race for cars. Although this was the first race of the kind, so far as we remember, the event was not a particularly interesting one, as there were only three competitors—an 8 h.p. Panhard, driven by C. Jarrott (200 yds.); a 5 h.p. Panhard light car, driven by

THE LOCOMOBILE IN THE MILE SPEED TRIAL.

THE REMAINS OF MR. C. EDGE'S TRICYCLE.

THE START FOR THE FIVE-MILE TRICYCLE RACE.

THE MILE CAR HANDICAP.

voiturette handicap and a pursuit race between Mr. C. Jarrott and Mr. T. Maltby, jun., both on De Dion 10 h.p. Spiders, being cancelled, the latter owing to the non-arrival of Jarrott's machine from France. It was also stated that Mr. S. F. Edge would give an exhibition ride on one of the 70 h.p. Napier cars, but as this vehicle is still "on the stocks," the 16 h.p. car of the same make had to do service for this item. It was not till about 1.30 p.m. that a start was made with the first event—a five-mile scratch race for motor-tricycles. Of the eight entries, four turned up at the starting point—namely, C. Jarrott, 8 h.p. De Dion; Cecil Edge, 6 h.p. De Dion; J. C. Nixon, 6 h.p. De Dion; and F. Guy Lewin, M.M.C. tricycle with

H. J. Lawson, jun. (300 yds.); and an 8 h.p. Mors dog cart, driven by F. F. Wellington's *mecanicien* (310 yds.). The Mors was soon left in the rear, to the amusement of the spectators, Jarrott winning in 2 min. 16 3-5 sec.

A mile handicap for motor-cycles was next on the list. Four competitors started, Jarrott being on scratch mark, Cecil Edge having 120 yds., Lewin 200 yds., and Nixon 300 yds. start. No pedalling was allowed at the start, the riders being pushed off to get the engines in motion. This race was the cause of much excitement, for on the second lap, just as Edge was taking the banking at a good speed, the spindle of the front wheel of his machine broke, with the result that both machine and rider dashed into the fence,

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

breaking it down. Assistance was quickly at hand, but, marvellous to relate, Edge himself was but little the worse for the accident. The machine, however, was a complete wreck, the frame and wheels being twisted out of recognition. Fortunately the other riders were able to keep clear of the spill. The accident, of course, put an end to the race, but after the excitement had subsided, a fresh start was made. Nixon led for the first two laps, but was then passed by Lewin. Jarrott made a bold attempt to get in front, but Lewin came in first in 1 min. 40½ sec.

The next item was a mile race against time by a Locomobile steam car driven by Mr. A. Ginder. This is the first time a car of this type has been seen on the track in this country, and the event created great interest, the smooth and quiet running of the vehicle being much commented upon. We managed to get a snapshot of the car coming down the straight on the last lap. The time for the mile with flying start was 2 min. 7½ sec., or equal to a speed of about 28½ miles per hour.

An attempt by Jarrott to lower the mile tricycle record (1 min. 22½ sec.) held by himself formed the next and last event. The high wind prevailing prevented the attempt resulting successfully, the time for the mile with flying start on Monday being 1 min. 30½ sec. Mr. G. P. Coleman took the times, while Mr. F. F. Wellington acted as judge.

The competitors and friends afterwards lunched together at the Palace, a pleasant hour being thus spent.

A STEAM OMNIBUS FOR SPAIN.

THE accompanying illustration represents a steam motor omnibus which has just been shipped to Spain by Messrs. Julius Harvey and Co., of 11, Queen Victoria Street, London, E.C. The vehicle is designed for fourteen passengers, but of course made to seat as required. that there is a in Spain for Messrs. Julius Co. having their custom steam motor-negotiations are pending for a further supply of motor-vehicles to the same country. We may point out that the cars in question have been designed to be fired with coke, but if preferred they can be made to burn oil fuel.

THE Earl of Portsmouth is one of the latest of the nobility to acquire a motor-car. The Earl and Countess are often out driving in the car at their delightful country seat at Eggesford, Devonshire.

THE London Autocar Company, Ltd., of 182, Gray's Inn Road, W.C., have just got out an abridged illustrated list of motor-cycles, cars, and accessories. Copies may be had for the cost of postage, 2d.

AN interesting article on "Milestones" appeared in a recent issue of the *Field*. The writer pointed out the chaotic state of the positions of the milestones on many of the principal roads of the Kingdom. In particular he mentioned the road running from the Marble Arch to Oxford, *via* Wycombe, as an example of the negligence and inability of the powers that be to grapple with the question.

THERE was a large attendance at the Putney Velodrome on Easter Monday to see the five-mile motor-cycle race. There were six entries, but only the following three started: F. T. Woodman, Putney A.C.; J. H. Booth, Putney A.C.; T. H. Fessier, Essex A.C. Woodman, in the final, beat Booth easily in 10 min. 23½ sec., Fessier retiring. Mr. Mark Mayhew, L.C.C., one of the vice-presidents of the club, was the donor of a five-guinea prize to the winner.

THE MACQUART-VEXIAU MOTOR-BICYCLE.

STILL another motor-bicycle is the Petrocyclette, built by Messrs. Macquart and Vexiau, and lately put on the market by M. E. Arnault, Boulevard Pereire, Paris. The arrangement is much the same as in some other types of bicycles, the motor being fixed inside the frame above the bottom bracket, the power being transmitted to the rear wheel by a chain instead of the belt usually employed. The novelty in the motor, which is of 2 h.p., is the method of air cooling. The cylinder has an air jacket composed of an outer cylinder of copper, with ribs. A funnel is fixed near the top, projecting in the direction in which

the bicycle is travelling, so that a draught created by the forward drive is forced into the jacket, and issues from another aperture at the bottom. The idea is good, but the ribs on the outer cylinder seem a little superfluous unless they are intended to conduct heat from the combustion chamber. The motor shaft is provided with a friction clutch, and the carburettor is of the pulverizer type, in which the petrol is drawn up by suction and mixed with the air as it enters the cylinder. The tank, suspended from the top tube, holds about a gallon of petrol.

THE CREST SPARKING PLUG.

IN our issue of October 20th last we illustrated and briefly described a new sparking plug brought out by the Crest Manufacturing Company, of Cambridgeport, Mass., U.S.A. The plug consists of a shell of steel having a thread at one end to screw into the orifice in the chamber of the motor. Through the shell is a tapered hole in which the insulating cone of a new material is inserted, making a perfect gas-tight joint. Above the shell and fitting around the upper part of the cone is a cup of insulating material. A nut on the metallic stem, which passes through the cone, holds the several parts of the sparking plug together. The binding nut for the wire has a special locking device, while a metallic spring washer is inserted between the cup and nut to take care of changes in expansion. The plug is a radical departure from the type generally in use, and, on account of its form of construction and the special insulating material used, is unaffected by expansion or the intense heat of the motor. Some time ago the Crest Company sent us one of their plugs for trial; it was first tried on a Napier engine and also afterwards on a De Dion motor, on both of which it was found to give capital results. For some time past it has been in use on a new Butler motor with high compression, on which it runs perfectly, the porcelain, or rather the substitute, having also stood very well.

HENRI FARMAN, owing to his not participating in the Mile Race, has been disqualified by the A.C.F. Consequently, although he headed the list in the light car section of the recent speed contest, the prize will not be awarded to him, and furthermore he is debarred for a month from participating in any race.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

CORRESPONDENCE.

MOTOR-CYCLE MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is some little time now since the relative merits of front attachments and trailers were discussed in your columns, and, as I have been experimenting both fore and aft during the past twelve months, I propose to make a few remarks upon the subject with a view to eliciting experiences and opinions of others. When I first began my motor education I had a decided penchant for a trailer rather than for a front attachment, but I was strongly advised against the trailing car by those of wider experience than myself, and, acting upon their advice, I converted my trike into the white elephant known as a quad. Now, I don't think I ever really enjoyed myself upon that quad! I very soon found that it is practically impossible without superhuman effort to start the four-wheeler by the pedals, and I had to resort to the undignified "shove" and sprawl over the machine to do the necessary tap-twiddling. When running without a passenger the quad is a very clumsy and meaningless vehicle, and when freighted the weight is badly distributed for running purposes—in fact, it is very much like trying to swim with a millstone around one's neck. I very soon gave up the quad in disgust, for, in those days, free engines and water-cooled heads were only fitfully dreamed of.

My next experiment was a tandem attachment supplied from France through the Speedwell Motor Company. This little perch is not very inviting at first sight, but friends of mine who have "perched" there declare that it is not at all uncomfortable, and there is no doubt that for fast travelling it forms excellent accommodation for another passenger. I have averaged twenty-two miles per hour over a run of sixty-six miles with this arrangement. The chief disadvantage seems to be the increased wear and tear to tires. There is another point about this contrivance that is worth noticing. Upon a double-bridged trike (such as my own) there is not nearly the amount of leg room available as on a single-bridged one. Moreover, the "Ariel" would seem especially suitable to this form of attachment on account of the forward position of the engine. I hope to sample this before long.

Finally, with regard to trailers, my own opinion is that they are inestimably superior to front attachments. A good 2½ h.p. trike will take very little notice of them, and the motion is far freer and pleasanter than in the case of a quad. Add to this the ease with which they are coupled up and detached—a trailer takes barely one minute to attach, whereas to convert a trike to a quad means half an hour. They are also far less expensive, and far less likely to cause expense. As an instance of the speed qualities of this form of attachment, I may quote a ride of fifty miles I took last week. I had one passenger on my tandem attachment and another one in the trailer behind that, and yet, over a very hilly road, I only shed forth my passengers once, to negotiate a gradient of about 1 in 7. On the level, with three up, we easily ran at the rate of twenty-five miles an hour.—Yours faithfully,

CLAUDE A. P. TRUMAN.

Hon. Sec. R.A.C.

MORE ROOM WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with "C" in his remarks as to the motor-car of the voiturette type. Not only is one's position cramped, but in most cases it is necessary to interlace knees, and there is no place in which to stow anything bigger than a collar-box. When in Paris last autumn I met an English agent to whom I had often expressed my opinion on this subject, and he drew my attention to a car in which these inconveniences were practically non-existent. On inquiry and examination I found it to be a very substantially built car—roomy *tonneau* body, well finished and of excellent appearance, 6 h.p. motor, gear driven, three speeds and reverse. Price exactly the figure last quoted by "C." If this gentleman will send me his address, I will send him any additional particulars in my power.—Yours truly,

F. E. H.

SOLID OR PNEUMATIC TIRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would much like to hear the opinions of your readers on the use of solid or pneumatic tires for a 5 h.p. motor-car weighing about 7cwt. The engine is placed over the front wheels, is of De Dion type, making 800 to 900 revolutions per minute.

I intend to use the car on country and country town roads, for medical work averaging fifteen miles a day, and also for occasional holiday runs. I am predisposed in favour of good solid tires—(1) as being cheaper at first; (2) as being cheaper to maintain; (3) as being less likely to cause delay and trouble.

If your correspondent "C." will write me, I think I can tell him of a car to suit his requirements.—Yours truly,

W. E. ST. L. FINNY.

FUEL FOR MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 30th ult., "Beginner" asks if "ordinary paraffin oil could by any means be used as a make-shift." Even if the motor could be adapted for the use of paraffin oil, I think there would be the greatest difficulty in using it. Some time ago I had the misfortune, when out on a ride on a motor-bicycle, to purchase bad petrol, which I could in no way fire. In consequence I emptied my carburettor and spare tank, and stored a gallon of benzoline. On this I rode a distance of fifty miles without a stop.

Trusting that benzoline may be of service to "Beginner" or others in the absence of petrol,—Yours truly,

J. SCRIVENER.

MOTOR-CARS FOR LIGHT RAILWAYS

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could you, or any of your readers, give me any information about the use of motor-cars worked by petrol on the railways of Belgium or France? There are hundreds of miles of 3 ft. gauge lines in Ireland, and it seems to me there is an opening for the use of motor-vehicles for the carriage of mails and passengers. If English makers do not take up the question the need will be supplied by Americans, who have begun issuing circulars on the subject.—Yours truly,

J. F. MAXWELL.

STRAPS FOR MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been using Collan oil on my belt on my Werner motor-bicycle for the last two months, and I find it greatly increases the durability of the leather, prevents slipping, and renders it impervious to water. I should like to state for the benefit of fellow riders that it can be obtained from Mr. Ch. Hanson, 6 and 7, Long Lane, Aldersgate Street, E.C.—Yours truly,

JOHN J. LEONARD.

ACCUMULATOR AND DRY BATTERY PUZZLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent Mr. Augustus Kent appears to have had trouble with accumulators when used on his car, and to say exactly what is the cause of these would necessitate an examination of the cells and full particulars of the treatment they have received since they left the maker's hands. No. 1 battery appears to have sulphated, possibly on the surface of the grid, which complaint is greatly intensified by short circuiting on a low resistance ammeter. This practice I cannot too strongly deprecate with all types of accumulators.

No. 2 battery seems to have suffered from the same complaint in a much greater degree, so much so that but a small proportion of the active material remains unconverted into white sulphate. In this case the cells will gas freely after a short charge, the capacity being much reduced. This white sulphate

is very difficult to reduce, but this can be done in practice by special treatment and prolonged charging.

Should your correspondent care to communicate with me through the Editor I shall be glad to be of assistance.

Yours truly,

SPROCKET.

CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The decision of the Town Council of Chester, reported in your last issue, is, I anticipate, the result of my correspondence with the engineers of the various electric light supply stations throughout the United Kingdom to obtain information for my "Automobilists' Guide," which will make its appearance in a few days.

It may interest your readers to know that the engineers of over 75 per cent. of the electric light supply stations giving a low pressure or continuous current have signified their willingness to charge accumulators, and that the engineers of many of the stations producing a high tension or alternating current have expressed their intention to lay down the necessary plant to enable them to charge accumulators when the demand is sufficient to justify the expenditure.

Generally the result of my enquiries is:—First, that up to the present there has been but little demand for charging current; and secondly, that the various corporations and companies are alive to the fact that in the near future the charging of accumulators for electrically-propelled motor-vehicles may become a profitable source of income.—Yours truly,

ROBERT E. PHILLIPS.

THE ASTER MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just noticed a misprint in my letter under the above heading, published in your issue of March 30th, which I should be obliged if you would kindly correct. The sentence runs: "Previous to possessing this (Aster) tricycle, I had two De Dion trikes, so I am able to compare them with the Aster, a comparison that by no means goes in favour of the latter." I wrote: "A comparison which by no means goes in favour of the former (the De Dions)."

The latest success the Aster motor has won was the great Nice-Salon-Nice race, the principal event of the famous Nice week. The competing motor-tricycles were two 6 h.p. Perfecta-Soncins, three 8 h.p. De Dions, and one solitary 8 h.p. Gladiator-Aster. This solitary Aster tricycle, ridden by Demester, came in a very good first, in the motor-cycle class. It was second of all the competing vehicles, being only just beaten by a 52 h.p. German Daimler, with which it ran neck and neck for three-quarters of the way.—Yours truly,

LEOPOLD CANNING.

AN Englishman in Paris writing with reference to "Automan's" continental notes of last week, remarks that although the Hon. C. S. Rolls was undoubtedly one of the first Englishmen to be authorised by examination to drive a Panhard car in France, the first English holder of a "certificat de capacité" was probably the Hon. Evelyn Ellis, whose automobile experiences date back a long time.

THE latest addition to the ranks of French motorists is M. Casimir Perier, the ex-President, who has lately acquired a 12 h.p. car.

THE Provincial Cup Race organised by the Federation Automobile du Sud-Est is to be run off on Sunday next over the Salon-Avignon-Salon route, a distance of 180 kilomètres. The course is open for cars, voiturettes, and motor-cycles.

LA COMMISSION DES SERVICES EXTERIEURS of the Automobile Club de France has just published *L'Annuaire de Route* for 1901. It contains a complete list of hotels and repairers in France recommended by the A.C.F., and the names of those who store petrol.

THE PIEPER LIGHT CAR.

WE are this week able to publish an illustration of the light car lately brought out by the Société des Etablissements Pieper of Liège. The vehicle is not a voiturette, but really a small car of robust construction and with a long wheel base. The frame, which is constructed of channel steel and wood, is built low and carries the whole of the motor and transmission gear, so that any type of body can be fitted, the illustration showing a *tonneau*. The car is being made in two types—one fitted with a single-cylinder engine of 6 h.p., and one with a two-cylinder motor of 8 h.p. provided with governor. The engine is located under a bonnet in the fore part of the frame; the ignition is electrical, and the cylinders are of course water-jacketed. A pump maintains the water circulation, in connection with which a radiating coil is fitted in the front of the bonnet. Three forward speeds and one reverse are provided, all controlled by one lever at the right of the driver. There is the usual clutch between the engine and the intermediary shaft actuated by a foot pedal. From the change-speed gear box the power is transmitted by bevel gearing to a differential counter-shaft, this being connected to the rear road wheels by a duplicate pair of sprocket wheels and chains. Steering is controlled by an irreversible hand-wheel mounted on an inclined standard, around which are grouped the

various control handles. The road wheels are of wood, the front pair being shod with 65 mm. pneumatic tires, and the rear pair with 80 mm. ditto. A second foot pedal actuates both the clutch and a double-acting brake on the differential shaft, while a hand lever at the side controls band brakes on drums attached to the hubs of each of the rear road wheels. The 6-h.p. car weighs between 8 and 9 cwt., and can attain a speed of from 30 to 45 kilomètres per hour, while the 8 h.p. car weighs between 11 and 12 cwt., its maximum speed ranging from 45 to 60 kilomètres.

THE Honourable Leopold Canning, J.P., has been touring in France on a 5 h.p. Century motor-tandem.

A RACE for light cars of not more than 7 h.p. will be run off on Sunday next, under the auspices of the Swiss Automobile Club.

PLANS are being prepared for a speed contest from Cleveland to Buffalo. The distance between the two cities is figured at about 195 miles, the roads being principally gravel or macadam, gently rolling, with few steep hills.

CONSIDERABLE interest was shown last week in French motoring circles in the long-distance run made by M. Garcin on an electrical car weighing complete only 14 cwt. With one charge of the battery, consisting of a set of Bouquet-Garcin-Schivré accumulators having a capacity of 120 ampère-hours and weighing 6½ cwt., he was able to cover a distance of eighty-five miles, his time for the trip being 6 hr. 32 min. 55 sec.

CHAINS FOR MOTOR-CARS.

THERE are few cars into whose anatomy chains do not enter somewhat, but there are fewer still in which such chains are run under satisfactory conditions for efficiency and durability. To this may be attributed the occasional attempts to break away from the chain tradition and supply their place by bevel gear, shafts, and other substitutes, which can never exceed, even if they equal, the efficiency of a perfect chain. What other form of gearing would stand the conditions of a driving-chain, exposed to road grit in dry weather, covered with mud in wet, and expected to exist on a small amount of lubricant that a more or less regular but superficial application of oil or grease can supply, supplemented in more careful hands by an infrequent soaking in melted tallow? If gear-cases had not been introduced on cycles, there is little doubt that some chainless gear would have become almost universal, not on account of any mechanical superiority, but because it was protected from dirt; and a similar cause acts in the same way with regard to cars. There is no reason, however, why such a silent, efficient and convenient transmission as is afforded by chains should not be used to an even greater extent if properly protected, and, in fact, several cars have now appeared in which the whole gearing consists of them.

The most casual survey of modern automobiles shows a perfectly astonishing diversity of practice with regard to the proportions of driving chains, and a few remarks on the principles

FIG. 1.

FIG. 2.

involved may not be out of place in this connection. In the first place, the form of chain has to be considered, and though there is little to choose in efficiency between different forms when lubricated, the roller chain is probably preferable where, as is usually the case, lubrication is insufficient, both as causing less wear on the teeth and as having, in the same size, more ample dimensions of wearing surfaces, though the lower price of the block chain may have compensating advantages. The Renold laminated chain, though theoretically good, is hardly satisfactory under road conditions, needing to be kept tight, and offering much lodgment to grit, and it is little used for this purpose.

As to the size to be employed, in which such widely different practice is evident, there is little necessity for fixing this on theoretical grounds of power to be transmitted, where exposed chains are in question. A chain becomes useless when so stretched as to cease to run smoothly, and to show a tendency to jump the teeth, and as this stretch is almost entirely due to wear on the rivets, the only way to diminish it is to have them excessively large and long as far as mere power-transmission is concerned. For this reason a large chain is preferable, as having a much longer life, while thickness in the side-plates is needed, not for tensional strength, but to provide a firm attachment for the sleeves in which the rivets work.

Another point about chain gearing is that a chain can never

be in true pitch with its sprocket. A pair of spur gears tend—to a certain extent—to wear into a good running fit with each other, but a chain, if made to fit its sprocket when new, does not continue to do so a moment after being made, as wear at once throws it out. This being so, it must be put up with, and involves the consequence that a chain can only drive with one tooth at a time, supplemented by any frictional “bite” the other links may have on the base of the tooth interspaces. If the chain be made to fit these accurately, as in Fig. 1 (taking a roller chain in illustration), it is obvious that the least stretch will cause the rollers AA to begin to ride on the teeth as at BB. If, however, the teeth be made narrow compared with the spaces between the rollers, a considerable stretch may occur without this taking place. The roller interspaces, then, should be long, to permit the teeth to have some play in them, while retaining sufficient strength, as shown in Fig. 2.

In order that the driving sprocket may receive each incoming link of the chain without its having to slide up the tooth-face, it should be of a somewhat longer pitch than its chain, the result being that the bottom tooth takes the drive, this being permitted by the tooth-play shown in Fig. 2. This difference, of course, gradually disappears as the chain stretches. The back wheel sprocket, on the other hand, should take the drive with its topmost tooth, and hence should be of slightly less pitch than the chain, but as the pitch of the latter constantly increases, it may be originally of the same pitch. The only remaining point with regard to design, and one which the owner of a car may easily ensure, is that the number of teeth in the sprockets should be prime to that of the links in the chain, or at least that the latter should not be divisible by the former, so that each tooth in turn of the sprocket shall engage every link in the chain, thus ensuring equal wear.

As the presence of mud and grit is usually inevitable, the lubrication of the chain is best effected with as heavy a lubricant as possible, and the conveyance of this to the rivets is only to be ensured by taking the chain off and immersing it in melted grease, tallow (well freed from salt) with a modicum of graphite being as good as anything. The application of chain greases to it *in situ* lubricates the rollers and teeth, but little of the lubricant so applied ever reaches the rivets, and if oil is used, though it may penetrate to them, it is soon removed from the surface by the accumulation of road dust. Shedding of chains is generally brought about either by excessive looseness or want of alignment between the sprockets and back chain wheels; a sufficient transverse rounding of the tips of the teeth is advisable to diminish the chance of it. A shrouding or flange each side of the teeth for the side plates of chain to bear on is certainly desirable, as diminishing the wear on the rollers and giving a certain increase of frictional drive; but it is not always provided. It may be here noted, as the reply to a question occasionally asked by untechnical drivers, that where there is a differential on the countershaft an inequality in the tightness of the chains does not affect their each taking their share of driving; and it is more important that the parallelism of countershaft and back axles shall be maintained than that the chains should be kept equally tight at the sacrifice of this.

R. W. BUTTEMER.

It is reported that a service of motor-cars is about to be started between Santa Fé and Grenada, in Spain.

A LIGHT motor-van, made by Messrs. Marshall and Company, is running about Manchester.

LA COURSE DU CATALOGUE, which has been postponed twice, has been definitely fixed to take place on the 29th inst. Up to date thirty-nine entries have been received.

UNDER the title of the San Juan Transportation and Trading Company, a concern has been formed by a number of American capitalists with the idea of supplying Porto Rico with an automobile service, doing a passenger, mail, and freight business.

TWO French chauffeurs—MM. Schrader and Oury—are about to undertake a tour round France in a voiturette, the engine of which will use as fuel a mixture of 50 per cent. alcohol and 50 per cent. petrol.

HERE AND THERE.

LORD LLANGATTOCK has been presented with the freedom of the borough of Monmouth, last conferred on Lord Nelson in 1782.

UP to the time of going to press about a dozen entries had been received for the Automobile Club's petroleum-spirit trials to be held to-day (Saturday).

A SYNDICATE has been formed in Bordeaux by the owners of cycles and motor cars to protect their own interests, and to insure themselves against accidents.

THE appearance of an electric motor-van in the streets of the little village of Dagenham, Essex, the other day, caused great excitement among the inhabitants.

THE Tours Committee of the Automobile Club is making preparations for the Whitsuntide Tour, which will probably take the form of a run to Paris to witness the Gordon-Bennett race.

MR. STAPLEE FIRTH was summoned the other day at the Poole police court for furiously driving a Locomobile steam car. After a lengthy hearing the case was dismissed, no costs however being allowed.

THE military authorities in Algiers have decided to test automobile wagons, and have ordered M. G. Le Normand de la Fosse to make a trial trip to Gardhaia, and if necessary to El Golia.

THE Memorial drafted by the Liverpool Centre concerning Tare Limit is being circulated by the Automobile Club for signature, and will shortly be transmitted to the Local Government Board.

M. ANDRE A. GODIN, of 10, Gray's Inn Place, W.C., the London general agent of the well-known French firm of E. Schlaverand, of Paris, has sent us a copy of a new list of valves, pumps, reservoirs, and other motor-car accessories of which the firm make a speciality.

WE have received an attractive little circular from the Mitcham Motor Company, Wandle Works, Mitcham, Surrey. Among their goods we notice a marine petrol two-cycle engine for boats, ranging from 1½ to 6 h.p. These engines, it is stated, will run in either direction, no reversing clutch being necessary.

SEVERAL members of the Automobile Club are arranging to tour down to Liverpool, starting on May 31st, on the occasion of the heavy motor trials which are being organised by the Liverpool Self-Propelled Traffic Association. A dinner in connection with the trials will be held on Monday, June 3rd.

THE charge against Mr. Bird, the well-known motorist, of Birmingham, for driving furiously was dismissed. Another summons was then issued, in which Mr. Bird was charged with driving at the rate of more than twelve miles an hour. This case was also dismissed. Mr. Staplee Firth acted for the defence.

THE Technical and Legislative and Trials Rules Committee of the Automobile Club is engaged in preparing the regulations for consumption in the Hill-climbing Trial, which is to take place on Thursday, the 2nd May, immediately preceding the opening of the Exhibition at the Royal Agricultural Hall. It is probable that the competition will be similar to the quarterly 100-mile trials.

IN the Triennial Report of the Chairman of the Oxfordshire County Council it is stated that, in view of the difficulty of keeping control (under the Light Locomotives Act, 1896) over those owners of motor-cars who, by travelling at excessive speed to the public danger, evade the possibility of identification, the Council have, in common with those of neighbouring counties, urged the registration and distinctive numbering of all such vehicles.

THE Celeritas Automobile Company of Vienna have just finished a new 12 h.p. car. It is propelled by a Buchet vertical two-cylinder engine fitted in the fore-part of the frame. The transmission is on the lines of the Panhard and Daimler systems, five speeds forward and a reverse motion being provided for.

AN English model of a heavy steam-waggon has been forwarded to the Toledo factory of the American Bicycle Company. The company intend building their wagons on the English model.

THE examples set by the Shah of Persia, the King of the Belgians and the King of England must be contagious, says the *Auto-Velo*, as the Khedive of Egypt has just purchased a motor-car from a French firm.

THE Caledonian Motor-Car and Cycle Company, Limited, of Aberdeen, have secured the sole agency in Scotland for the motor vehicles and frames manufactured by Messrs. Panhard and Levassor, of Paris.

EVEN 'bus proprietors are beginning to realise the advantages of the motor-car over the ordinary 'bus. An enterprising proprietor of Chester has decided to run an express motor-car service between Chester, Kelsall, and Tarvin.

IN connection with the Dublin Spring Show, a parade of twenty-seven motor-cars was held in the jumping enclosure at Ballsbridge on Wednesday last. A great number of people, including the Lord Lieutenant of Ireland and the Countess Cadogan, were present at the parade.

MESSRS. MORGAN AND WRIGHT, of Chicago, have sent us a pamphlet dealing with their solid rubber motor-vehicle tires. To fasten the tires in the channels flat steel bands are used, and it is claimed that by such the tires can be made secure with little or no difficulty.

THE Berlin postal authorities are satisfied with the tests of electric motor-cars, and have decided to continue to use them. A car has recently been built with motors applied to both front and back wheels. In size it is much larger than its predecessor, its capacity is also much greater and equal to that of the largest cars of its sort.

THE Union Automobile de France has decided to organise a speed competition for touring cars to be held in May. The course will be in the form of a handicap, the following points being taken into account: (1) The weight of the car in running order; (2) the power of the motor; and (3) the weight carried.

MESSRS. PANHARD AND LEVASSOR have, it is reported, acquired the French rights in the Auto-Sparker, of the Motsinger Device Manufacturing Company, of Pendleton, Ind., U.S.A. The Auto-Sparker is a self-regulated dynamo, which furnishes a continuous electric current for the explosions in petroleum-driven automobiles. Messrs. Panhard and Levassor will, it is said, fit the device to all their cars.

THE Count and Countess de Chasseloup-Laubat have been touring in the Sahara on a motor-car. The appearance of their motor-car at Tuggurth caused the liveliest interest, as it was the first time that the horseless car had been seen in that part of the Sahara. In spite of sand-banks and the bad condition of the roads, the Count and Countess covered a distance of 230 kilometres—from Biskra to Tuggurth—in eleven hours. It takes a good horse two or three days, and a caravan eight days, to cover the same distance.

THE sub-committee of the A.C.G.B.I. and a committee of the Scottish Automobile Club are proceeding with the preparations for the Big Event of 1901, which may probably take the form of a meeting of the Trial Vehicles at Carlisle on or about Tuesday, August 27th, a trial run from Carlisle to Glasgow on Wednesday, August 28th, and trial runs of 100 to 110 miles a day beginning and ending at the Glasgow Exhibition each day for nine days, beginning Thursday, August 29th, and ending Saturday, September 7th.

SOME excitement was caused on Clapham Common, on Good Friday, by a motor-car being set in motion by a boy. A gentleman left the car outside a house, when some boys gathered round the car. One of the lads, mischievously inclined, set the machine in motion. The car only travelled a short distance, when it suddenly turned on the path and dashed into a wall at the corner of Nightingale Lane. The vehicle was much damaged, but no one was injured by the runaway.

WIDTH OF PNEUMATIC TIRES ON MOTOR-CAR VEHICLES.

The following letter from the Local Government Board has been received by the Automobile Club:—"It has been represented to the President that with regard to the regulations issued by the Local Government under the Locomotives on Highways Act, 1896, the width of the pneumatic tires should be less than the width prescribed for iron tires, i.e., if the width of an iron tire is 3 in., the rubber tire might be 2 in. or at most 2½ in. in width. 'If 3 in. is maintained, it will cause great expense and inconvenience, as the Trade have always made them 2½ in.'

I shall be much obliged if you will inform me:—(1) As to the descriptions of pneumatic tires adopted by the Trade for motor-vehicles. (2) Whether any complaint has ever been received by the Club as to the width prescribed by the regulations for this description of tire (whether hollow or solid) according to the weight of the vehicles, and if, in the opinion of the Club, there is any reasonable ground for complaint by the Trade in this respect? (3) Are motor-cars over one ton in weight fitted with pneumatic or rubber tires, and is there any recognised limit of weight of carriage, to which such tires can be fitted? (4) How does the width of tire, in proportion to the weight of carriage which is prescribed by the regulations, compare with the width prescribed in France, or other Continental countries under similar conditions? (5) How is the width of the pneumatic tire measured?"

The following reply was sent from the Club by the Secretary:—

(1) The pneumatic tires used for motor-vehicles consist, for the larger part, of an outer cover of indiarubber, which is attached by various systems to the metal rims of the wheels, and an inner tube. This tube is inflated with air under pressure. I send you herewith a section of one of the most commonly used forms. With the section is also a section of the metal wheel rim.

(2) No complaints have been received by the Club as to the width prescribed by the regulations for this description of tire, namely, pneumatic.

As regards solid indiarubber tires, there is, in the opinion of the committee, ground for complaint in respect of the conditions laid down in the regulations. There is no necessity for the solid rubber tires of a motor to be as wide as the regulations require. In proof of this fact I would remark that many motor-vehicles having solid rubber tires do not comply with the regulations. In spite of this no damage has been done by vehicles to the road. Had that been the case, the authorities would have noticed it, and would have called attention to the breach in the regulations. But, so far as I am aware, no complaints on this ground have ever been made.

(3) Motor-cars weighing over one ton are fitted with pneumatic and with solid rubber tires. I do not think it is likely that vehicles weighing over one-and-a-half-tons will be fitted with pneumatic tires, since the law would not permit them to travel at more than eight miles an hour.

(4) I regret I have no regulations in respect of the width of tires prescribed in foreign countries. I am under the impression that no such regulations exist. Whether such regulations exist or not, all makers in France adopt such width as they find best suited for their cars.

(5) The width of pneumatic tires is measured by its outside diameter at its widest point when inflated.

In conclusion, I am to state that the Committee of this Club would recommend the removal of all restrictions in respect of the width of indiarubber tires, because neither makers or users of cars will employ tires which are not of sufficient width to secure considerable life, and the narrowest tires they can use economically are quite harmless in their effect on the roads. The Committee, therefore, trust that the Local Government Board will see their way to remove restrictions as to the width of indiarubber tires.

THE AUTOMOBILE CLUB'S QUARTERLY 100-MILE TRIAL.

As briefly mentioned in our last issue, the quarterly 100-mile trial of the Automobile Club was held on Tuesday, the 2nd inst. The usual route was followed, viz., from the second milestone from the Marble Arch, via Ealing, Uxbridge, Beaconsfield, High Wycombe, and Stokenchurch, to the fifty-second milestone (outskirts of Oxford), and back. Total: 100 miles. The road was rough in parts with occasional patches of unrolled metal. The surface on Dashwood Hill was loose. The weather was bright, but a strong head wind was encountered on the return journey.

The hills on which hill-climbing trials took place were:—(a) The steep portion of Dashwood Hill, commencing at 33rd milestone and ending at danger board at the top, 1,180 yds., having an average ascent of 1 in 160 and including 352 yds. of 1 in 10.9. (b) One mile, including Dashwood Hill, commencing at the 33rd milestone and terminating at the 34th milestone, having a total rise of 241 ft. in 1 mile, including 275 yds. of a gradient of 1 in 21.7 and 600 yds. of a gradient of 1 in 11. (c) Aston Hill on the return journey, distance 1 mile 1,100 yds., having a total rise of 316 ft. and including 1,910 yds. of a gradient of 1 in 21.

Only two vehicles took part in the trials as follows:—

A Gladiator 6 h.p. voiturette (the Motor Power Company, Ltd).

This car had four seats but on the trial carried only two persons. The following are the results as given by the observer:—

Quantity of petroleum spirit used on the journey:—½ gallons.

Quantity of water used on journey:—6 pints.

Average cost of fuel per mile at 1s. 3d. per gallon:—6d. per mile.

Speed including time occupied by all stoppages:—Up to the legal limit of 12 miles per hour.

Number and cause of stoppages:—(1) Owing to fracture of pipe between petroleum spirit tank and carburettor. This was mended with rubber tubing. Delay fourteen minutes.

Hill-climbing speeds:—(a) The Steep Portion of Dashwood Hill:—Took two passengers all the way up. Time, to danger board, 4 min., equal to 10 miles per hour. (b) One mile including Dashwood Hill:—Took two passengers all the way up. For the mile 6 min., equal to 10 miles per hour. (c) Aston Hill: Took four passengers up. Time 11 min., equal to 8.8 miles per hour.

A Marshall dog cart entered by Messrs. Mann and Overton, 25, Mortimer Street London, W. The results obtained were:—

Speed, up to legal limit of 12 miles per hour.

Number and causes of stoppages:—The car ran without a stop for eighty miles, when the trial was abandoned owing to fracture of crank-shaft.

Hill-climbing speeds:—(a) The steep portion of Dashwood Hill:—Took two passengers up all the way. Time, to danger board, 6 min. 25 sec., equal to 6.26 miles per hour; (b) One mile, including Dashwood Hill:—Took two passengers up all the way. For the mile, 7 min. 35 sec., equal 7.9 miles per hour; (c) Aston Hill:—Took two passengers up all the way. Time 14 min. 7 sec., equal to 6.9 miles per hour.

THE DAIMLER MOTOR COMPANY.

AN extraordinary general meeting of the Daimler Motor Company, Limited, was held on Wednesday, at the Holborn Restaurant, W.C., under the presidency of Mr. E. H. Bayley (the chairman of the company). The secretary (Mr. George T. Grant) having read the notice convening the meeting, the Chairman said: Although this meeting has been called for a specified purpose, it may reasonably be expected that I should give you some information as to the company's present position and prospects. In my remarks at the general meeting six months ago I expressed a sanguine view of the probable business for the present year. Judging from the highly satisfactory business that has been done so far, I am surprised at my own moderation. The orders have gone up, if not in leaps and bounds, at a rather surprising rate. During the past month of March we received orders amounting to £7,608, as compared with £5,400 in the corresponding month last year. The goods delivered during the past six months amount to £29,678, being an increase of about £6,000 over the amount for the corresponding period last year. The orders at present on hand amount to £33,550, which is greatly in excess of the amount at this time last year, and this does not include repairs, which are the most profitable part of the work. At the last meeting I led you to believe that you would receive a high dividend this year. Judging from the figures I have laid before you, it is clear that you ought not to be satisfied with less than 10 per cent. It is obvious that the success or failure of the business depends largely upon the officials. We have at last, however, secured a works manager who, if he has a fair trial, will, in my opinion, prove a great success. During the short time that he has been in charge he has effected a great transformation in the appearance of the place, which an experienced eye can discern at once, and the work is being turned out much more satisfactorily. I may also add that the management of the London showrooms is now, as compared with what it was when I joined the board, as light compared with darkness, and this remark applies to the company's business generally. With regard to the financial position it is desirable, in the interests of the shareholders, that debentures should not be issued sooner than is necessary, as, of course, they stand in front of the shares. With good management the company has been able to meet its engagements for two years without debentures, and had it not been interfered with the issue might probably have been postponed for some time, if not altogether. Shortly before or after the last general meeting Sir Edward Jenkinson organised a committee of shareholders, avowedly to support the board, or, to quote the exact expression made use of at the meeting, "to strengthen the board's hands." I have not heard of any investigation made by this committee, and I am in total ignorance of any complaint that has been made; but an intimation was made that this committee insisted upon a new board being elected. No self-respecting director will remain in office when informed that the shareholders do not desire his services. Messrs. Thomas Bayley and Holt resigned on February 19th, leaving only Mr. Mace and myself to carry on the business. I intimated to Sir Edward Jenkinson's committee that I intended to resign—and I hereby repeat the intention—as soon as new directors can be appointed. The proper course would have been for members of this committee to have accepted office themselves. The only member eligible and willing to join the board appears to be Sir Edward Jenkinson himself. I can truly say that he is not more eager to come on the board than I am to be relieved of my responsibility. He will have as colleague Mr. Mace—and I trust that they will conduct the affairs of the company as successfully, or more so, than the late board. The business of this meeting is to elect directors, and I will now call upon Mr. Allingham to propose Sir Edward Jenkinson's election.

Mr. Allingham said he did not think he need say anything in

favour of Sir Edward's candidature, for he was sure that shareholders who had followed the company's proceedings during his year of office would agree that they could not have had a better selection. He would therefore now propose that Sir Edward Jenkinson be elected a director of the company.

Mr. Harvey George seconded the motion.

The Solicitor (Mr. Greenip) suggested that words to the effect that Sir Edward Jenkinson be elected in place of Mr. Thomas Bayley, M.P., resigned, should be added, and this was accepted by the proposer.

Sir Edward Jenkinson said that at the last meeting the chairman said there was a proposal being made for the sale of the business of the company, but that he had no proposal to submit to the shareholders, though he desired to consult some of the largest of them, who, he understood, were willing to confer with the board on the subject. In consequence of this, he (the speaker) and some others whom he asked to join him, as individuals—not in any way, as he distinctly said at the time, as representing the company—met the directors. The proposal for the sale of the company seemed a very good one, and they intimated to the board that they were quite willing to agree to it if a sufficient guarantee could be obtained. The proposal, shortly, was this: That £60,000 in cash should be given to the shareholders and preference shares to the amount of £50,000, making eleven shares instead of ten. He and the other shareholders conferring with the board said they could not, of course, speak for the shareholders as a whole, but as individuals they were quite willing to support a sale on those terms. The only question was what was a sufficient guarantee, and that matter was threshed out. The intending purchasers offered £5,000, but he and those acting with him considered £10,000 would be a proper guarantee to be paid in cash. That was not accepted, and the matter did not go further. As to what they were to do to-day, considering the small number of shareholders present, he deprecated their passing a final resolution appointing him as a director, and suggested that the meeting should be adjourned. If this were done he would suggest that a committee be appointed, who could, in the meantime, select gentlemen to fill the other vacancies on the board, whose names might then be submitted to the shareholders, and a board thus elected would have the support of the main body of the shareholders.

Mr. Holt said he had been glad to hear what Sir Edward Jenkinson had said as to his joining the board; because last week he put it to him that it would not be fair, at a little meeting like this, called just before a holiday, and held the day after, to make such an appointment. The chairman had given them a very good and able account of the present position of the company. He might say that he had been a director from the formation of the company up till within the last few weeks, and as to its present position, he supposed no one would deny that it was at the top of the tree in the motor-car world. He did not think they would say that the directors deserved no credit at all for bringing the company to that position. When they looked at the company's record, they found that in the first year they had made a loss on the actual trading of about £3,500; in the second year they had made a loss of £1,400; in the third year—or rather, fifteen months—they made a profit of £1,045; and last year they made a profit of over £4,000. At the last meeting Sir Edward criticised the board because they spent £5,000 in plant last year, and said that but for that they could have paid a dividend; but the company would reap very great advantage from that expenditure in the present year, and he thought it would have been short-sighted policy to have stinted the company and handicapped it this summer, when they expected a large business, simply for the sake of paying a small dividend. As to the offer of Mr. Lawson; of course, there might be two opinions as to whether that offer was good enough to accept; but he did not think there could be any two opinions among business men as to the action of the committee, or the group of Sir Edward Jenkinson and his friends, in regard to the matter. The stipulation that £10,000 cash should be deposited, to be forfeited if the purchase were not completed within three months, was practically a three months option to purchase the Daimler Company at a premium, and, considering the price of the shares at the time, he thought that was an altogether unreasonable proposal. Naturally, Mr. Lawson declined to complete, and the matter fell through. Mr. Holt, in the course of further remarks, said he would be delighted to see Sir Edward Jenkinson as a director, but did not think he had the qualifications to make a good chairman. A long discussion then took place between the directors and the chairman pointed out that no committee could be appointed at the present meeting, the only business being the election of directors to fill the vacancies which had occurred.

Mr. F. L. Rawson remarked that the company was requiring money, and the point was how they were to get it. In order to obtain cheap money they should certainly have a board which would enjoy the confidence of the major portion of the shareholders. He therefore hoped some method would be adopted by which the shareholders generally would be able to make their own selection from names which would be submitted to them.

The chairman said he had distinctly intimated that it was not his intention to remain on the board. His wish was to retire some time ago; but had he done so he would have left Mr. Mace as the only director. It was quite true there had not been the greatest amount of harmony on the board; they worked together, certainly, but there was no cordiality. He advised the shareholders to elect Sir Edward Jenkinson, so that the board might then proceed to fill the vacancies. He would remain on the board only so long as he saw the company would not suffer by his retirement.

Sir Edward Jenkinson said that if he were elected it must be on the

understanding that he would have the right, with the other members of the board, to elect another director or two directors. That was the procedure which he would follow. There would be no need whatever to call a further meeting of shareholders if they elected him under those conditions.

The chairman said he thought that was the common-sense view of the matter, and he then put the motion to the meeting. In the result eleven voted in favour and three against, and the motion was therefore declared duly carried. The proceedings then terminated.

THE SPEED OF MOTOR-CARS.

THE recommendations of certain county councils to the Local Government Board with regard to the registration and speed of motor-cars has caused strong opposition among the manufacturers and sellers of motor-vehicles. Over 100 leading members of the trade have signed the following memorial, which is to be sent to every member of the county councils in England and Wales:—

We, the undersigned, manufacturers and sellers of motor-vehicles and their components, beg that members of county councils will give careful attention to the following representations:—It has come to our notice that certain county councils are recommending to the Local Government Board that:—(a) All motor-vehicles should be compelled to carry a distinguishing number, and that—(b) the limit of the speed of motor-vehicles should be reduced to ten miles per hour.

On behalf of the large staff of employes and artisans collectively engaged in our undertakings, on behalf of shareholders and others who have supplied capital to a total of £3,345,612 for the purpose of this industry, and on behalf of ourselves, who have devoted much time, labour, and energy to the establishment of our various businesses, we beg most earnestly to protest against these proposed further restrictions on the use of automobile vehicles, being fully convinced that should they be adopted they will most seriously damage, if not extinguish, this industry, which is now being revived after a period of sixty years. We wish to point out that on the Continent automobilism, instead of being hampered by vexatious and, as we unhesitatingly regard them, unnecessary restrictions, has received marked encouragement from the Governments, the press, and the public. In the first half of the century, this country was in advance of all other nations in the design and manufacture of self-propelled vehicles. In 1832 a company, called the London and Paddington Steam Carriage Company, successfully ran Hancock's carriage, "The Enterprise," between the City and Paddington. In 1833, Hancock's "Autopsy" ran for half a year daily between Finsbury Square and Pentonville. In 1834, his "Era" and "Autopsy" were run for public service between the City and Paddington, and carried many thousands of passengers. Another of his carriages ran between Stratford, Paddington, and Islington in 1836 for half a year. Gurney's steam coaches were worked by Sir Charles Dance between Gloucester and Cheltenham, and Scott Russell established a service between Glasgow and Paisley. There is evidence to show that in the Thirties, these vehicles were being run with commercial success, and the vehicles of Maccaroni, Squire, Hill, Summer, Ogles, Church, Gibbs, and others, were on the eve of success. Legislative and other restrictions were, however, introduced of so stringent a character as to effectually kill enterprise and invention in that direction until their partial removal by the Light Locomotives Act, 1896. During the last four years, self-propelled vehicles have been free to use the roads, and there is every sign that those of the public who have had the advantage of realising from experience how far motor-vehicles are likely to fill the demand for increased facilities of locomotion have become enthusiastic supporters of the movement. We are convinced that, unless the movement is hampered and practically destroyed by legislative restrictions, there will very shortly be established in this country an industry of vast proportions, giving employment at high wages to many thousands of persons, and producing vehicles which will be of untold benefit to all classes in this kingdom.

In proof of this assertion, we beg to submit, for the consideration of county councillors, the following statement of the magnitude which the industry has already assumed in France:—

Workmen.—The number of hands employed in the industry is about 100,000, and if the allied trades be taken into account, one may put down 100,000 as a moderate estimate.

Constructors.—Some 100 firms are supplying the public with automobiles, but about 300 firms are actually constructing self-propelled vehicles, and an enormous amount of experimental work is being done.

Output.—1,500 cars and voiturettes, and 4,000 motor-cycles, valued at nearly £1,000,000, are estimated to be constructed yearly in France.

Leading Firms.—

Name of Firm.	Area of Works.	Yearly Output.	Workmen.	Capital (francs).
Panhard et Levassor	8,000 metres	300 vehicles	500	5 millions.
Peugeot	8,000 "	350 "	500	
Mors	3,000 "	100 "	60	2 millions.
De Dion	14,000 "	400 "	—	—
		(3,200 motors)		
Richard	4,000 "	150 cars	—	3 millions.
Dietrich	4,400 "	150 "	—	2 millions.
Clement	14,000 "	—	500	—

The export of automobiles from France in 1900 was at the rate of £330,000 per annum. We respectfully but emphatically submit that it is impossible and unjust for any person to make a recommendation

concerning what is, or what is not, a safe speed for motor vehicles, unless he has practical experience of the control of motor vehicles, seeing that what would be undoubtedly an unsafe speed for a horse-drawn vehicle is a perfectly safe one for a motor-propelled vehicle with its exceptional power of arrest and direction. In confirmation of this statement we beg to remind county councillors that in France, where the authorities have had a large experience of automobile traffic, the maximum speeds have been now fixed at 18½ miles (30 kilometres) on country roads, and 12½ miles (20 kilometres) where there is considerable traffic. Furthermore, we have evidence that in cities and towns where electrically-propelled tramways are in use, the speeds of these tramcars frequently exceed 15 miles per hour, and they often travel up to 20 miles. We submit that if, in a city, a tramcar, which has a run on an arbitrary fixed course and has not the safeguard against accident derived from facility of direction of the motor-vehicle, can be run with safety at the speeds above mentioned, the restriction of the speed of motor-vehicles in the open country to ten miles per hour is not only unjust but unnecessary and unreasonable.

We further submit that the compulsory numbering of private vehicles, which are propelled by mechanical power, would have a most damaging effect on the motor industry. Although such a restriction might be possible on the Continent, where there is not the strong feeling against public identification or the attraction of public attention which is the characteristic of the English gentleman, the stigma implied by the numbering of a motor-carriage would not be tolerated in this country, with the consequence that the motor industry would be most seriously damaged. We submit that in spite of the assertions that motor-vehicles are driven in this country at excessive speeds, there is no evidence that motor-vehicles have been directly responsible for endangering the lives of other users of the road to such an extent as to warrant any steps which may be likely to affect in this country an industry which, owing to early legislation, has been severely handicapped in the past, and which on the Continent is being encouraged by the heads of States, by Government Departments, by Municipalities, by the Press, and by the public.

FURIOUS DRIVING CASES.

At the Linlithgow Sheriff Court, last week, T. R. Outhwaite, Kingsburgh Motor Car Works, Granton, was charged with having on 12th March driven a motor-car under his charge in a furious and reckless manner on the highway in the village of Blackburn, whereby it came in contact with William McMaster, a lorryman, residing at Harthill, and knocked him down, to the injury of the person. A plea of guilty was tendered, under an explanation to the effect that the lorryman, who had been delivering goods at a house, had not taken cognisance of the speed at which the motor was travelling. On hearing the motor coming the lorryman rushed out of the house to his horse's head, and the car, although it was not going at a great speed, came up to him sooner than he had expected, with the result that he came in contact with one of its sides. Had he paid more heed to the speed of the car the accident would not have happened. A fine of 15s., or ten days was imposed.

At the Marylebone Police Court, on Tuesday, Edgar Savonneau, a Frenchman, aged 19, and describing himself as an engineer, residing at Notting Hill, was accused of driving a motor-car along the High Road, Kilburn, at a rate of speed that endangered the limbs and lives of His Majesty's subjects. Constable 173 S deposed that he was in the High Road between three and four o'clock on the previous afternoon and saw the defendant driving a motor-car at high speed. In order to keep clear of an omnibus he made a sudden swerve, with the result that he very narrowly escaped collision with a perambulator in which two children were riding. Having steered clear of what might have been a terrible accident, he ran full-till at an ice-cream barrow, which was smashed and capsized, the motor-car itself having its front part stove in. Mr. Plowden (to witness): How far off was the defendant when your attention was first attracted to him? About 400 yards, your worship. At what rate of speed did you estimate him to be travelling? At least twenty miles an hour. How did you arrive at that? He passed everything he overtook, 'buses and all. But a person need not be travelling twenty miles an hour to pass an omnibus. But he was passing bicycles as well, your worship, quite easily. How many bicycles did he pass? Twenty, sir. Twenty within a space of 400 yards? Yes, sir. Being holiday time there was a great lot of bicycles on the road. And at what rate of speed were they going? At a good rate, sir, and the defendant was going twice as fast as any of them. Mr. Plowden then addressed the accused, who spoke English very imperfectly: Well, now, what do you say as to your rate of speed? Were you doing twenty miles an hour? No, seven or eight. That is slow for a motor-car; why were you not going faster? Because I had my old lady riding with me. Mr. Plowden (glancing at the youthful appearance of the defendant): Your old lady! Your wife, do you mean? My missus, sir. The Under Gaoler: He means the old lady to whom the motor belongs, your worship; she employs him to manage it. On the magistrate inquiring whether this lady was present, Constable 173 S explained that she had been informed that it would be necessary for her to attend, but she had flatly refused to do so. The defendant said, in defence, that it was purely an accident. He was not going half so fast as the constable alleged. The bassinette containing the two babies got suddenly in his way, and it was in trying to avoid it that he ran into the ice-cream barrow. Mr. Plowden remarked that the whole matter turned on the rate of speed at which the motor was going

when seen by the officer, and as the evidence on this point was not indisputable the accused would be dismissed with a caution.

At the Abercynon Police Court on Wednesday, Mr. W. Parker Thomas, the manager of the Aberdare Valley Motor-Car Company, who was defended by Mr. W. D. Phillips, the secretary to the Company, was summoned for furiously driving his motor-car in Abercynon to the danger of pedestrians. Police-Sergeant Thomas Davies, who laid the information, said that on the evening in question he was standing on the Taff line near the station, when he saw a motor-car on the main road from the direction of Pontypridd. It was travelling at a very fast rate. It then turned down the hill in the direction of Aberdare, and came down the hill, which had a gradient of 1 in 20 at the rate of thirty miles an hour. Witness, as soon as the motor passed, went to the station and telephoned to Mountain Ash, but by the time the Inspector got down to the main road he found that the car had passed, and he telephoned to Aberaman, where it was stopped. The car had travelled from Abercynon to Aberaman, a distance of 6½ miles in twenty minutes. The magistrates' clerk: "That would be nineteen miles an hour." The witness was cross-examined at some length as to the speed, and had to admit that he had not timed the car, he only judged the speed by seeing it travel, it was practically a guess. He said that he walked from the spot where he stood to the police station whence he telephoned in three minutes. His evidence was corroborated by Mr. Joseph Hiscock, the stationmaster at Abercynon, who said that his attention was drawn to the car by the passengers at the station who chaffed him that the car beat the Taff Vale trains hollow in the matter of speed, but he went one better than the sergeant and swore that the car was travelling at the rate of thirty miles an hour on the flat and forty miles an hour down the hill. The Bench having overruled a technical objection to the summons told Mr. Phillips that there was a case for him to answer and he put the defendant into the box. The latter swore that the motor was geared up to twelve miles an hour and could not travel beyond that speed on level ground, and that coming down the hill he had it in gear with the brake on; it was only running at the rate of eight miles an hour. Any one looking on always wrongly judged the speed of a motor, partly because they saw no motion, and because the car was low and the wheels small and many spoke. The summons was dismissed.

MOTOR-CYCLE RACING AT BRIGHTON.

THE five miles motor-bicycle and tricycle handicap at Preston Park, Brighton, attracted a large number of people on Easter Monday. Six competitors entered for the race. First heat.—1, Raymond Dennis, tricycle, 1,000 yds.; 2, E. Baruch Baker, tricycle, scratch. Also competed: G. Shippam, 500 yds.; Alfred Deveroux, tricycle, 750 yds. Won by over a lap. Time, 10 min. 10 sec. Second heat.—1, T. H. Tessier, bicycle, 1,700 yds. Also competed: J. H. Best, tricycle, 1,150 yds. Best's machine went wrong in the sixth lap, and he gave up. Time, 10 min. 33 1-5th secs. Final: Raymond Dennis, 1,000 yds., 1; T. H. Tessier, 1,700 yds., 2; E. Baruch Baker, scratch, 3. The scratch man was very slow in getting speed up, and meanwhile Dennis gained steadily on Tessier, and passed him a lap and a half from home. To the end Dennis careered round the track in great form, and won a fine race by nearly half a lap. Baker made up a lot of ground in the last lap, but his efforts came too late. Time, 9 min. 28 3-5th sec. The prizes were as follow: First prize, plated rose bowl and stand; second, fruit bowl and servers; third, plated nut stand. The tricycle run by Raymond Dennis was a Speed King of 2½ h.p. fitted with free clutch, water-cooled head, and spray carburettor, while the bicycle used by Tessier was of the Werner type.

A BILL has been introduced in the New York Legislature which exempts carriages and motor-vehicles propelled by steam, developing less than twenty-five h.p., from the law requiring the owner of a steam vehicle to send a person an eighth of a mile ahead on the public highways to warn others of the approach of such a vehicle.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, APRIL 20, 1901.

[No. 111.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE publication of the memorial drawn up and signed by motor-vehicle manufacturers for presentation to the Local Government Board has met with a most favourable reception at the hands of the daily press of the country. Indeed, automobilists and the motor trade generally may congratulate themselves that those who control our newspapers are beginning

to take a more reasonable view of the automobile movement; almost every paper in the land has this week had something to say on the subject, and with but very few exceptions have taken up the views put forward by the motor traders. The only outburst of "anti-motor-car" feeling is that in which the London correspondent of a Sheffield daily indulges. This writer is not only amusing, but at the same time displays his utter ignorance with the question with which he attempts to deal. Whilst admiring a journalist who tries to make the best of the gift of imagination, with which this gentleman is evidently endowed in a marked degree, his comments would, however, be worthy of respect if they only savoured of fact. The following extract on motor-cars may well serve as an instance of his rabid sensationalism:—"They are as ugly as sin—a traction engine is a vision of elegance compared with them; their stench is vile, their uproar is diabolical, and their drivers in attire and manner resemble Arctic explorers in a state of dangerous lunacy." Would some philanthropic motorist, pitying this gentleman's ignorance, offer him a ride on his motor-car? In spite of his anti-motor expressions there is still hope for his conversion.

The Daily Telegraph's Views.

As against the vapourings of the London correspondent of the Sheffield paper, the leader-writer of the *Daily Telegraph* deals with the same subject in a manner which cannot but win the respect of any reasonable individual. Referring to the proposal of the county councils to ticket each motor-car he says: "It would be the height of unwisdom to impose it upon the owners of automobiles. It would be as reasonable that it should be rendered binding upon the members of the Four-in-Hand or of the Coaching Club." On the subject of speed restrictions he winds up some cogent arguments in the following terms: "The great and conclusive objection to the measure is that its tendency would be to subject skill and knowledge to the control of ignorance and stupidity, and thus to impede invention and to delay the progress of improvement." In conclusion he says: "The restrictions against which the memorialists protest are as absurd in theory as they would be vexatious and ineffective in practice."

The Times Endorsement.

THE *Times* has done a splendid service to the development of automobilism by its admirable leading article of last Friday week. Nothing could have been more emphatic than its endorsement of the manifesto of automobile manufacturers, and its repudiation of the absurd suggestions raised in some

quarters as to numbering and the imposition of further speed limitations. Very gratifying, also, was it to see in Monday's *Times* a cogent letter from Sir Frederick Bramwell, one of the few men living who can remember the opposition to mechanical road traction in the thirties. It will come as a distinct surprise to many, moreover, to find that a Parliamentary Committee of 1832 actually reported favourably upon steam coaches, and that it was the hostility of other authorities that succeeded in strangling the new movement. On the following day a further letter on the subject of motor-cars was published in the same journal, from the pen of Captain the Hon. Cecil Duncombe, who testified to the entire unconcern with which the horses of the Riviera now regard the flying automobile, despite the races that take place there on the open road, and the high rate of speed that is at all times permitted. The Automobile Club could hardly do better than reprint both leading article and letters, and distribute them as widely as its funds will permit.

The Brighton Road.

LONDON motorists, out for a spin to Brighton, will find themselves brought to an untimely stop outside the Swan and Sugarloaf, Croydon, and requested to proceed by the side roads. From that point up to Purley Corner the road is "up" whilst the navvies are laying the electric tramways. As soon as the work is finished in that quarter, the road from Thornton Heath to Norbury will be torn up. In order to avoid delay and inconvenience motorists proceeding from London had better take the Clapham road, and, turning at Tooting, travel via Mitcham and Wallington, joining the Brighton road at the Old Mans, Coulsdon.

The Shah and his Motor-Car.

THE roads of Persia are not all that can be desired even by such a zealous motorist as the Shah, and he has, therefore, ordered all of them in the vicinity of his capital to be at once repaired and made suitable for motoring. In his ardour the Shah drives his motor-car along mountain paths where, according to his *mécanicien*, "I have passed in trembling, the roads being hardly safe for a camel." In other spots the ground is as soft as butter, especially in the rainy season. But in spite of these little difficulties and even of his trembling *mécanicien* the Shah only uses his horse-drawn Daumont when on visits of etiquette in the city of Teheran.

Our Antiquated Legislation.

THE regulations of narrow-minded Borough Councils with regard to motor service are already making themselves felt. What was regarded as a beneficial project for the farmer has now had to be abandoned. This was a scheme for the carrying of market-garden produce to the metropolitan markets by means of a motor-car service. Commenting on this, the Secretary of the Farmers' Collecting and Carrying Association says:—"Despite the fact of a keen desire on the part of farmers and fruit-growers for such a scheme, and the promise of an enormous quantity of freight, our antiquated legislation makes it impossible for the scheme to even pay its way. A fast motor is only allowed one trailer, while a traction engine, with

its three trailers, is limited to a speed of four miles an hour. It resolves itself into a question of speed. A motor and trailer, under the present regulations, carrying 6 tons must take two days for a round trip. The working expenses of four vans and four motors would amount to £3,000 annually. They could only earn £2,200 a year, by taking freight on the up journey at an average of 9s. per ton, and on the down journey at 3s. per ton." We hear, however, that a large strawberry grower in the Maidstone district has been looking into the question of conveying his fruit to the London market by road, and it is probable that some experiments in this direction will be made during the coming summer. From what we hear, it is intended to use light vehicles capable of carrying loads of about 6 cwt., so that it will be possible to make two journeys to town and back each day.

MR. J. H. KNIGHT'S SUGGESTION FOR THE EXHIBITION POSTER.

How Dare You, Sir?

SUCH was the expression used by Mr. Staplee Firth, the well-known solicitor, to a magistrate at Poole, in a case in which our friend figured as defendant. The charge was one of furious driving, the speed reported to be between fifteen and twenty miles an hour. Mr. Firth was cross-examining the constable, who certainly had a bad quarter of an hour, and is not likely, we imagine, to trouble what speed motorists go in the future, for fear he should catch another tartar. "How absurd," Mr. Firth heard one magistrate say to another, in regard to a perfectly legitimate question asked, and then the solicitor-defendant let loose the vials of his wrath and threatened to leave the court, seriously warning the Justices Shallow that if he did he should apply to the High Court for a "writ of certiorari" and quash their proceedings, should the verdict be given against him. The magistrates were of the usual country type, only a little bit more so, his Worship the Mayor being in the chair. The point of law raised was so clear that there was no alternative except for the case to be dismissed, the magistrates grudgingly doing so, refusing the defendant his costs.

The Art of Diagnosis.

A HINT that may sometimes prove useful is afforded by the following. An automobilist on a recent journey found his car going badly, with evident loss of compression somewhere, though a hasty inspection failed to locate it. Being near his destination, the house of a medical friend, who had recently become a convert to automobilism, he postponed

further examination, and on reaching his friend's house the latter offered to perform the operation—known in America as "bug-hunting"—for him. Within a very short time he came in with the information that he had spotted it without moving a nut, and "it" was a leak round the igniter porcelain. "How did you manage to do it?" asked motorist No. 1 in classic language. For answer the doctor produced a binaural stethoscope, and demonstrated how by its aid one could detect the locality of any unusual noise about the machinery, and the automobilist expressed his conviction that no tool-box should be without it. Truly, "there is nothing like leather!"

Motor-Cars at Aberdare.

WHEN the motors were first introduced into Aberdare, the brake owners and brake drivers attempted to prevail on the District Council to refuse to grant them licences to ply for hire, and with the assistance of a number of ardent socialists, who ostensibly urged the council to municipalise the motor-cars, they called a number of meetings at which resolutions were passed urging the Council to decline to license the cars. There efforts were, however, unavailing, and the cars have become extremely popular. It is clear, however, that the advocates of the policy of refusing them licences are still anxious to hamper the motor-cars, for at the last meeting of the Council, Councillor T. Lewis, who is a most determined opponent, endeavoured to get the Council to prohibit the motor-cars being run through the public park although the brakes are allowed to run through; the council, however, declined to pass such a resolution.

The Mors Race Timing Method.

AN interesting feature of the recent races at Nice was the timing method adopted, the vehicles being timed electrically by a system invented by M. Louis Mors, brother of the automobile maker of that name. Three watches were used, connected by wire—at the start, at the beginning of the kilometre and at the end of a mile. When each car started the two watches at the kilometre and mile marks were set going by electrical current and were stopped as the vehicle passed over the wires across the road. In this way the times of the flying kilometre and the standing mile were obtained without the slightest chance of mistake.

Leaving Motor-Cars Unattended.

OUR readers are aware that for some time past the City justices have interpreted the words, "There shall be in charge of a light locomotive when used on any highway, a person competent to control and direct its use and movement," to mean that the motor-car should not be left in the roadway by its occupant, unless he leaves a competent driver in charge of it. Mr. W. C. Bersey was summoned for leaving his motor-car opposite Winchester House in Old Broad Street, the only precaution which he took being to ask an old man who was selling newspapers to keep his eye on it; but before leaving it he had stopped the engine, and taken out the electrical interrupter and put it in his pocket. Mr. Staplee Firth defended Mr. Bersey, and argued that the motor-car at the time was not being used on the highway within the meaning of Article 2, Sub-Article 8, of the Local Government Board Regulations set out above, and he pointed out to the Court that as the engine was stopped the car was inanimate and could not move, and that it was very different to leaving a horse or horses standing unattended, because the horse could move of his own volition. Notwithstanding this, very often a small boy was left in charge of two horses, and this was sufficient to comply with the requirements of the law. It was, therefore, obviously unnecessary to leave anybody in charge of a motor-car. Mr. Firth also pointed out in favour of this argument, that Article 4, Sub-Article 4, of the regulations, said, *inter alia*, "He shall not quit the light locomotive without having taken due precautions against its being started in his absence, or allow the light locomotive, or a vehicle drawn thereby, to stand on such highway so as to be a cause of any unnecessary obstruction."

tion thereof." Mr. Alderman Green, who heard this case, stated to Mr. Firth in court that he had taken very great interest in the argument, and while sympathising with the same, the Justices had held a contrary view and always convicted; and that he did not feel disposed to take the responsibility of introducing a fresh decision. Mr. Firth applied for a special case, with a view to taking the decision of the Court of Appeal upon it.

Another Case and the Result.

SUBSEQUENTLY another summons was issued against a gentleman for leaving motor-car unattended, but he had removed the interrupter, and on his consulting Mr. Firth on the matter he advised him to ask the Justices to let the matter stand over until the opinion of the Court of Appeal had been obtained, or to treat the case on the lines indicated above. Since then the City Justices have reconsidered the matter, and Mr. Firth has been in communication with them. They have now decided to accept his interpretation of the law, and to instruct the police that the Local Government Board regulations do not require a competent person to be in charge of a light locomotive while at rest, provided that sufficient precautions have been taken against its being started in the absence of the driver.

Perishables by Motor Service.

A CORRESPONDENT appeals against "the regulations that seem to be framed with the sole and only intention of putting off the day when our roads must be widened throughout the country." He is of opinion that one solution of the unhealthy condition of British agriculture lies in the broadening of the country roads, enabling a quick motor-car service to be established between the metropolis and country towns and villages within reasonable distance. By this means, he points out that a farmer at Farnham could milk his cows at 5 a.m. and deliver direct to his customers in Grosvenor Square at 8 a.m., thus not only saving expense on his own side but conferring sanitary advantages on the consumer. All perishable foods could be sent a distance of thirty miles in two hours for half-a-crown. Our correspondent also supports the proposal of motor-car services as a solution to the overcrowding problems of great cities.

Electric Accumulator Progress.

It is frequently suggested that very little progress has been made in present years with regard to electric accumulators in this country. This is quite refuted by some comparative figures lately sent us by Mr. H. F. Joel. In 1890 electric storage batteries gave four watt-hours per 1 lb. of complete cell; in 1900 this had increased to eight watt-hours per 1 lb. of complete cell; while now the National motor carriage battery (Rosenthal) gives fifteen watt-hours per 1 lb. of complete cell, and has proved to be of greater durability. Mr. Joel informs us that whereas in 1890 the weight of a storage battery to propel a road vehicle twenty miles was 1 ton 4 cwt.; in 1901 the weight is reduced to 6½ cwt., and will propel a carriage over fifty miles.

The Herefordshire County Council.

THERE was a long discussion on the subject of motor-cars at the last meeting of the Herefordshire County Council, the matter arising on a report of the Roads and Bridges Committee recommending the numbering and registration of automobiles. Mr. F. Ballard made a rousing speech against the proposal, this gentleman considering that a motor-car driven at twenty miles an hour was very much safer than a dogcart driven at ten miles. Eventually, however, the following resolution was adopted:—That this County Council do co-operate with the Berks County Council in drawing the attention of the Home Secretary to the way in which motor-cars now traverse the roads, and in suggesting that every car should carry a number in a conspicuous place, and should be registered.

Mr. Mark Mayhew's Visit to Nice.

MR. MARK MAYHEW is back in town, from which he sped to the Riviera soon after his splendid victory in the Wandsworth election. He speaks enthusiastically of his experiences, which appear to have been most enjoyable.

The Automobile Club of Nice entertained him very hospitably, and elected him an honorary member of the committee, which was no empty privilege, as it enabled him to pass all barriers and go wherever he liked on the course during the races, a broad blue band, worn only by members of the committee, being the open sesame. Concerning his non-participation in the tourists' race, Mr. Mayhew ascribes it to two causes. In the first place, the system of handicapping was such that the heavier the vehicle was *per se*, the more it was required to carry in the way of passengers, and Mr. Mayhew would have had to take no less than six aboard his Napier. The second reason was the fact that all the foreign cars were fitted with brakes of a power as yet unknown in England, enabling the fourth speed to be used down hills of a type that an Englishman is accustomed to treat with extreme respect.

THE NICE WEEK. M. WERNER'S 35-H.P. MERCEDES CAR AND M. SCHNEIDER'S 40-H.P. ROCHET-SCHNEIDER CAR.
(Cliche de) (La France Automobile.)

The New Season's Racers.

WEIGHT-CUTTING, Mr. Mayhew reported, has been reduced to a fine art in the latest patterns of Panhard and Mors cars, and even the Gordon-Bennett Cup vehicles will be marvellously light—probably under one ton each. The French cars will be of 50 h.p., and excellent as was the display of the Mercedes cars in the Nice week, he does not think that they will compare with the newest patterns of the Mors or Panhard. The last named are fitted with the new Centaure motor—which is a beautiful piece of work—and the gearing has been very much improved. When worn the wheels can be removed without trouble, and new ones fitted at a cost of only 20 francs each, while the saving on the tires owing to the lightness of the cars is considerable. Mr. Mayhew, by the way, has brought over one of the latest 24 h.p. Panhards, and drove it from Southampton last Saturday in company with the Hon. C. S. Rolls. They were nearing Esher at the time the cars competing in Saturday's consumption trial were on their outward journey. The Cup race Mr. Mayhew considers a fairly open event. The chances of the Mors and Panhard cars he holds to be about equal, and as regards the Napiers their opportunity lies in their remarkable engine cycle power, though the tires will need to be nursed at every limited

owing to the greater strain to which they are subjected by the weight of the cars.

Future Developments.

So far as pure speed is concerned we seem to have but touched the fringe of future developments. Mr. Mayhew states that there is much talk in France of a possible combination of petrol and electricity. He himself, however, foresees great possibilities in the shape of petrol-cum-steam, the heat from the exhaust of a petrol motor being used to maintain the pressure in the boiler, and the steam being utilised in the main for rushing up steep hills without change of gear. The idea is a fascinating one. Who knows but that it may yet be carried into effect?

The Liverpool Heavy Motor Vehicle Trials.

MATTERS are progressing apace in respect of the forthcoming trials of heavy motor vehicles at Liverpool. Local Committees are now in course of formation at nine towns on the itineraries embraced by the trials, these committees including many influential merchants and manufacturers. The official programme, which will shortly be issued, will contain a description of each competing vehicle and complete profiles and plans of the 150 miles of roads to be traversed. We may remind intending competitors that the entries close on the 30th inst. On Monday, May 6th, Mr. Shrapnell Smith, the hon. sec. of the Liverpool Self-Propelled Traffic Association, will address the members of the Liverpool Chamber of Commerce in the Public Sale Room, Exchange, Liverpool, on the subject of "Motor Vehicles for Heavy Traffic: the arrangements for the forthcoming Lancashire Trials." This meeting is expected to be of considerable importance in its bearing upon future developments.

Motor-Cars for Military Purposes.

THE question of the use of motor-cars for military purposes is one which has been dealt with on frequent occasions in these columns, and it is very gratifying to find that Earl Roberts in his recent despatches on the South African War has given his support to our views on the matter. According to the Commander-in-Chief, traction engines and trucks rendered valuable services at such centres as Capetown, Kimberley, Bloemfontein, and Johannesburg, where coal and water were readily obtainable, but owing to the absence of fuel they could not be used on the line of march. From a military point of view Lord Roberts considers that the defect of steam traction lies not only in the impossibility of working it unless coal and water are available at each halting-place, but in the weight of fuel and water which the engine has to drag along, thus expending much of its tractive force. This defect would, Lord Roberts says, be greatly lessened if an efficient oil motor could be substituted for the steam motor, as in that case the coal would be replaced by a more portable and concentrated description of fuel.

The Wastage of Horses.

LORD ROBERTS also gives a piteous tale of the loss of horses. Not only has the wastage of horseflesh by cavalry and artillery been beyond all expectation, but from the beginning of the war up to October 31st, 1900, the Department has been called upon to handle a vast number (60,711) of mules for transport purposes, and 57,330 cobs for mounted infantry. The number of cavalry and artillery horses that have passed through the Remount Department during the same period amounts to:—Cavalry, 21,252; and artillery, 9,385.

The Forthcoming Exhibition.

A CORRESPONDENT, who signs himself "Enthusiast," writes:—"As we are now approaching the Automobile Club Show at the Agricultural Hall, Islington, would it not be as well that manufacturers should arrange to have their exhibits ready to time?" This is a wish we heartily echo, and for our own part

may say that every facility will be given to that end. Speaking of the Exhibition, we may mention that a general meeting of members of the Automobile Club and other members of the Motor Union will be held at the Royal Agricultural Hall on Wednesday, May 8th, to elect representatives on the Executive Committee of the Motor Union. It is also probable that during the week of the Exhibition, possibly on Wednesday, a Club dinner will be held at the Agricultural Hall, at which foreign visitors will be the guests of the Club.

The Automobile Club and its Work.

MR. S. F. EDGE has sent us a copy of a letter he has sent to the Secretary of the Automobile Club, in which he states that as a private user of an automobile, and also as one interested in the trade, he has felt for some considerable time that the Automobile Club has been spending large sums of money in fighting legislative restrictions, which, if they had been carried through, would have had the effect of almost entirely crippling the automobile industry in this country. Mr. Edge considers that the manufacturers and agents in this country do not sufficiently appreciate the work that the Automobile Club has done, and that the manufacturers should at any rate support the fund of the Club and not leave it to the hundreds of private members which the club at the present time possesses. With a view of setting an example, Mr. Edge, on behalf of the Motor Power Company, enclosed a cheque for fifty guineas, and stated that Mr. Paris Singer, of the City and Suburban Carriage Company, had promised to do the same. Mr. Edge has certainly done well in bringing the matter before the trade, for it is impossible to estimate the good work which is being done by the Automobile Club in the interests of the movement. Their recent action in opposing the County Councils is but one item, and yet this campaign, which undoubtedly has had the effect of preventing restrictive measures being imposed, has cost the Club no less than £500, all of which has to be taken out of the members' subscriptions. Not only have the demonstrations had good results from a political point of view, but they have had the effect of bringing the possibilities of the automobile vehicle practically before a large number of influential men who have seats on County Councils, and should therefore tend to spread the use of motor-cars. Needless to say, the efforts of the Club benefit every user of a motor-car, and its work is of the most vital importance to the trade throughout the country.

The Chicago Motor-Car Service.

THE Illinois Electric Vehicle Company, which has for many months operated one hundred electric motor-cabs in Chicago, has been compelled to go out of business because the bad condition of the Chicago streets has made unbearably heavy the burden of expense for repairs to the vehicles in use. In connection with the foregoing the following from the *Electrical World* sheds considerable light upon the problem which such companies have attempted to solve:—"Public carriage service in America is notoriously at once the worst and the most expensive in the civilised world, chiefly because tramway service is so cheap and so good, and so ubiquitous. American practice in this respect has forced the public to look upon cab service not as an everyday necessity, but as a luxury of dubious utility. This is the secret of the enormous popularity of trams. They may be crowded and stuffy, but they can at least be boarded rather easily anywhere, run at good speed, and demand only the payment of a fixed and moderate fare. From the general ill odour into which public carriage service has come, a new line of carriages, even automobiles, has a hard task in winning popularity."

IN connection with a hippomobile meeting which the Hamburg Polo Club is organising for the 29th and 30th May next, a race for motor-voitures is being organised. It will be run off on the Rotherbaum track in Hamburg, and among those eligible to compete are the members of the English Jockey Club.

THE ALBION MOTOR-CAR.

THE accompanying illustration shows one of the latest additions to the list of British-built cars, and which is already meeting with a great deal of favour on the north side of the Tweed. It is the product of the Albion Motor-Car Co., 169, Finnieston Street, Glasgow, and is manufactured by them under their own patents. The motor is petrol driven, and is of the two-cylinder horizontal balanced type. It is substantially built throughout, all the bearings surfaces being very ample, and it develops 7 h.p. on the brake when running at the maximum speed of 700 revolutions per minute. It is fitted with an adjustable governor and, when desired, with an accelerator to increase the engine speed. The power of the engine is controlled by a variable expansion gear, the controlling lever being at the driver's right hand. By means of this lever the engine can be worked from zero up to full power, and the speed of the car regulated from a crawl up to top speed. The car has two forward speeds and a reverse motion, the changes being obtained by a special arrangement of clutches and gear wheels always in mesh. The changing is claimed to be a simple and silent operation, and it is quite unnecessary to release the engine clutch when changing from the higher to lower speed, thus preventing any possibility of the car running backwards on a hill while the change is being made. The gearing is enclosed and runs in oil. The power is transmitted to the rear axle by one central driving chain. There are two powerful independent brakes fitted, both acting at the rear axle, equally efficient forward or backwards. The ignition is electrical, the current being obtained from a magneto-generator of simple and reliable design. Strength, simplicity, and reliability are the main features of the car.

The wheels are of the artillery pattern, with hardwood spokes, and are fitted with solid rubber tires. The oil tank holds four gallons of oil, which is sufficient to run the car one hundred miles when fully loaded. We have not yet had an opportunity of testing the running powers of the new car, but we understand that a number have already been delivered, and are giving every satisfaction in the users' hands.

MESSRS. BROWN BROS., of Great Eastern Street, E.C., have just introduced a new motor-bicycle, the motor of which is located over the bottom tube of the frame instead of under, as in the Minerva. The driving is done by a twisted leather belt running over an inner driving rim fixed on the rear wheel by screw clips. All levers are convenient for handling, and a switch in the handle gives entire control over the motor. The motor is claimed to be powerful enough to drive the machine at any rate up to thirty miles per hour, and will run for eighty miles without recharging with petrol.

STEERING MECHANISM.

AMONG the minor details of car construction in which the variety characteristic of industries in an early stage of evolution is manifest, one of the most important is that of steering design. It may seem absurd to class such an important point among minor details, and if the whole subject were to be discussed—which might profitably occupy many pages—it would indeed be so; but the portion of it which claims attention here, and which has met with little technical consideration, is that dealing with the final link between the front wheels and the driver's hand, where the questions involved are almost as much of a physiological as of a mechanical nature.

Much of the comfort of a car depends on its having a good steering, not merely mechanically unimpeachable, but arranged with due consideration for the driver's ease, and for the fact that he may have to operate it continuously for hours at a time; it should require little effort to operate, and at the same time need no awkwardly long reach for sharp turns, conditions not always easy to reconcile, and of which the first is the most important, except in the case of dense traffic, which the motorists evade as far as possible.

The tiller of a boat would naturally suggest itself as the first model to the designer, though it is noteworthy that Cugnot's famous vehicle shows a pair of upright handles not unlike the Peugeot bar, while James and Anderson's steam coach had a species of "squirrel-cage" wheel that must have been by no means uncomfortable in practice. Gurney reverted to the "tiller," obviating its ineffectiveness to some extent by making it actuate the front wheels of a "bogie" fore carriage; but then, as till lately, the fact was overlooked that the helmsman of a boat sits alongside the tiller, not facing its direction, and can

pull or push it with ease; while the attempt to move a bath-chair handle from side to side involves wrist and elbow muscles that are comparatively feeble and untrained.

It is clear, therefore, that the steering handle, be it bar or wheel, should be actuated by a pulling or pushing, and not a transverse motion; thus the cross-bar pivoted at the side of the driver and lying across his knees, as in some American cars, is admissible, its objection being generally a somewhat cramping proximity to the seat; also the lever used on the Pennington, of pious memory, and on the Century tandem, while the bar pivoted at the driver's elbow and lying under his forearm is faulty, as calling on weaker muscles, though having a compensating advantage in affording a rest for the arm. A variation standing somewhat by itself is the Benz "dial-plate" which owes its merits to offering a fixed support and fulcrum to the hand, and depending mostly on the strong palmar muscles for its movement, rendering it non-fatiguing even for long periods. When the supporting dial is done away with, however, the arrangement becomes unsatisfactory and tiring in the extreme. The bicycle handle-bar embodies the right principle, but owing to its limited

THE ALBION MOTOR-CAR.

range of motion involves rather too high a gear in the steering, a movement of 45 degs. or less locking the wheels; but there can be little doubt that the ability to use either hand or both should be an essential characteristic of a good design.

There is little wonder, then, that the wheel type should have become almost universal, as satisfying the need for the "pull and push" action, for the bimanual steering, and for the possibility of gearing down, i.e., having a moderately "slow" steering without great inconvenience, and it is more important, especially as speeds increase, to have a powerful steering at small angles of deflection than convenience in making sharp turns. If a gear were arranged so that a given deflection of the wheel produced, say, 5 degs. of motion in the front wheels when near the centre, and double that amount when the helm was hard over, it would, probably, have advantages.

But another point of almost equal importance has not been so well met. There is no need, as in the bicycle, to consider anti-vibration devices; these have their proper place in the tires, in the connection between the car and the axle, etc., and no special provision therefore is necessary in the steering; but the situation of the latter with reference to the driver is important, a circumstance which should involve adjustment to his height, length of arm, and so on. It may seem a counsel of perfection to suggest such a provision, and difficult to reconcile with the absolute need for simplicity and solidity, but anyone who has driven a variety of cars differing in this point will appreciate the importance of it, and one reason for the popularity of the wheel lies in the fact that it admits of much variation in the position of the hands, so that any defect due to position is not so evident. Following this is the conclusion that a large wheel is preferable to a small one, not entirely on account of leverage, which may be otherwise obtained, but for the foregoing reason, added to which is the fact that a ring of large section is less cramping to the grasp than a small one. Several patterns of small cars are uncomfortable in steering, not so much on account of the small diameter of the wheel, but of the small section of its rim.

It is recorded of a former President of Queen's College, that, wishing a comfortable study chair, he covered a board with putty, sat upon it, and gave the impression to his upholsterer to be exactly copied: and without recommending such an unconventional method to the designer of seating accommodation, the principle, embodied perhaps in something on the principle of the "try-gun" with adjustable stock, might be usefully employed to determine the best position of steering.

MR. H. EDMUNDS asks us to state that the brakes he referred to in his recent address at the Automobile Club are made by Messrs. Taylor & Co., of 255, Earlsfield Road, Wandsworth, S.W.

WITH the opening of an additional factory, the Clarkson and Capel Steam Car Syndicate, Ltd., are issuing new illustrated circulars. Among their specialties are parallel radiators, made in three sizes, specially designed for working without a pump, chiefly on voituresses and small cars. Liquid fuel burners are also a speciality of the firm. It is claimed that these burners, which are of the true Bunsen type, can use any cheap common paraffin without smoke or smell. They are safe, durable, and simple, have few parts, and give entire satisfaction. Another speciality are the radiator coils, which can be supplied of any power and of special design when required.

THE Technical Committee of the Automobile Club of America has accepted a recommendation of the National Association of Automobile Manufacturers that a weight classification be adopted in the New York-Buffalo endurance test, and has decided to divide the competing vehicles into four classes, viz.: Three for four-wheel vehicles, divided as follows: Under 1,000 pounds, under 2,000 pounds, 2,000 pounds and over, and a fourth for quadricycles, tricycles and bicycles. The basis for judging the relative merit of the machines will be an average speed between controls. The limit of speed has been fixed at fifteen miles an hour and an average speed of twelve to fifteen miles an hour between controls will entitle a machine to a first-class certificate. There will be two runs of about forty miles each day, one in the forenoon and the other in the afternoon.

JOTTINGS BY A WORLDLING.

WE are getting nearer and nearer to the Gordon-Bennett Cup, and consequently all sorts of rumours are in the air, the most astonishing being that the Panhard cars are to have four cylinders behind as well as those in front, the extra set to be used for hill climbing only. The German Club having arbitrarily issued an edict that at least two Mercedes cars should represent it, Canello and Benz were left to decide between themselves which should fill third place. The Mannheim firm, however, took umbrage at the Club's decision and retired. Will M. Canelloopoulos do the same? It will be a pity if he does, as we expect so much from him after his wager. *Cent vingt à l'heure!* It will not be quite that, but the pace will undoubtedly be tremendous. There is every reason to suppose that it will be the most exciting international contest that has ever been held in any branch of sport, not excepting Gladiateur's Derby and the great match when Aubrey Patton first won the Grand Prix at Monte Carlo for England.

I SHALL be as much interested in the performances of the tires as of the cars. France will have Michelins, Germany Continentals, and England, I suppose, Dunlops. It is to be hoped that the Coventry company will make a mighty effort, as Messrs. Napier are undoubtedly doing. One puncture this year may be fatal.

RULE 9 of the competition runs as follows:—"The cars must be constructed by members of the competing clubs, and the two seats occupied during the whole time of the race." The second part is, of course, nonsense, as you cannot do repairs remaining placidly in your seat; but is the first part adhered to? It appears to be a very democratising regulation.

I HAVE always thought that a small boat fitted with a 2½ h.p. De Dion or similar motor would have a great success on the Thames. It should be cheap—say £50 more than the boat itself. This would allow a good profit to the manufacturers, and be *dans les prix* of a large percentage of riverside-folk, to whom a steam or electric launch is out of the question. The only objection is the smell of the petrol. I should not care to be the first to introduce it into Boulter's.

MR. H. G. WELLS, the novelist, is writing a series of articles under the title "Anticipations" for the *Fortnightly*. The first, on "Locomotion in the Twentieth Century," appears in this number, and should be read by every one who takes an interest in the subject. It is full of common-sense, well set down, and his clear, positive style is most convincing, but he makes one horrible suggestion—in a half-hearted way, it is true—that the roads for motor-cars "will be made of very good asphalt, sloped to drain."

I HEAR Sir William Ingram, of the *Illustrated London News*, has just bought a car, an earnest, let us hope, of more Press assistance for our cause. *A propos*, Mr. Frank Harris, the author of "Mr. and Mrs. Daventry," and some time proprietor of the *Saturday Review*, is about to start a new sixpenny weekly. I saw him the other day, and he told me he was going to show his gratitude to the motor-car by "puffing" it as much as possible. We have been for many wonderful drives together in the South, but in England he seems to prefer his American trotters, for though I know he has an Orient Express I never see him on it.

MR. CHARLES D. PHILLIPS, writing in the *Western Mail* on the "Speed of Motor-cars," proposes that a similar demonstration to that to be given to the Gloucestershire County Council, at Gloucester, on Saturday, the 27th inst., should be given to the County Councils of Monmouth and Glamorgan.

THE PETROLEUM-SPIRIT DISTANCE CONTEST.

THE petroleum-spirit distance contest, organised by the Automobile Club, was held last Saturday afternoon. The trial was confined to vehicles carrying not less than two persons, owned and driven by members of the Automobile Club, or of affiliated clubs. Heavy leaden clouds ushered in the early hours of Saturday morning, and before the day was very old rain began to fall in pitiless torrents, accompanied by a cold driving wind. Before long London streets became a veritable quagmire, auguring very badly indeed for the state of the country roads. Under such unfavourable auspices, the question of abandoning the contest was seriously discussed in certain quarters, but on inquiry at Whitehall the idea was scouted. So, making the best of the unfortunate circumstances, the enthusiastic competitors braved the opposition of the elements, and put in an appearance at Sheen House, well within the appointed time. A representative of the *Motor-Car Journal* was accommodated on a smart Daimler $4\frac{1}{2}$ b.h.p. Kimberley voiturette, which attracted a great amount of attention along the route, Mr. A. Instone being at the helm.

On arrival in the spacious courtyard attached to Sheen House all was bustle. Seven out of the eleven competing cars had turned up; the absentees were Mr. Harrington Moore's Delahaye car, Mr. H. F. Mulline's Benz car, Mr. Ernest de Wilton's Cycle Components machine, and the Hon. Leopold Canning's Century motor-tandem. Under the supervision of their observers the drivers were filling to the utmost extent the running spirit tanks of their cars, preparatory to the run. When all were ready, it was discovered that the officials had not yet arrived. Then came a long and anxious wait. Drivers, observers, and passengers stood in the cheerless coach-house or out in the pelting rain gloomily discussing the tardy arrival of the officials. Suddenly an ominous rattle, accompanied by an uneasy grunt, was heard out in the road. A few minutes later an old Daimler public-service car, with strained spring, lop-sided, and with the near-side wheels making a double track, rumbled into the yard. Its appearance was almost greeted with a shout. One by one it disgorged its shivering, care-worn occupants, some of whom immediately withdrew to the Club for shelter. Lt.-Col. H. C. L. Holden, R.A., F.R.S., Mr. W. Worby Beaumont, Capt. Tulloch, R.A., and Mr. Johnson, the club secretary, the members of the Technical Committee, then examined the competing cars. By 3.20 p.m. all was ready, and the cars, with their complement, began to buzz away in the following order for the thirty-mile contest: Mr. S. F. Edge's $10\frac{1}{2}$ b.h.p. Napier, Mr. Edge driving, having on board Dr. Dawson Smith (observer), Mr. G. H. Smith, and *mécanicien*; Mr. W. Astell's two-cylinder 7 b.h.p. New Orleans, Mr. Astell driving, with Mr. H. J. Swindley as observer, and another passenger; Mr. F. A. Rodewald's 6 b.h.p. New Orleans, Mr. Rodewald driving, Mr. C. L. Freeston (observer), and passenger; Mr. T. B. Browne's 6 b.h.p. Panhard, Mr. Browne (driving), Mr. J. Lyons Sampson (observer), Mr. Martineau, and Mr. Loeffler; Mr. Percy Richardson's $6\frac{1}{2}$ b.h.p. Daimler, with *tonneau* body, Mr. Richardson driving, Lord Kingsburgh, the Lord Justice Clerk of Scotland (observer), Mr. S. Spooner and *mécanicien*; Mr. A. Burgess's 7.2 b.h.p. M.M.C. phaeton, Mr. Burgess driving, Mr. F. F. Wellington (observer), Mr. R. B. Bruce, and *mécanicien*. Mr. Roger E. Fuller's De Dion voiturette, *mécanicien* driving, Captain Tulloch (observer), and Mr. Gorham.

The route taken was by the Sheen House entrance of Richmond Park to Robin Hood Gate, and (still keeping in the park) to Kingston Gate to Kingston ($4\frac{1}{2}$ miles), Esher ($8\frac{1}{2}$ miles), Cobham ($11\frac{1}{2}$ miles). At the top of the hill after Cobham (Pain's Hill, under suspension foot-bridge) proceed straight on and take first turn to the right on the Weybridge Road. At fork, $1\frac{1}{2}$ miles farther, take right hand road for Hersham ($16\frac{1}{2}$ miles). Turn to right for Esher ($18\frac{1}{2}$ miles). Turn left for Kingston ($22\frac{1}{2}$ miles); over Kingston Hill by High Road for $4\frac{1}{2}$ miles, then turn left down Roehampton Lane. Then to left along Richmond Road and to left to Sheen House Club (30 miles).

Soon after the competing vehicles had set out on their thirty miles course there were indications of a slight change for the better in the weather. The heavy downpour of rain had gradually merged into a drizzle, and, as time went by, the sun managed to struggle through the heavy black clouds. But it was only a momentary respite, and once again it began to rain heavily. This last change was, however, of short duration, and before long the rain had again ceased and the clouds once more parted, disclosing a rift of brightness.

In the meantime members of the Club who had come down to Sheen House, but were not engaged in the actual run, had retired to the house, where an enjoyable time was spent until the buzz of an approaching motor-car announced the return of the first competitor. It was Mr. W. D. Astell's New Orleans, and the news was brought that Mr. S. F. Edge's Napier had a tire blown off on entering Esher. The other cars followed in quick succession, the Napier being the fifth to arrive.

The Technical Committee then began to test the amount of spirit consumed by measuring the amount of spirit required to refill the running tanks. The following figures represent the consumption of each car with its attendant conditions:—

Car.	B.H.P.	No. of Passengers.	Weight without Passengers.	Consumption.
Mr. Edge's Napier...	$10\frac{1}{2}$	4	Not stated.	1 5 $\frac{1}{2}$
Mr. Astell's New Orleans...	7	3	7 cwt.	1 0
Mr. Rodewald's New Orleans...	6	3	6 "	7.9
Mr. Browne's Panhard...	6	4	19 "	1 2 $\frac{3}{4}$
Mr. Richardson's Daimler...	$6\frac{1}{2}$	4	19 "	1 1 $\frac{1}{2}$
Mr. Burgess' M.M.C. phaeton...	7.2	4	19 "	1 2 $\frac{3}{4}$
Mr. Fuller's De Dion...	$4\frac{1}{2}$	3	8 "	1 1.1

All seats in competing vehicles had to be occupied by passengers having an average weight of not less than $10\frac{1}{2}$ stones each.

The following are the official notes of the run of each vehicle taken by the observer:—

Mr. F. S. Edge's Napier. Stopped on test hill in Richmond Park. Three passengers alighted. Passengers pushed to restart on hill. On Esher Hill, on return journey, front tire burst. Twenty-nine minutes' delay.

Mr. W. D. Astell's New Orleans. On test hill in Richmond Park, two passengers alighted on steep portion. No stops.

Mr. Rodewald's New Orleans. On test hill, Richmond Park, two passengers alighted on steep portion. One stop at Cobham to examine cause of rattle.

Mr. Browne's Panhard-Levassor. Took full load up test hill in Richmond Park. No stops.

Mr. Richardson's Daimler. On test hill, Richmond Park, two passengers out for five yards. No stops.

Mr. Burgess' M.M.C. Phaeton. On test hill, Richmond Park, three passengers alighted and pushed; stopped for three minutes, owing to a burner going out; one passenger alighted on hill into Esher on return journey.

Mr. Fuller's De Dion voiturette. On test hill, Richmond Park, two passengers alighted and pushed; no stops.

The average speed in every case was up to the legal limit of twelve miles per hour.

The Committee of the Sheen House Club kindly arranged as to the supply of petroleum spirit. Messrs. Carless, Capel, and Leonard, and the Anglo-American Oil Company sent free supplies of their respective spirits.

After the trials a dinner was held at the Sheen House Club. The Lord Justice Clerk of Scotland presided, and at the end of dinner pointed out that the moral of the trial should be taken to heart by members, namely, that it is possible to go a long distance on a very small quantity of spirit.

THE people of Newcastle are in a dilemma owing to a stoppage of the tram service. The lease of the tramway company expired last week, and the company were unable to enter into another contract with the corporation. The municipal cars are not expected to run before the end of this or the beginning of next year. This should be an excellent opportunity for the motor-car service which has just been started.

CONTINENTAL NOTES.

By "AUTOMAN."

EASTER has been, on the whole, fine in the Champagne country of France, where I have been staying a few days, making my headquarters at Reims: taking excursions in the neighbourhood with my old friend M. André Deck, who is Peugeot's agent for this district. Peugeot is the most prolific of all the motor-car manufacturers, his two immense works giving him such facilities of production. M. Deck tells me that this firm is turning out twelve motor-cars per day, and still cannot give immediate delivery of the most favourite makes; but what is most remarkable about Peugeot is the variety of types which he turns out—open cabs, closed broughams, wagonettes, tonneaux, spiders, court hansoms, landaus, any shape, eccentric or according to custom—all seem to come easy to him. You can have your motor in front or behind, just as you like. M. Deck took me out amongst the vineyards of Vergenay and Virzy (which give the bouquet to the best champagne) on his new 4 h.p. voiturette, and it certainly climbed the hills in good style and averaged a steady fifteen miles an hour. The roads in this part of France, as indeed nearly everywhere in the country, are wide and good, and the whole country is just breaking into spring.

MOTORISTS who desire to visit the district will find a good welcome for themselves and their cars and good accommodation at the Lion d'Or in Reims, which stands just by the fine old Cathedral and next door to the house where Joan of Arc stayed when she came there to cause King Henry to be duly crowned and consecrated, like his ancestor, King of France and Navarre.

THE German military authorities seem to be the first to have inaugurated seriously an automobile section of the forces, and they seem to have done it after careful study of the subject, and in a most practical way. The staff are to have special cars constructed to carry them about, and these cars are to be fitted with tables, so that whilst travelling over the ground the staff can study the plans of the country and thus make a further economy of time. Automobile armour-protected Maxim batteries, too, have been ordered, and also smaller cars, which will be used in order to rapidly verify the effects of cannon fire. It does not seem quite clear how this latter class are to be used, but I presume that they will observe the fire of the guns from different angles and quickly report the result. Some means will have to be devised to lay the dust for military motor-cars, for the small white cloud will render them quickly visible and excellent marks for the quick-firing guns; an automatic sprinkler should, however, be able to meet the difficulty, and then a low voiturette in a country of hedgerows or walls would not be easily distinguished.

M. LEON SERPOLLET gave an interesting lecture on automobilism in the Belgian Engineers' hall in Brussels last Saturday evening. In his remarks M. Serpollet, as could only be expected, gave the first place to steam, and cited the advantages he claims for it over its competitor, explosive gas. In his concluding remarks M. Serpollet told how he had driven King Leopold II. of Belgium in Paris, and how the King had recommended him to visit Brussels and give a lecture on the subject of the safety from accident secured by the greater power of quickly pulling up possessed by the motor-car over the ordinary horse-drawn vehicle—safety, not only for the occupants of the vehicles, but also for the pedestrians, who will be much less in danger when all carriages can stop as rapidly as automobiles.

SPEAKING of Leopold II., it seems that he has taken to driving his own car, and it is rumoured that he is to be seen flying up the hills on the Littoral at a great speed. He holds the record amongst kings, as none of the other Royal motorists seem as yet to have taken to the helm. We may yet live to see King Edward VII. driving Queen Alexandra through the Park.

THE Emperor of Germany has authorised the Duke of Ratibor, president of the German Automobile Club, to announce to the A.C.F. that he will offer a prize in connection with the Paris-Berlin race. This royal offer should give an additional stimulus to the event and the industry.

ITALY is now following the lead of the 1,000-mile Tour. There are already fifty competitors for the coming tour round Italy, and the Minister of War is sending two officers to accompany it and make a report.

MICHELIN continues his "Monday's" in the *Auto-Velo* this week by treating the question of the best way to preserve rubber. Light and change of temperature seem to be its two great enemies. Bright light acts chemically on rubber and hardens it, taking away all its elasticity. Sometimes, when outer covers have been left for a long time in a show-room window, they become hard and brittle like wood. It is the blue and violet rays of the solar spectrum which attack the rubber, the red rays having no action on it. Variations of temperature are the cause of an infinity of little slits, which day by day grow bigger and bigger until they render the objects useless. Rubber must therefore be kept in a dark place, in an even temperature. Moisture should be avoided, as it rots the canvas of the covers, though it has no effect on the rubber. A dark room in a house is the best place to keep your spare tires, the covers of which should be left wrapped up in the packing canvas. The inner tubes should be placed flat on the ground to avoid folds. All these precautions apply to new tires, those that have been already in use some days get less sensible to light and change of temperature. On coming in from a run the mud should always be wiped off the outer cover.

THE Automobile Club is organising a hill-climbing trial for July 6th next, open to all motorists.

THE members of the Irish Automobile Club will hold a run from Dublin to Delgany to-day (the 20th inst.), the out and home distance being thirty-six miles.

WE made a call at the London depot of the Hozier Engineering Company, in Baker Street, W., on Monday, and assisted at the departure by road of an Argyle 5 h.p. voiturette for Mr. Fisher, of Tollesbury, near Colchester. Another car was being despatched the same afternoon to Ealing.

AMONG the first to acquire one of the Excelsior motor-bicycles made by Messrs. Bayliss, Thomas and Co. was Mr. F. A. Wallen, of Dublin. The machine has up to the present covered over 600 miles, and has answered every test in a most satisfactory way. With regard to the dangers of side-slip, Mr. Wallen reports that his experience is that at a moderate rate of speed on the most dangerous kinds of greasy roads it is less liable to slip than an ordinary cycle.

THE Belgian Minister of Railways has decided that in future motor-cycles, if going by passenger train and accompanied by their owners shall be taxed as ordinary luggage. Unless the rules are strictly carried out, railways refuse to accept responsibility and will tax the motor luggage according to its weight plus 50 per cent. The charge is six centimes per 100 kilos per kilomètre, every additional ten kilos being subject to a further *pro rata* charge.

A SOCIETY of persons interested in petrol substitutes has been formed in Germany to encourage the invention of an article which can be used as petrol. The society has decided to organise an international competition, and to offer a prize of £50 for the best invention. Among the conditions are: 1. The substitute and its gases must not ignite and neither freeze nor explode when in common use. 2. It must not affect cloth, colours, or such tanks and tubes as it may come in contact with. 3. The cost must not be higher than for the ordinary article, and not be subject to so many market quotations. Particulars of the competition, which is open till the 1st July, can be obtained from Mr. G. Dreyer, of Hanover.

THE "LIGHT CAR."

THERE was a period in the automobile history of France when manufacturers were suffering from the "craze for lightness." The evil results of too light construction were not slow to make themselves felt, and as a consequence a reaction toward more substantial construction has now set in. No builder will now claim as an advantage that his vehicle is the "lightest ever built" or "weighs only so many cwt." Indeed, the name *voiturette* is to some extent becoming synonymous with frailty, insufficient power and other deficiencies, and for this reason the manufacturers building vehicles of more substantial construction—on carriage lines rather than bicycle lines—prefer to refer to them as "light cars." Many of the lighter and cheaper class of *voiturettes* are supported on wire wheels, are propelled by an air-cooled motor, and have practically no body except a sort of skeleton seat. The dimensions of the seat and of the space in front of the seat are generally very scanty, which make the vehicle most uncomfortable to the average person of generous build. It has only partially solved the problem, in many other respects falling short of the requirements of those who demanded lighter weight and lower price.

That this should have been the experience in France, where roads, as a rule, are very good, is, considers the *Horseless Age*, significant. The "light car" now produced by many manufacturers in France is, as stated above, more on the line of carriage construction than of bicycle construction, the principles of which predominated in the *voiturette*. From the heavy touring vehicle the light car is differentiated by its lower speed, smaller seating capacity, and consequent lighter weight. It is also considerably simpler in construction than the touring car. Whereas four-cylinder motors are now often used in touring cars, a single cylinder engine is the rule for the light carriage. There are fewer auxiliary devices, and the process of simplification has been carried right through to all parts of the vehicle. This simplification and lighter construction also give the "light car" an advantage over the touring carriage in the matter of appearance. It is less clumsy than the average touring car, and, at the same time, is devoid of the spider-like appearance of many of the *voiturettes*. The "light car," therefore, has many good features, and has certainly come to stay.

A FRENCH doctor has conceived the idea of fitting motor-cars with medicine chests containing everything necessary to render first aid to injured motorists.

THE Barford Street entrance of the Agricultural Hall will be available for private motorists during the period of the exhibition to drive their vehicles into, where they will be looked after and taken care of free of charge.

BARON DE KUSEL, writing from the Grand Hotel, Tunis, North Africa, to Mr. Roger Wallace, chairman of the Automobile Club, offers to place his services in Tunis at the disposal of the Club and individual members for motor-car tours in Algeria and Tunis. He speaks in the highest terms of the splendid roads which are available in that district, and states that there is excellent accommodation for cars, and also first-class European establishments where repairs of all sorts can be effected.

AN interesting little story comes from Mayet, a small town in France. It was in the early days of the motor car, when two inhabitants of the town purchased a couple of horseless vehicles. Either through ignorance or jealousy, the rest of the inhabitants rose in arms against the two *chauffeurs* and informed the local gendarmerie that the new vehicles were a nuisance and dangerous. In consequence every gendarme was on the *qui vive*, and no sooner had one of the poor motorists appeared riding through the streets on his car than he was pounced upon by one of the gendarmes and charged with furious driving. At the court, the gendarme, swelling with pride, gave his version of the affair, but, unfortunately for him, it was shown that the carriage could not run at more than fifteen kilometres an hour. The gendarme retired from court "a sadder but wiser man."

THE LOMBARD MOTOR-COOLING DEVICE.

WHEN visiting the London Autocar Company's dépôt the other day, Mr. Rush showed us a new motor-cooling device which he was fitting to a motor-tricycle. Instead of fitting small motors with a water-jacketed combustion chamber, M. F. Lombard, of Paris, the maker of the new device, introduces water, drop by drop, into the *culasse*. Fig. 2 gives a sectional view of the apparatus and Fig. 3 an end view. In addition to being employed to introduce the water, it is also arranged to take the place of the usual compression cock, it being screwed into the motor head. A small circular tank of a capacity of

FIG. 1.—FRONT VIEW.

half a gallon of water is used in connection with the device, this being attached below the saddle, and is sufficient for a run of 125 miles. The tank is connected by piping to the joints R and H. A small drop of water from the tank enters by the pipe R to the three-way tap E, and thence under the ball B, and enters at each stroke of the motor into the combustion chamber, where the water is converted into steam. The screw V requires regulating once for all to allow a flow of water according to the

FIG. 2.—SECTION.

FIG. 3.—END VIEW.

size of the motor. To use the apparatus it is only necessary to open the tap E; when this is closed at R the water returns to the top of the tank by the pipe H. The vaporation of the drops of water is claimed to be sufficient to prevent the over-heating of the internal walls, and to maintain an equal temperature, while it causes no deterioration of the cylinder. C is the usual compression cock, which is opened and closed in the ordinary way. The apparatus, which occupies but a very small space, is made in two sizes—one for motors up to 3 h.p. and one for engines of from 3 to 6 h.p.

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE Lord Justice Clerk is *facile princeps* as a shrewd observer of the features of road traffic. Every participant in the 1,000-Mile Trial will remember his weighty advocacy of the motor-car as a vehicle under the most admirable control and the graphic way in which, both at Manchester and Edinburgh, he declared his willingness to stand within a few feet of a car approaching at the rate of fifteen miles an hour. On Saturday Lord Kingsburgh acted as an official observer at the Automobile Club's petroleum-spirit trials, and utilised the oppor-

DESPITE all that has been said to the contrary by anti-automobilists, it is a perfectly fair statement to lay down that in ninety-nine hundredths of all the cases of actual fright that have ever occurred the fault has rested entirely with the driver of the horse. Either he has himself incited the animal's fears by his own mismanagement or he has brought out a quadruped which he knew beforehand to be totally unfit for road use. When a horse shies at your car you may wager your last shilling that that animal has shied at other things before ever it set eyes upon yourself, and that its owner is consciously employing what he well knows to be a menace to the public safety.

A NEW FOREST incident which has been described to me by

MR. H. EDMUNDS AND PARTY AT STONEHENGE.

THE AUTOMOBILE CLUB'S EASTER TOUR (see last issue).

[Mr. Howard Edmunds.

tunity of "observing" other matters by the way. In the course of the thirty miles journey of the car on which he sat he counted no less than fifty-three horses that were left unattended, in flat defiance of the law. Apart from the flagrant illegality of the conduct of every one of the drivers concerned, how forcibly this computation of Lord Kingsburgh's illustrates the hollowness of the contention that motor-cars are a perennial source of fright to horses. Now that motor-cars are a constant feature of Surrey roads, how could horse-drivers dare, to the tune of fifty within two hours, leave their animals unattended if the passing of a car meant certain fright?

Mr. F. A. Rodewald shows how the would-be biter may himself be bitten. Mr. Rodewald was starting from Lyndhurst for a drive on his 6 h.p. air-cooled New Orleans, and found some difficulty in getting past a big coach which barred the way. The coachman obstinately declined to make room in answer to the sound of Mr. Rodewald's horn, while the "boots" kept up a running fire of what he regarded as facetious comment on the car and indulged in mimicry of the noise occasioned by the motor. A quieter car, however, could hardly be conceived, for it has twin cylinders and is belt-driven. Eventually, however, Mr. Rodewald managed to scrape by, and then the off-leader, a

young and untrained animal, began to plunge. Apparently the coachman was more adept at blocking other people's progress than managing his own team, for he rolled right off the box, his fall being broken by contact with the wheel. The horses now scampered off into the Forest, with a full load of passengers, and the only individual who had pluck and presence of mind enough to do anything was Mr. Rodewald's fellow-passenger, who jumped from the car, chased the coach, and succeeded in checking the runaways. Meanwhile, of course, the car had been brought to a full stop, and—such is human gratitude—Mr. Rodewald was promptly visited with a torrent of vituperation by the proprietor of the coach, who, instead of helping to catch his horses, stayed behind to curse motor-cars in general and the New Orleans in particular. When it is remembered that automobile services have now been running in Bournemouth for months, and that no difficulty whatever stands in the way of training the horses of the neighbourhood, the culpability of the owner concerned is only too apparent, and scarcely seems to be excused by indulgence in blind rage and vitriolic invective.

PROBABLY the saving grace of humour would prevent an exhibition of this sort, but too many of those who drive animals seem only capable of flogging and cursing. It is a treat at times to see a horse well handled, but too often the driver insults the animal in the shafts by crediting it with a stupidity equal to his own. What earthly good does it do to "jag" the reins just at the moment when the beast wants calming? On the last day of the Easter Tour, for example, four cars were standing on the roadside between Bagshot and Virginia Water while the owner of one was repairing a broken chain. A pony-trap came by, and the driver began objurgating the owner of the foremost car for no imaginable reason, and used the customary kind expressions as to "them things having no right to the road." I got down and took the pony's head, and led the animal past each of the four cars in turn. In each case it was passing quite calmly, when the driver jerked the reins, with the result that it took all my strength of wrist to keep the pony quiet. Not only was the jerking absolutely superfluous, but it was definitely provocative as well. Properly handled the pony would have passed the cars without any outside assistance, but even with the latter the senseless pulling at its mouth made matters difficult.

THE only display of humour that I have ever seen on the part of the occupants of other vehicles than motor-cars was one encountered on the previous day. While on the way from Bournemouth to Salisbury we saw an uplifted hand, or rather four hands in line. The natural impulse was to stop the car, but a second look revealed one of the most comical turnouts ever seen outside the New Cut. A donkey of Lilliputian dimensions was dragging—no less than four men in a home-made vehicle scarcely bigger than a child's wheel-barrow. They were closely packed in Indian file and clinging to each other's shoulders, and, not in any spirit of malice, but out of humorous appreciation of the irony of the situation, they each held up a hand lest haply their mettlesome steed should be scared. And as the car sailed by a jocular remark anent "twelve an hour" followed us on the wind, and showed how well posted in the law were these humble claimants of their rights.

If a bombshell had fallen into the Automobile Club the other evening it could hardly have created more surprise than the sensational announcements of Mr. Engleheart, a member who had been over to Paris to view a new type of motor, which has been put forward since the recent show. There were only half-a-dozen members present, and the situation lacked something in dramatic completeness as a consequence; but the said half-dozen are not likely to forget the high tension current with which the atmosphere was charged for the time being. Not that Mr. Engleheart was striving after an effect. His tale was told quietly enough; it was the details that were dramatic. We fairly gasped as he recounted how that he had seen a motor placed upon the floor and running up to three thousand revolutions

a minute, so that it set everything around reverberating with the clatter, and yet—*mirabile dictu*—so perfect was the combustion that he could put his hand within six inches of the exhaust, and lo, there was no heat. For the present the name of the inventor must remain a secret, and likewise the means by which such marvellous results have been achieved; but this much may be added, that crude petroleum, not petrol, is employed; that lubrication oftener than once in six months is not required; that piston, cylinder, and valves alike remain unaffected by deposits; and that the car to which this extraordinary engine is fitted can be driven by one switch, at any required speed, and even reversed as well. It was a fairy tale in sound, but not in fact; for engineers—and Mr. Engleheart is one—are not given to romancing in that fashion. Meanwhile we await a solution of the mystery. It may not be long, however, before our curiosity is satisfied. I understand that Mr. Edison's Paris agent has seen the new motor and reported very favourably upon it, and that Mr. J. S. Critchley and a representative of the Vickers-Maxim firm have both crossed the Channel on a visit of inspection.

ACCORDING to the *Observer*, which published some interesting notes on automobilism last Sunday, the 6 h.p. car which was built for the Prince of Wales's trial by the Daimler Company, has now passed into the possession of Lord Hastings, at the price of £700. It is a welcome sign of the times, by the way, that so staid and respectable a journal as the *Observer*, a paper which is older than the *Times* itself, should recognise the position which automobilism has now attained, and devote space to what appear to be—and, we trust, will be—periodic notes upon the subject.

THE PEUGEOT COMBINATION TUBE AND ELECTRIC IGNITION.

IN a recent issue we referred to a new Peugeot voiturette we had inspected at Messrs. Friswell's dépôt, the two-cylinder engine of which was fitted with both tube and electric ignition. We are now able to give an illustration of the arrangement adopted. The picture shows the explosion chamber

end of the two-cylinder motor. It will be seen that there is only one burner, centrally located, for the platinum tubes of the two cylinders, the sparking plugs being located one at each side. The whole device is so arranged that either form of ignition may be used separately or both together at the will of the motorist.

WITH reference to the toll-keeper's little difficulty at Gainsborough, as reported in our last issue, Mr. Archibald Ford, of the Liver Motor Dépôt, Liverpool, informs us that, having occasion the other day to send one of their drivers across the ferry between Liverpool and Birkenhead with a car, he succeeded in getting the old Scotch ticket man to pass it as a "hand cart!"

CORRESPONDENCE.

STRAPS FOR MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue Mr. Leonard advocates the use of "Collan" oil on the straps of motor-bicycles. May I corroborate his experience of the last two months by the results of mine, extending over nearly two years? Ever since I first rode my first Werner I have used oil on the strap, but I must admit that whenever I have mentioned the advantages to be derived by its use my account has been invariably received with an incredulous smile, even by Messrs. Werner's men in Paris. Personally, I have always used castor-oil, which gives the leather almost the adhesive qualities of india-rubber, so that the tension need not be so great (it is almost loose, even), and, therefore, the friction and consequent wear of bearings is greatly lessened. Probably "Collan" oil, being a special preparation, of which I had not heard till last week, is superior. If my further experience of the Werner machine, which has carried me about 1,000 miles since I last wrote, and that unfailingly, be of any use to those who still doubt the practicable nature of this sturdy little "beast," as Mr. Pennell called it, I believe, undoubtedly, weight for weight, the fastest and most powerful automobile which exists, I take the opportunity to say that it remains as satisfactory as before. A little while ago two litres (i.e., 3.52 pints) of petrol carried me eighty miles at an average rate of seventeen miles an hour. Now, at 1s. 3d. per gallon, that means 12.1 miles for one penny. No one could reasonably reproach it with gobbling up much petrol, at that rate! A careful attention to the throttle-valve and advance-lever procured the above result. I find the machine easily outstrips the average voiturette, both on the level and up hill, and as for the overheating which is always suggested to me, I may say I never saw, nor heard of; the least symptom of such an event—thanks to the excellent design and position of the motor—and also, no doubt, to the use of "D" oil. I consider that there is no question of the Werner being by far the best-designed motor-bicycle yet made, and have acted upon my belief by buying two, and I hope to get a third when an improved model is to be had, and doubt it soon will be, for the French are ever hard at work with their ingenious minds. I am further convinced that there is great danger in attaching a sufficiently powerful motor and its accessories to an ordinary bicycle, which was never designed to withstand these extra strains, and those who contemplate doing so cannot be too earnestly warned against the consequences of setting such forces at work, for very surely they are running the most serious risk in riding such a machine.

Yours truly,

A. L. BENETT.

UNATTENDED HORSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Acting as an observer on a car competing in the petrol consumption test last Saturday, I took the opportunity for noting on the thirty-mile run, the number of horse vehicles left unattended on the road. The total was fifty-three, of which eight, at least, were cases where the drivers were in public-houses. In several of these latter cases, there were teams of three horses. In addition there were four horses running loose. This suggests a legitimate matter for police energy and county council consideration.—Yours truly,

J. H. A. MACDONALD.

GEARS AND IGNITION FOR MOTOR-QUADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Chum" were to measure the size of his engine he would find it had a longer stroke than bore, which makes it a slow-speed engine, and if you give it a load to push when running slow it will push it but will not do so when running fast. With eighteen tooth pinion on, the gear is not high enough to keep the machine running sufficiently steady to act as an efficient fly-wheel; consequently, when it comes to a hill the

engine slows up, gives a few spasmodic kicks and stops. If you had a higher gear the engine would slow down to the speed at which it gives most power while the machine keeps running at a steady pace. I do not know whether I have made my meaning sufficiently clear or not, but if "Chum" or anybody else who has the same trouble cares to communicate with me I will prove it with a tricycle fitted with what I believe to be the best engine made—an Allard.—Yours truly,

G. T. TAYLOR.

A MOTORIST'S QUANDARY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader, believing your journal is intended as a guide to would-be users of motors as well, of course, as a medium for the trade, one is surprised to find, in the advertisements, threats against buyers and users. You buy an engine stamped De Dion, if not bought through certain agents, it's an infringement; a certain carburettor attached to same, tires ditto, etc., etc., and are to be restrained. It strikes the novice who has bought at fancy prices that all these things cost so much above intrinsic worth because of their being patents, and that it is not his business any further. At the same time he is in a glorious state of uncertainty. Have I bought from right parties the right thing?—and not only this but it opens an apparent scheme of blackmail amongst agents, etc. I am told by advertisement in a recent issue that if I buy a Serpollet car in France I should not be allowed to run it in England, and suppose, as a natural sequence, that a car bought in England would not be allowed to run in France. If this is the law, why not extend it to reaping, mowing, sewing machines, etc., bought abroad.

I reckon the Americans would not try to run an industry to successful issue on such lines, but on the substantial improvement each maker invents. These quarrels amongst makers are causing an immense amount of injury to English makers by creating in the minds of would-be purchasers a feeling of insecurity and inconvenience.—Yours truly,

A. KENT.

THE NESSELSDORF STEERING GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of 2nd March, we notice a letter from Mr. Kermode concerning the spiral grooves steering mechanism for motor-cars for which we obtained a Hungarian patent on 23rd July, 1900.

We have never heard of Mr. Kermode's steering mechanism, so that we are very much surprised to hear that this gentleman claims priority for this device.

In the letter Mr. Kermode does not mention the date of his patent, therefore we cannot state if his patent was granted before we applied for ours. Further, it is not possible to state if Mr. Kermode's steering system, used for steering apparatus on steamers, is identical with our system used for motor-cars, for the little drawing, without any technical description, gives no information in this respect. If Mr. Kermode will furnish the proof that his system is identical with ours and that he has applied any patent for the same purpose previously to us we are ready to draw back our patent immediately. At the same time we have the impression that there is an essential difference between Mr. Kermode's construction and ours.—Yours faithfully,

DER NESSELSDORFER WAGENBAU-FABRIKS-GESELLSCHAFT.

ASTER AND DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Canning's letter in your issue of March 30th can hardly be allowed to pass without notice. In comparing the De Dion and Aster motors, I can hardly help but think that he has allowed his enthusiasm for the particular type of motor used by him to warp his judgment, or possibly his experience with the De Dion-Bouton engine has not been of sufficiently long duration to enable him to have appreciated one or two of the points which have made the De Dion-Bouton engine superior to any other make.

Dealing first with the question of ignition, one of the beauties

of the De Dion engine lies in its absolute range of speed from 200 or 300 revolutions up to 3,000 revolutions a minute; the sparking and firing are equally certain, and the range is one which has never yet been equalled by any other make of motor. In regard to the actual contact breaker, it would probably be interesting to have the experiences of some practical users who have tried both systems. Mr. Canning may revel in the simple adjustment of the type adopted on the Aster, but possibly we are not all so expert in the re-adjustment, and after a very extensive experience with both types there is no doubt in my own mind that whereas the De Dion contact can be adjusted by any ordinary individual, the adjustment of that on the Aster requires much more delicate and careful attention. In fact, in regard to the proper adjustment of the sparking device, this is, in my opinion, one of the points where the Aster does not score.

Then, again, the trembler used by Messrs. De Dion and Bouton has ignition advantages over the ordinary type of make and break device, which only those of us who have ridden far can appreciate. Particularly have I noticed this in racing, and as I have raced on both types of motor perhaps my opinion may be of value. Surely Mr. Canning does not suggest that the De Dion-Bouton engine is made other than perfect in workmanship.

It is rather difficult to disprove facts, and the reputation and performances of the little engines built by Messrs. De Dion-Bouton and Co. speak for themselves.—Yours truly,

CHAS. JARROTT.

MOTOR-STABLING CHARGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel obliged if any of your readers would give me information as to the usual charge of stabling motors per night on English roads. I was unfortunately obliged to stop a night last week owing to tire troubles at "The Swan," Alresford, and was surprised, on paying my bill next morning, to find that 5s. was charged for housing my voiturette. This I thought exorbitant, but paid it and resolved through the medium of your journal to obtain information as to what is usual. In the interest of motorists generally I hope you will publish my letter so that answers may possibly be obtained from others who have already had touring experiences in England.

Yours faithfully,

ALBERT HOOD.

THE WEAR OF PNEUMATIC TIRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On the subject of the wear of pneumatic tires, referred to in your last issue, surely the short life of the back tires as compared to the front is to be accounted for by something more than the mere extra weight they have to carry. Is it not rather owing to the back wheels being the driving wheels and their rubber treads being dragged over the road surface, not rolled over it, whilst the internal heat too thus generated by the friction is surely a not unimportant factor in the work of destruction?—Yours faithfully,

G. H. SMITH.

THE CONTROL CONTESTS AT THE CRYSTAL PALACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the happy possessor of a Locomobile steam-car, also a 4 h.p. De Dion voiturette, and looking over the programme of the motor-car contests at the Crystal Palace on Saturday, the 27th inst., I note that there are sections for steam-cars and electric vehicles. It has occurred to me that, in all fairness to the little steam-car, there should be an open competition in which both steam and petrol vehicles may be allowed to compete. I was very much surprised at the splendid time that Mr. Letts's Locomobile did the exhibition mile in at the Crystal Palace on Easter Monday, and it is my belief that for short distances these little steam-cars can beat any type of car at present on the market. Therefore, I would like to see them have a fair chance in the forthcoming contests. I am afraid that I, myself, will be

on the Continent, or should have been delighted to have taken part and have shown to my friends what can be done with a small 4 h.p. steam carriage.—Yours truly,

FAIR PLAY.

A PNEUMATIC TIRE REMOVER.

ONE of the most disagreeable accidents that can happen to the driver of a motor-car is to find the outer cover of a pneumatic tire firmly fixed to the rim when it is necessary to remove it for repair. The wooden levers usually employed are frequently found to be insufficient to remove the covers of heavy motor tires, so that a brief description

of the device which has lately been put on the market by a French firm may not be without interest. This apparatus consists of a stirrup piece A, having at one side a notch B to fit the rim and at the other a boss through which is screwed the spindle D. This screw terminates in a button E, in which it turns easily. On fixing the device, as shown in the illustration, and screwing up, the most refractory cover can be removed, even if it is fixed all round the rim. It is also useful for replacing the cover. The part already in place, which has always a tendency to leave the rim, can be kept in position. It can also be used as a press when putting on a patch. The apparatus is being made in two sizes, one for motor-cycle rims and for tires up to 65 mm. and one for wooden wheels and tires up to 90 mm.

DURING the recent Automobile Club tour, a Mo-car was observed running about in Salisbury town.

It is reported that King Edward is to have an automobile specially retained for his use when on the Continent, and that the machine is to be kept at Brussels.

CAPTAIN PRETTY, of Ipswich, rendered considerable service with a Gobron-Brillié motor-car in connection with the transport department of the recent Easter volunteer manoeuvres.

MR. ARGENT ARCHER, the well-known photographer, has been appointed official photographer to the Automobile Club Show at the Agricultural Hall.

THE Eastman Automobile Co., of Cleveland, Ohio, are making a speciality of metallic bodies for steam motor vehicles. The bodies are claimed to be noiseless, incombustible, and practically indestructible.

At a special meeting of the English Motor Club it was decided to award a gold medal to the winner of every competition in the Control Contests at the Crystal Palace on the 27th inst., provided there are not less than five entries. In addition there will be certificates for all who successfully run through their competitions. Monday next, the 22nd inst., is the last date for entries.

THE Boron Battery Electric Supply Co., of 131, St. Domingo Road, Liverpool, have forwarded us a circular on their Selenio Phospho Accumulator. These accumulators consist of single cells giving two volts each, and are usually supplied in four-volt sets, consisting of two cells in a light wooden tray. Any number of cells can be used if greater power is required.

WHILE touring recently in the New Forest we had the opportunity of riding behind a Singer motor-bicycle. The roads were extremely heavy, and some of the gradients stiff, yet the rider all the time he was in view was never observed to pedal once.

THE DOCTORESSE MOTOR-CAR.

LA SOCIÉTÉ FRANÇAISE D'AUTOMOBILES (GAILLARDÉT), of Suresnes, near Paris, have lately introduced a new type of "Doctoresse" car, of which we are this week able to give illustrations. The frame of the car is built up of channel steel, and carries the whole of the motor and transmission mechanism, so that any type of carriage body can be fitted. The frame is suspended by springs on the axles both

FIG. 1.—SECTION OF GAILLARDÉT 6 H.P. MOTOR.

fore and aft. The engine (Fig. 1) is of 6 h.p.; it is of the single cylinder vertical type, and balanced by means of counterweights on the flywheel. There is also a regulator, allowing the speed to be gradually increased from 600 to 1,600 revolutions by acting upon the exhaust valve. The motor is, of course, water jacketed, and in the event of the pump failing to act, the water would continue to circulate by gravitation. Furthermore, if from any other cause the jacket should be deprived of water,

FIG. 2.—SECTION OF GAILLARDÉT VARIABLE-SPEED GEAR.

and the motor reaches a certain temperature, a fusible plug communicating with the combustion chamber melts, and the motor stops before there is any danger of "gripping." The charge is fired electrically, or by incandescent tube, or both as desired, the latter method being recommended so that one may replace the other in case of derangement.

Two speeds and a reverse motion are provided, the power being transmitted from the motor shaft to the counter shaft by means of a belt running on fast and loose pulleys. There are three pulleys on the counter shaft, Fig. 2, the central one being loose, and the two outer ones fast. The latter are mounted on separate concentric shafts, on the inner ends of which, in a gear box, are pinions continuously in mesh with corresponding spur wheels surrounding the differential gear on a parallel shaft. From the latter the usual chains and chain-wheels transmit the power to

the rear-road wheels. M. Gaillardet claims that he has overcome the drawbacks of belt-driving by ensuring a proper protection against mud and by regulating the tension in such a way that the slipping during normal working never exceeds 5 per cent.

The 6 h.p. car weighs complete about 14 cwt. The road wheels are of wood with metal hubs, all four being of equal diameter, and shod with 65 mm. pneumatic tires. Inclined wheel steering is fitted, while ample brake power is provided. The company are also building a faster car on similar lines, but with the parts correspondingly stronger; the motive power in this case being supplied by a two-cylinder engine developing 12 h.p.

THE FUTURE OF THE MOTOR-CAR.

THE future of motoring and the motor-car, writes Mr. Jefferson Seligman in *Automobile Topics*, is so large a subject that in the limits of a brief paper one scarcely knows where to begin. The first question asked in regard to any new enterprise, whether it be in connection with business, recreation, or pleasure, is—"Do the advantages compensate for the disadvantages?" If all the automobilists in this country could be gathered together in one place and the above query propounded, probably seventy out of every one hundred would answer with a decided "yes," 20 per cent. would beg to be excused from committing themselves, as their minds are in a state of suspense, and the remaining 10 per cent. would answer with an emphatic "no." A good many people say that the automobile is not yet perfected, and that when it is perfected, then they will go in for the sport. There are a good many who for years have been saying the same thing about the bicycle, and to this day they are without a machine. Those of us who want to enjoy the sport of motoring cannot afford to wait till the horseless vehicle is perfected before entering upon its enjoyments. The question then narrows itself down to this: "Does the excitement and pleasure which come from operating a good up-to-date motor-car, imperfect as it is, compensate for the crudities, disadvantages, and failures to 'mote' which are at present characteristics of some motor-cars?" Notwithstanding the drawbacks, the consensus of opinion to-day is in favour of the motor-car. It has come, and it has come to remain. The awkwardness, crudities, and imperfections of the present-day machine will disappear. The automobile to-day is just about where railroading was at the beginning of the last century, or where cycling was twenty years ago. Give the mechanic five years more and he will produce a machine that will be the surprise and envy of the world. There are more bright minds concentrating their thoughts and best efforts on the problem than on any other in the line of mechanics. Can we doubt the result? To do so would be to disregard all mechanical history of the past.

THE Dutch military authorities have decided to employ motor traction for guns and ammunition waggons within Amsterdam's fortification boundary.

THREE prominent owners of coffee estates in Nicaragua have petitioned the Nicaraguan Government to grant them twenty thousand dollars in instalments to help them to repair the road between Matagalpa and the National Railroad at Monotombo (a distance of eighty miles) in order to run a motor service between the two places. The petitioners state that owing to lack of proper transport, nearly a quarter of the coffee crop in the district was spoiled last year.

THE first *chauffeur* to express his intention of entering in the speed and endurance test from New York to Buffalo, under the auspices of the Automobile Club of America, is Mr. McCurdy, manager of the Motor Vehicle Company's depot in Philadelphia. Mr. McCurdy is one of the most expert drivers of an automobile in America, and for this contest will have a specially built racing steam-car of great horse power, petrol and water carrying capacity.

HERE AND THERE.

Two ladies on motor tricycles were seen out at Potter's Bar at Easter.

THE *Spectator* considers that in five years' time, if motor-cars are given fair play the public will admit that they are far safer for all concerned than horse-drawn vehicles.

A 24-h.p. Daimler car is being sent out to Spain to the order of the Marquis de Tovar. The car will during the coming season be entered for most of the tourist races in France.

DURING the Easter military cycling manoeuvres, a motor-car was fitted as a coffee-stall, and dashed along the country lanes and highways, bringing warmth and refreshment to many a weary, rain-soaked outpost.

MR. BASIL H. JOY, who will be remembered in connection with the Richmond Show and some of the official trials connected with the Automobile Club, has consented to take charge of the arena during the Club Show at the Agricultural Hall.

TODAY, the 20th inst., there will be a run of the members of the Automobile Club to Dunstable. The start will take place from the Club at 2.30, and the route will be by Edgware Road, Elstree, and St. Albans. A dinner at the Sugar Loaf Hotel will follow in the evening.

WE have just received a copy of the 1901 edition of Kelly's Directory of Merchants, Manufacturers, and Shippers of the World. This directory has become of such importance to business men as to be an absolute necessity in every up-to-date commercial house. It contains a long list of motor-car and carriage manufacturers, which has increased remarkably in length during the past few years.

UNDER the title of the Long Island Traction Co., and with a capital of twenty thousand dollars, a company has been formed in America to work a motor stage or omnibus route upon the main highways connecting the various villages and the town of Hempstead with Mineola, Nassau Co., and with New York City at Springfield, Queens, and Rockaway.

DR. STEDMAN, the American doctor who recently performed a surgical operation in light furnished by a bulb attached to the storage battery on his motor-carriage, has had made a regular outfit for use in this direction. It consists of sixty feet of electric cord and half-a-dozen lamps. The doctor never goes out but what he carries this apparatus with him on his car.

A PHYSICIAN practising in one of the suburbs of New York has used a petrol motor-car for two winters, having bought his first machine in 1898 and another one in 1899. His repair bills to August, 1900, had been £38, and from then up to the present £12, the latter including a set of new wheel rims. The care and keep of a horse per month is, he states, £12, while that of a motor-car is only £2.

ALTHOUGH there have been a number of runaways and collisions since the first motor-car appeared on the streets of Chicago, only twelve accidents in which anyone was actually injured have occurred, and not a single death has resulted. In order that the city authorities may have a complete record of all accidents in the future, everyone who takes out a licence is now required to give an undertaking that in case of any mishap he

will make a detailed report of the occurrence to the City Electrician.

AN American contemporary states that the Duke of Manchester is at present having a racing machine built that the makers claim will travel at the speed of 60 miles an hour. It is to be pointed at both ends like a torpedo, with a hood to protect the driver from wind and dust. In the fore part will be placed the petrol tanks, and in the rear a large water tank. The Duke hopes ultimately to break a record, but in the meantime he and his Duchess have been driven down to Kimbolton by motor-car by Mr. Moffatt Ford.

IN the course of a control demonstration at the recent automobile exhibition in Chicago an unusual feat was accomplished by an expert *chauffeur*. He closed the lid of a watch by backing a heavy motor-vehicle upon it. The watch, with the lid open, was placed on the ground on one side of a scantling. The motorist mounted his seat and backed the vehicle up until it climbed the scantling. With hand on brake, the driver allowed the rear wheel to drop gently on to the watch. It touched the lid and closed it, at the same time cracking the crystal. Just as the vehicle was about to crush the dainty bit of jewellery the lever was reversed, the car started ahead, and the watch was saved.

AN exhibition of automobiles was opened on March 22nd last at the Coliseum, Chicago, U.S.A. Several of the exhibitors had machines in operation on the track for the accommodation of visitors, and extensive use was made of the opportunity thus offered of comparing the merits of the different types. Vehicles of every description, from a petrol motor-bicycle to an electric 'bus, were to be seen in operation. Among the novelties was the skeleton of a Milwaukee steam-car, showing the mechanism in detail. This ran about the track during the exhibition, just to prove that it was the real thing, minus the body.

FIG. 3.—THE DOCTRESSE CAR (See opposite page).

WE learn that Messrs. Shippey Brothers, of King Street, Cheapside, E.C., have been appointed sole European agents for the sale of the new standard Milwaukee steam cars, Milwaukee steam wagons, and other engineering specialities, as manufactured by this well-known firm. As soon as financial arrangements have been completed, Messrs. Shippey intend to open branch sale depôts in Paris, Brussels, Berlin, Amsterdam, Lisbon, and other Continental cities, for the sale of the steam Milwaukee cars, the Ideal storage battery, Still electric vehicles, and Still carriage motors, controllers, and gearings, as now manufactured in England under royalty.

THE British Power, Traction, and Lighting Company, Limited, of York, have forwarded us an illustrated booklet on the "P.T.L." Gardner-Serpollet steam automobiles of which they are the sole manufacturers in Great Britain. The booklet, which is a veritable work of art, contains numerous illustrations of their vehicles. As a frontispiece, it has the photos of prominent members of the firm, including those of M. Léon Serpollet, President of the French company, Mr. F. L. Gardner, Mr. Geo. Hopkins, and Mr. A. E. Hodgson, chairman of the English company. The reading matter is written in an attractive form, whilst small corner pictures of rural scenes greatly add to the beauty of the pages.

THE PARIS-ROUBAIX ALCOHOL MOTOR TRIALS.

THE double event of the Paris-Roubaix alcohol automobile race was finished on the 8th inst. at the Roubaix end, the "two-day" contestants, who on the previous Sunday went as far as Amiens, and the "one-day" contestants, who left the Place de la Concorde, Paris, on the morning, reaching the common destination at various hours. The race was organised by the *Auto-Vélo*. There were altogether eighty-three entries of all types, scarcely a manufacturer of any reputation being unrepresented, the cars including heavy cars, light cars, voiturettes, motor-cycles, quadricycles, etc. The classification was as follows:—

(1) For those using pure alcohol; (2) 75 per cent. or more of alcohol; (3) at least 50 per cent. of alcohol, this being the maximum amount of mixture allowed under the rules. The following is the official classification:—

Number.	Make.	Driver.	Consumption.
---------	-------	---------	--------------

CATEGORY A (QUADRICYCLES).

1	De Dion...	Cornier ...	7 lit. 250
2	Werner (<i>tandem</i>) ...	Cousin ...	10 500
3	De Dion...	Osmont ...	22 459

CATEGORY B (VOITURETTES WEIGHING UP TO 250 KILOS.).

No arrivals.

CATEGORY C (VOITURETTES, 250 TO 400 KILOS.).

1	Darracq ...	Théodore ...	18 lit.
2	G. Richard ...	Moncet ...	19 600
3	Renault ...	Declercq ...	22 800
4	G. Richard ...	Morin ...	28 859
5	Brierre-Cottureau ...	Moussy ...	33 750
6	Decauville ...	Page ...	37 250

CATEGORY D (LIGHT CARS, 400 TO 650 KILOS.).

1	Gillet-Forest ...	Mégnin ...	22 lit. 850
2	Darracq ...	Marbais ...	23 300
3	Clément ...	Tart ...	26 500
4	Soc. Ind. Téléphones ...	Valentin ...	27
5	Noé Boyer ...	Cordonnier ...	30
6	Brierre ...	E. Brierre ...	30 200
7	Noye Boyer ...	Duanip ...	32
8	Turgan et Foy ...	Turgan ...	32 500
9	Bégot et Cail ...	Perez ...	32 625
10	Decauville ...	Théry ...	36 750
11	Brierre ...	Sanz ...	42
12	Decauville ...	Uhlman ...	64 450

CATEGORY E (CARS, 650 TO 1,000 KILOS.).

1	Delahaye ...	Doyer ...	24 lit.
2	Delahaye ...	Pangoy ...	27
3	Bardon ...	Danette ...	29 859
4	Panhard et Levassor ...	Girardot ...	31
5	—	Aristide ...	31 750
6	—	Baudouin ...	32 300
7	Bronhot et Cie ...	Maréchal ...	34 500
8	Vilain Frères ...	Briest ...	34 600
9	Gobron-Brillié ...	Rigoly ...	35 700
10	Bronhot et Cie ...	Charbonnier ...	36 400
11	Gillet-Forest ...	Le Blond ...	38 500
12	Peugeot ...	Barras ...	45

CATEGORY F (HEAVY VOITURETTES, ABOVE 1,000 KILOS.).

1	Société Nancéenne ...	De Ponton d'Amécourt ...	33 lit.
2	Delahaye ...	Varlet ...	34
3	Panhard et Levassor ...	Schaffer ...	39 450
4	Société Nancéenne ...	Brillié ...	41 750
5	Delahaye ...	Perrin ...	42
6	Bolleé ...	Martha ...	42 500
7	G. Richard ...	Le Saout ...	43 500
8	Bronhot et Cie ...	Belleville ...	46
9	A. Bolleé ...	Loysel ...	48 700
10	Gobron-Brillié ...	Berruë ...	50 500

CATEGORY G (COMMERCIAL VEHICLES CLASSED ACCORDING TO USEFUL LOAD CARRIED).

1	Georges Richard ...	Letellier ...	70 lit.
2	Bardon ...	Rost ...	49

The Richard car carried 650 kilogs. of goods equal to 11·600 litres per 100 kilogs., while the Bardon carried 300 kilogs. equal to 16 litres per 100 kilogs.

SPECIAL HILL-CLIMBING AND CONSUMPTION TRIALS.

WE are requested by the secretary of the Automobile Club to remind companies, firms, and individuals who will be exhibiting motor-vehicles at the Automobile Club's Exhibition at the Royal Agricultural Hall, that the Automobile Club is to hold a Hill-Climbing and Consumption Trial

on May 2nd., i.e., next Thursday week. The special purpose of this trial is that vehicles of new types and other vehicles may have attached to them at the Royal Agricultural Hall Exhibition the Club's official certificate as to their hill-climbing powers and as to their consumption of fuel. The trial will be open to any vehicle, whether it is to be exhibited at the Royal Agricultural Hall or not, or whether it be the property of a business house or private individual.

Important regulation as to fuel tanks.—The Technical, Legislative, and Trials Rules Committee met on the 18th inst., but at the time of going to press its decisions had not been received. It is understood, however, that Lt.-Colonel H. C. L. Holden and Mr. Worby Beaumont, as the result of their experiences at the consumption trial of the 13th inst., intended to recommend to the Committee that a condition in connection with the trial of the 2nd May shall be, that no vehicle shall be admitted unless its fuel tank be fitted with a tap or other arrangement at the lowest point of the tank, by which the contents of the tank may be entirely drawn off. Such a device should undoubtedly be fitted to all liquid fuel tanks, in order to allow their being cleansed of impure fuel, grit, and other foreign substances; and for the purpose of an accurate measurement of fuel consumption a means of entirely emptying the fuel tanks is indispensable.

Suggestions as to Trial.—The route, etc., of the trial was also to be considered at the meeting, the agenda of which contained the following suggestions:—(1) That the ordinary 100-miles trial course of the A.C.G.B.I. should be followed at the trial of the 2nd May. (2) Mr. S. F. Edge's suggestion that the consumption of vehicles should be taken during a continuous hill-climb by means, for instance, of six ascents of Hinds Head, the descents being made by gravity. (3) That the consumption should be taken on three courses: (a) London to the foot of Dashwood Hill; (b) Six ascents of Dashwood Hill (4 miles), the time of each ascent to be taken, but no records in excess of twelve miles an hour to be published, the descents being by gravity; (c) Dashwood Hill to London; routes (a) and (b) to be made if possible without stopping. If this suggestion be adopted very valuable information as to the efficiency of the vehicles should be deduced. If the capacity of cylinders and speed of engine be known, it should, by means of this test of four miles up hill, be possible to arrive at some conclusions as to loss in transmission from engine to road wheels, and such a test might make the proposed laboratory horse-power test superfluous.

Last date for entry.—Particulars of the trial, as decided at the Committee meeting, may be obtained of the Secretary of the A.C.G.B.I., 4, Whitehall Court, London, S.W. The last day for entrance will be Tuesday, the 30th inst., at 12 o'clock noon.

RESULT OF FRENCH RACING UP-TO-DATE.

WE append a tabular synopsis taken from the *Vélo* of the results of some of the principal automobile races held in France during the present year.

	Date and Place.	No. of Entries.	No. of Starters.	No. Fin. shed.
Feb. 15, Pau (Tourist race)	40	19	15
March 5, Nice (Brunetta Cup)	6	6	2
" 25, " (Speed) (Nice-Salon-Nice)	39	24	14
" 25, " (Tourists) (Nice-Dragnignan-Nice)	40	22	20
March 28, Nice (one mile race)	15	15	15
" 28, " (H. de Rothschild's Cup)	11	11	11
" 29, " (Nice-La Turbie)	43	43	38
" 31, " (Nice Cup)	6	3	1

From these figures it will be seen that for the eight races there were 200 entries, of whom 133 ran and 111 finished the course.

FURIOUS DRIVING CASES.

As briefly mentioned in our last issue, Mr. R. B. Bird, of The Firs, Moseley, was summoned at Henley-in-Aden Petty Sessions for driving a motor-car furiously on the highway at Hockley Heath, on March 24th. Mr. T. W. Staplee Firth appeared for the defence. P.C. Blackburn said he was on duty on Sunday, March 24th, on the highway at Hockley Heath when he heard a motor-car coming from the direction of Birmingham at what appeared to him a great rate. Witness took out his watch and as the car appeared round the bend of the road at the Box Trees, the driver evidently saw witness and slackened speed, and as the car arrived at the end of the lane leading to Knowle Station he again noticed the time; 25 seconds had elapsed. The car was then about 120 yards from witness, he put up his hand and the driver stopped at once and gave his name. Witness stepped the distance, which was 360 paces between the two given points, and allowing thirty-two inches to the pace, would bring it to 320 yards, or twenty-six miles an hour. While he was talking to defendant, a horse and cart with three men came up. One man had to get out and lead his horse by, and as he passed he shouted to defendant, "You ought not to pass anyone like that, you ought to be had up for it." Cross-examined, witness said the defendant did not say he was driving under twelve miles, he said they were not going particularly fast. Witness admitted that no lives were in danger. Mr. Firth, in addressing the Bench, contended that the case for the complainant was ill-founded in law, the proceedings

having been taken under the old Highway Act for furious driving, and quoted several cases in support of his objection. The Bench retired to consider the case, and upon returning into court the chairman said it appeared that the summons had been issued under a wrong section, and would be dismissed, but a new summons would be issued under the right section, and for the convenience of the parties would be heard at once. Mr. Firth strongly objected to this, and contended that the bench had no power to adopt this course. A sharp "passage of arms" took place between Mr. Firth and the magistrates' clerk upon the authority for the procedure, Mr. Firth eventually consenting to remain with his client for the hearing of the second summons, stating that he did so under protest. P.C. Blackburn then repeated his evidence, after which Mr. Firth called the defendant, who said they were driving in the motor on the day named from Tudor Grange to Henley, and when near to Monkspath Bridge saw three men with a restive horse. Witness pulled up, while one of the men got out and held the horse, and he passed when one of the men signalled for him to do so. This was about 1½ miles from the place where they passed witness talking to a constable, and it would have been quite impossible for the men to have caught them up if they had been travelling at the pace alleged. Mr. Alfred Bird gave corroborative evidence. Mr. Firth

highway at the time the car passed. There were several people on the pavements. Mr. Firth submitted a point of law to the Bench. He was summoned, he said, for driving at a furious rate so as to endanger the lives and limbs of the public, but he pointed out there was no evidence in the case to prove this. In fact, the evidence was of a contrary character, for both the witnesses had sworn there was no one in the highway when the car passed. Therefore no persons' lives or limbs were endangered. The Bench retired to consider the point raised, and on their return the Mayor said that the point of law was sustained and the case would be dismissed. He, however, expressed the regret of the Bench that the case had not been taken under the Light Locomotive Act, which regulated the speed of motor-cars to twelve miles an hour.

LIABILITY OF MOTORISTS.

SHERIFF JOHNSTON has issued his decision reversing the judgment of Sheriff Substitute Lee in an action raised in Forfar Sheriff Court at the instance of Mrs. Ann Cathro Mitchell or Lumsden, Kirriemuir, in which pursuer sought to recover from Alexander Ross French, Forfar, the sum of £100 in respect of injuries said to have been sustained by pursuer and

A LOCOMOBILE ON THE ICE BRIDGE AT NIAGARA—NO OTHER VEHICLE HAS EVER BEEN ON THE BRIDGE.

addressed the Bench at considerable length, and after a short deliberation, the Chairman said there appeared to be a little doubt, and they would give the defendant the benefit and dismiss the case.

In our last issue we briefly reported the fact that Mr. T. W. Staplee Firth was summoned for driving a motor-car at a furious rate so as to endanger the lives and limbs of the public at Poole on March 31st. On this occasion Mr. Firth appeared in the dual capacity of defendant and advocate. Police-constable King said at 10.10 on the evening of March 31st he was standing near the Amity Hall, when he saw a motor-car approaching from the direction of the Quay. The car was being driven very fast, his opinion being that the rate of speed was fifteen to twenty miles an hour. He shouted to the defendant to slow down, but he took no notice of the warning. He received complaints from people respecting the rate at which the car was travelling. Witness was subjected to a searching cross-examination by Mr. Firth as to the mode in which he ascertained the rate at which the car was travelling, and admitted that at the time the car passed him there were no persons in the roadway and no vehicles about. A witness named John Rowland, who had been subpoenaed, said he was walking down the High Street about 10.10 on the night of March 31st, when a motor-car passed him going at a tremendous rate—he should think more than fifteen miles an hour. Police constable King called to the driver of the car to pull up, but he took no notice. The line of cross-examination of this witness was the same, and he also stated that there was no one in the

her infant child, through being knocked down by a motor-car driven by defender at Kirriemuir in July last. Sheriff Lee found that the accident was not caused by the fault of the defender. Sheriff Johnston takes an exactly opposite view, and finds that the injuries were caused by the negligence or want of skill of the defender. He fixes the damages at £30, and finds defender liable in expenses.

DRIVING WITHOUT LIGHTS.

At the Lincoln City Police Court, Horace Spurr was summoned for not having a light attached to a motor-car of which he was in charge in St. Botolph's, Lincoln, on the 10th inst. Defendant, in extenuation, said that he was driving in the rain, and did not see that the light was out. Fined 10s. and costs.

BEFORE the Arundel County Bench, on Monday, Douglas H. Whitehead pleaded not guilty to driving a motor-car at Littlehampton without a light on March 26th. P.C. Harwood deposed that the defendant was in charge of a motor-wagonette, which came along Terminus Road from the direction of High Street. There were two others in the car, one in front and the other behind. The passenger sitting in front was holding a small electric light in his hand. They had a lamp attached to the vehicle in front, and when witness overtook them outside the railway station this was alight. Defendant also remarked that it was all right at the top of Arundel Hill. The lamp on the vehicle was in the centre of the car. Superintendent Kennett pointed out that even this

was not complying with the regulations, because the bye-law stated that the light must be on the off side. Defendant: It was put in the centre by the makers. Sir Henry Fletcher: That does not matter. You have got to comply with the bye-laws, and they say it must be on the off side. Asked if there was any previous conviction against the defendant, Superintendent Kennett replied in the negative, but stated that he had received several complaints about his furious driving. The Chairman: I was going to say that I have received several complaints myself about the pace at which this motor-car is driven about the streets and round corners. I have also seen it myself, and if more care is not exercised there will be a dreadful accident some day. Defendant said his car could only go twelve miles an hour at the most, and he also asserted that there was a good deal of ill-feeling towards the car in Littlehampton, which probably accounted for these complaints. The Chairman: The people who have complained to me do not happen to live at Littlehampton. Besides, I have myself seen the car driven at a dangerous rate, especially round corners, and I warn you that if more care is not exercised there will be an accident some day. The Bench imposed a fine of 10s., including costs.

MOTOR-CAR ACCIDENT.

AT the New Mills County Court, on Monday, his Honour Judge Smyly, K.C., heard a case in which Thomas Wain, farmer, Grainfoot, Derwent, sued Wm. Gunstone and Sons, Limited, wholesale provision merchants, Sheffield, to recover £7 1s. 6d., damages for injuries to horse and trap through the negligent driving of defendants' servants, on May 30th last year. Mrs. Mary Thorpe, of Derwent Vale, also sued Messrs. Gunstone for £20, damages for personal injuries sustained on the same occasion. Plaintiff's case was that on the evening in question Mr. Wain was driving from Hope with Mrs. Thorpe and her two children. At Borough Lane Head they were run into by the defendant's motor-car coming from Bradwell. The trap was thrown over, and the occupants were thrown into the road and hurt. It was at first thought the children were killed. Mrs. Thorpe's left arm was seriously injured, and cut to the bone, and her right arm sprained, and Mr. Wain was hurt. In cross-examination the plaintiffs both declared that Wain was on his right side, and denied that he was going at the rate of six miles an hour. For the defence Herbert Hardy, driver of the car, Mr. A. Parkes, defendant's traveller, and Mrs. Parkes were called to prove that the car was going at the rate of three or four miles an hour, and that the driver slowed and blew his horn before the approach. After a lengthy hearing his Honour said he considered the plaintiffs had made out their case. He awarded Mrs. Thorpe ten guineas and her doctor's bill, and to Wain he awarded three guineas.

ACTION AGAINST THE DAIMLER MOTOR COMPANY.

COVENTRY County Court was occupied for several hours on Tuesday in hearing the case of the Daimler Motor Company, Ltd., v. Fitt, which was an action to recover £52 5s., cost of repairs to a Daimler motor belonging to defendant. Plaintiff company was represented by Mr. A. M. White, barrister, and the defendant by Mr. W. H. Stevenson. In the spring of 1900 the defendant, a cab proprietor, coal merchant, etc., of Charing Cross, St. Benedict's, Norwich, purchased a car from the company at the price of £340 cash. A short time afterwards he had some repairs done, but the subject of the present action related to what was done to the car in June of last year. He brought it over to Coventry and left it at the works, and as he got no tidings of it for several weeks he came over with his wife and fetched it back with some repairs done. Afterwards a bill was sent in as follows:—To overhauling and repairing car No. 1415, supplying and fitting: 1 radiator new pattern water tank, £15; 1 pair slings for ditto, 10s.; 1 set crank shaft brasses, £1 15s.; 1 counter shaft, 17s.; 1 governor gear pinion, 10s.; 2 exhaust valves, 11s. 4d.; 1 ignition tube, £2 10s.; 9 gallons of petrol at 1s. 6d, 13s 6d.; 1 governor hammer, 4s.; 1 cut-off cam, 7s. 6d.; 1 cylinder head, £3 5s.; studs, bolts, nuts, washers, 12s. 6d.; overhauling gear, repairing feed-pipe joints, overhauling steering gear, and overhauling motor, £28 14s. 2d.; total, £55s. 10s. By 1 cylinder head allowed, £3 5s.; net total, £52 5s. Defendant, on receiving the account, strongly resented the heaviness of the charge, and action was entered in the King's Bench and the case was remitted to Coventry for hearing. Defendant had paid £25 into court.

The witnesses for the Daimler Company were Percy Richardson, late sales manager; M. M. Wormall, W. Shephard, A. Bush and A. Morton, employees of plaintiffs. All were closely questioned as to the actual repairs done to the car, the materials used, and the time spent on it. Mr. Richardson said the sale of the car was effected through Mr. F. Morris, the company's agent at King's Lynn. Mr. Shephard, as prime cost clerk, informed the Court that after charging cost the company, in doing repairs, put on 50 per cent. for establishment charges and 50 per cent. for profit in addition. Defendant on being called gave his evidence with a good deal of animation and there was something like a scene between him and the examining counsel. He stated that Mr. Morris, from whom he bought, was plaintiffs' agent for the Eastern counties—an assertion for which Mr. White asked proof. But the objection to admission of the statement was disallowed by the learned judge, and a letter of Mr. Morris's was put in. He brought the car by rail to Coventry for repairs, and saw Mr. Richardson, Mr. Bush, and a works foreman. He showed them the defective head of the machine, and sundry other things were suggested

by Mr. Richardson. The car was promised in ten days' time, but it was not sent, and so he journeyed over, with his wife, from Norwich. On going to the office he was asked to take a seat and given a cigar, and in about half an hour the car was brought round to the front door. He looked at it, and alleged that with the exception of a new radiator and a few trifling repairs, nothing had been done to it. He went back by road with it. When in September he got a bill for £55 10s. (£10 was afterwards taken off) he was astonished at the amount. He asked for details. Defendant was taken through the details of the account, and stated that the charges made were very excessive. He offered £18 4s. 11d. in settlement, but ultimately, on legal advice, paid £25 into court. Examined, he said he thought he knew something about motor-cars. For the last three years he had spent a good deal of time in becoming acquainted with the mechanism of them. He was a furniture-remover, coal merchant, and hackney carriage master. Mr. White: Do you call yourself an expert in motor-cars?—An expert, as far as driving and repairs go. To help to get a living he let out this car. He had asked Mr. Morris's opinion of this bill of the company, but Mr. Morris was not in court to give evidence. Why didn't you get him here?—Because he is your agent, and it would not be fair to bring a friend who is getting his living out of the plaintiffs. Do you suggest he would not tell the truth?—He would, if he had come. Do you suggest that we should dismiss him for telling the truth?—I am sure you would. You do?—I am sure you would. My case is that what was done to the car was not worth half the amount charged. In fact, that we are swindling?—If you ask me, I shall say I never saw such a swindle in my life. Have you disputed bills before?—Yes, and this company took off £14 out of £25. The cross-examination continued to be of an animated character, and counsel asked the defendant "not to lecture him every time." Asked if he had certain persons present who were alleged to have seen certain parts of the car, defendant answered that he had not. He had come 180 miles, and he could not bring half Norwich with him. There were, he said, a great many things in the bill which were not put into the car. Then there was a fresh altercation, and Mr. White said: Why can't you answer the question? Can't you answer any question?

Mrs. Fitt was also a witness, corroborating her husband's evidence as to what took place when they went to Coventry for the car. Mr. Stevenson then addressed the Court, and in the course of his speech, the Judge (Judge Ingham) said he was prepared to reduce certain charges; but Mr. Stevenson said he must address his honour in further reduction of the charges, which he did. Mr. White said but a few words in reply, but they were warm in tone. The Daimler Company could not, he remarked, sit down under the allegations contained in the defendant's correspondence or his assertions in the witness-box. They were willing, however, not to insist on every charge made in its full detail, and would submit to his honour's judgment. The judge then gave a verdict for the plaintiffs for £40 and costs.

A RACE from Mannheim to Pforzheim and back is being organised by the Rhenish Automobile Club to be run off on May 12th next.

GREAT surprise was expressed in French motor circles that Levegh, the winner of the Paris-Toulouse race, did not compete in the Nice event. An interesting story, however, has since leaked out which explains the absence of "vainqueur de Paris-Toulouse." Just before the race Levegh was riding up the street of Le Notre on his new machine, when suddenly he put on all the brakes. This sudden opposition apparently upset the equanimity of the machine, which began to "buck" with remarkable vivacity. When Levegh discovered that his machine lacked sufficient "stopping" powers he decided not to compete in the Nice events.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, APRIL 27, 1901.

[No. 112.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE King's horses have undergone the same ordeal as the late Queen's horses experienced with regard to the motor-car. The animals were paraded in the Royal Mews at Windsor Castle under the supervision of Lieutenant Hickey, of His Majesty's stables, and Dr. Bruce Porter, a member of the Windsor Corporation and an enthusiastic motorist, drove his vehicle round them. The horses, without exception, took no notice whatever of the horseless car, and then Dr. Bruce, deciding to put them

to a further test, drove right into the centre of them. At first the car occasioned a little dismay, but soon the animals became quite accustomed to it and treated the automobile with contempt. The horses underwent further tests but throughout they maintained an undisturbed equanimity. The results of the tests were regarded as highly satisfactory. The example set by the director of the Royal Mews might well be followed throughout the country. Bus proprietors and jobmasters, by having a motor-car in their yards for a day or two, would not only quickly accustom their horses to its presence, but would do much to minimise the number of accidents which occur through the unmannered behaviour of horses at the sight of a motor-car.

The Manchester Automobile Club.

THE Manchester Automobile Club had its first club run of the season on Saturday last, the destination being Nantwich. On arriving at the Brine Baths Hotel, the ten cars which took part in the run were drawn up in a semi-circle in front of the hotel, and formed a fine array of the latest types of motor-vehicles. Twenty-four members of the Club and their friends sat down to dinner at 6 o'clock. The cars, with the exception of two belonging to members who were spending the week-end at Nantwich, started for home at a quarter to eight. The weather, with the exception of a little more dust than was pleasant, could not well have been improved.

Motor-Omnibuses for the Isle of Wight.

A SERVICE of motor-omnibuses is apparently about to be started at Ryde, Isle of Wight, for at the last meeting of the Ryde Town Council, the General Purposes Committee recommended that licences be granted to motor-omnibuses, and that it be left to the Committee to make all arrangements. Mr. Mears, in moving the adoption of the report, said that full inquiries had been made as to the licensing of motor-cars in other towns. The resolution was adopted.

A Motor-Bicycle Fault.

As a knock-about vehicle the motor-bicycle has a few special drawbacks. The ordinary light vehicle can be stowed away with little trouble, but when one comes to finding a secure resting-place for a heavy motor-bicycle the owner will sometimes regret that the affair has not three wheels. It is

dangerous to leave it by the kerb; it cannot readily be brought into shops or houses—especially those addicted to flights of steps; and when in the country it cannot be laid on the ground as the ordinary machine often is, perforce, when the roadside offers no point of support. The purchaser must be content to bear with these drawbacks; and indeed if he get a machine reliable in every other way he will gladly overlook them.

Electric Cars in France.

WRITING in an American contemporary, Mr. Hart O. Berg says: "The high place which the petroleum carriage has taken in the automobiling field of France now shows some outward signs of being contested by the more gentle and quite offenceless electric carriage. The petrol light car, however, is becoming more and more popular, and small vehicles to hold two or four persons and weighing from 900 to 1,200 pounds are and will continue to be in increasing demand." Mr. Berg considers that the "stable" of the Parisian motorist "of means" will contain at least an electric brougham, a victoria, and a small petrol voiturette.

A Sign of the Future.

THE motor-car parade at the recent Dublin Show is regarded in Irish Press circles as a most significant sign of the future. In our last issue we referred to the almost total conversion of the English Press, and now we find the words quite as applicable to the Press of the Sister Isle. Without exception, as far as we know, the recent parade has been commented upon in favourable terms. Ballsbridge show ground in which the parade was held was the sanctum of the pawing steed until the motor-vehicles paraded therein about a fortnight ago, and the innovation has been warmly appreciated. In Ireland the motor movement is making progress, and the appearance of automobiles is becoming more and more frequent, whilst this year's visit of motor tourists to the Emerald Isle is looked forward to on all sides.

The London Fire Brigade and Automobiles.

WE are glad to learn that a movement for the substitution of motor-fire engines in place of the present horse-drawn vehicles is under consideration at the headquarters of the Metropolitan Fire Brigade. A representative of the *Motor-Car Journal* had an interview the other day with Commander Wells and was informed that numerous schemes—English, American, and Continental—had been thoroughly tested, but nothing satisfactory had so far resulted. In order to become better acquainted with the working of motor-vehicles, the Chief of the Fire Brigade has lately purchased a Locomobile.

The Conversion of "Dagonet."

MR. GEORGE R. SIMS, the well-known "Dagonet," has become a convert to the motor-car and is quite enthusiastic in the *Referee* of last Sunday over his experience. It was the greatest ambition of Mr. Sims' life "to fly through the air with the birds," and it was gratified by a ride with Mr. Alfred Bird, of Birmingham, on the latter's Panhard car. The motor-

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

car he regards as much handier than the horse in traffic, and he comments on the almost instantaneous stopping powers of the car. The opposition of County Councils Mr. Sims treats in a very light vein, comparing it to the effect "the first three letters of County and Council had upon the railway train."

Mails by Motor-Car in Australia.

THE Postal Department of Queensland have been holding trials of motor-cars to test their utility in the collection of mails. The idea was to use the vehicles in the drought-stricken districts, but at present there is not much prospect of their being adopted. The trials, however, have been eminently satisfactory and it is needless to say that the Department will keep the results well in mind for future emergencies. At the same time trials have been held in New South Wales, where the result has also been satisfactory. Before taking further steps, however, it has been decided to await the arrival in the Colonies of two new motor-cars, which are said to have many advantages over the cars now in use.

The Paris-Berlin Race.

CONSIDERABLE interest is being shown by motor-car builders in France in the forthcoming race between Paris and Berlin, and it is not improbable that quite a number of new cars will take part in the event. We are this week able to give an illustration of the type of car which the Gladiator Company is building for the race. As will be seen, it is built

low, and, fitted as it is with engines of 14 effective h.p., it ought to be capable of attaining a high rate of speed. The Motor Power Company, Limited, inform us that three of these cars are being built for the coming race, and that as soon as it is finished they expect to get one of them over to London.

Electric Canal Haulage in Belgium.

ELECTRIC motors have been put to a new use in Belgium. Instead of the time-honoured method of towing barges on a canal by means of horses, small electric road carriages of 5 h.p. are now in use on the banks of the Charleroi canal. By this new method the products of the rich coal mines of the Charleroi district can be towed down to the port of Antwerp (a distance of fifty miles) at the rate of three miles per hour, as against one and a half miles per hour by the old method. The cost per mile of equal tonnage is the same in both cases. The electric current is taken from overhead conductors through three separate trolleys. These canal automobiles work over sections of varying length. One motor tows a boat until it meets another coming in an opposite direction. In a minute the tow lines are exchanged, and the motors retrace their routes without passing one another. The driver has two seats at his disposal—one for either direction, thus avoiding the necessity of turning the automobile.

Motor-Cars for Military Purposes.

IN the course of a paper on "The Cycle as an Aid to Military Operations in South Africa," read at a meeting of the Cycle Engineers' Institute last week, Lieut.-Col. R. E. Crompton said that the result of his work in South Africa was that Lord Roberts sent him home with others to the War Office for the purpose of helping forward the question of design of mechanical transport in all forms. He could say roughly that it was the intention of their Committee and the intention of the War Office to produce, in the first place, efficient traction trains, resembling the old traction trains, only better, which would be independent of fuel and water supply to a far greater extent than had ever yet been attempted—the use, for instance, of the internal combustion engine, and possibly those of the Diesel type. Besides using heavy engines for transport, lighter kinds of automobiles would be used wherever a wheeled carriage had ever gone. He was convinced from what he had seen that they could show with lighter haulage as great superiority as they had shown with heavy haulage. The introduction of motor traction into warfare would also prove a great factor in the lessening of sickness among the troops. The dreadful enteric, which killed three times as many men as were killed by the Boers, was entirely due to animal transport being used. Dead animals, which were present everywhere, polluted the water and the air. If they could supersede animal transport wherever possible, the impedimenta of war would not hang so heavily upon an army.

The Fair Maid of Perth.

THE following amusing story of a lady, a constable, and a motor-car was told in a recent issue of the *North British Daily Mail*:—"A motor-car was standing opposite a draper's shop door in High Street, Perth, when a lady came up to a constable, ordering him to have it removed, as it was frightening passing horses. In vain the constable explained his inability to cause the motor to 'move on'; the lady persisted that the constable should take it 'in charge.' Matters were looking serious for the constable, who was to be reported forthwith for failing to do his duty, when, fortunately, the owner of the motor emerged from the shop, mounted his seat, and drove off."

Motor-Cars at Epsom.

QUITE a large number of motor-cars turned up at the first Epsom race meeting of the century. The road to Epsom was as usual crowded with wagonettes and every conceivable form of horse vehicle, but here and there a motor-car darted out from among the long *queue* of vehicles and sped away—much to the disgust of the occupants of the other roadsters. On arrival difficulty was experienced by many in finding a resting place for the horseless car. Some of the stablemen refused to take care of them on the ground that the horses would be frightened, and in consequence the turf by the side of the road was dotted with motor-cars in charge of *mécaniciens*. It would be interesting to know what were the charges made by those who consented to take care of the motor-cars. A noteworthy fact was the very small number of horses which paid the slightest attention as a motor-car buzzed by.

Mechanics and First-Aid.

EVIDENTLY the Duchess of Portland remains to be converted to the delights of motoring. Speaking at Worksop recently in connection with the St. John Ambulance Association her ladyship said: "Should it ever be my misfortune to exchange the noble horse for the doubtful joy of a motor-car, I should unhesitatingly give preference to the driver who had passed the best tests of the St. John Ambulance Society and who could render first-aid as often as it would probably be necessary under the present conditions of automobilism." It would appear from these expressions that the Duchess of Portland has not yet experienced a ride on a motor-car, for even under the most un-

favourable circumstances, when the elements have to all appearances combined to frustrate the run, the novice has expressed great enthusiasm at his experience. With regard to the desirability of employing a certificated first-aid driver we quite agree, but we fail to see why it should be more or equally as imperative for a mechanic to possess those qualifications as for a coachman or driver of any other means of locomotion. In fact every day proves that motoring accidents are on the decrease, while accidents through other means of locomotion show no sign of decreasing.

Electric Vehicles v. Tramcars.

A VERY interesting article, headed "Electric Vehicles v. Tramcars," appears in the current issue of *Cassier's Magazine*. Mr. Alton D. Adams, the writer, deals with the subject in a convincing and straightforward manner. His reasoning is of a most lucid character, and every point which can possibly affect the argument is given due consideration. In summing up Mr. Adams states: "The cost of land, buildings, and generating plant is in most tramcar systems only from one-half to one-third of the investment in rails and electric circuits, and it has been shown that the cost of generating plant and of vehicle batteries combined is only about one and one-fourth times the investment for the generating plant alone in a tramcar system of equal passenger capacity. It seems certain also that the repairs on the batteries of a vehicle system can be made at an annual outlay of not more than that now necessary to repair electric lines, rails, and one-half of the generating plant. There remains, then, as an unbalanced advantage of transportation with battery vehicles, a saving of about one-half of the entire first cost, and also of one-half of the annual interest charges of present tramcar systems."

Control Contests at the Crystal Palace.

FORTY-SIX entries have been received for the Control Contests of the English Motor Club which are to take place in the grounds of the Crystal Palace this (Saturday) afternoon. Every known class of motor-vehicle, except electric, will be represented, the electric vehicles, for some reason or other, standing aloof. In addition to the Control Contests through the grounds, there is to be a speed trial on the Upper Terrace. A number of automobilists have signified their intention to drive down to the Palace, and, given a fine day, there should be a notable gathering. The first event is down for 2.30 p.m. Since the above was written, we learn that Messrs. Shippey Brothers have entered two electrical vehicles in Section K, so that there will, after all, be competitors in every class.

The Roads Improvement Association.

AT the annual meeting of the Roads Improvement Association, the Hon. Scott Montagu, M.P., and Messrs. Worby Beaumont and H. P. Boulnois were elected the representatives of the Automobile Club upon the Council. It was also decided to make a new departure in the work of the Society by initiating a considerable movement for the reform of the existing system of highway administration. It will be readily seen how a movement of this kind will fit in with, and assist, the efforts now being made by the Automobile Club to oppose the restrictions upon automobilism proposed by many highway authorities.

Automobile Regulations in Berlin.

THE Berlin Police have just published the new regulations for the use of motor-cars and similar vehicles in the public streets of the capital. All motor-vehicles are to be provided with easily-worked steering gear and trustworthy brakes, and all excessive noise and obnoxious smoke, steam, or smell is to be avoided. When a speed of fifteen kilometres an hour is used the vehicles must be so built that they can be stopped on asphalt within eight metres at most. The lantern, when lit, must fully illuminate the way at least twenty metres in advance.

Every motor must have a number stamped by the police, the name of the maker, and the weight and horse-power, on a clearly-visible plate. Motor-cars not owned by Berliners may be temporarily used in the capital, provided their drivers can show an official certificate from their own police. Similar certificates, issued by German officials, must be carried by foreign motor-car owners. The owner is responsible for his vehicle and for the driver, and must notify all changes concerning it, or his address, to the police. The driver must be over eighteen, and must have an official certificate from a public expert or from a driving school; and he is liable to temporary loss of his certificate in case of negligence. He is also responsible for the condition of the vehicle. The police can prohibit the use of certain streets. The speed at dusk and on municipal roads must not exceed fifteen kilometres an hour, and is to be relatively diminished in crowded, slippery, and curving streets, or when crossing narrow bridges, etc. Motor races are only permissible with the consent of the police. On leaving the car the driver must fasten up the machine and brake, to prevent improper use.

THE EASTER TOUR.—MOTORISTS AT SALISBURY.

The Latest American Craze.

THE latest craze among the motorists of Washington is to spin up and down the avenue leading from the Treasury to the Peace Monument in the cool of the evening. The avenue is described as a broad, level thoroughfare, a mile in length. After the heavy traffic of the day is over, the avenue is practically deserted, and the ardent motorists can speed their vehicles without much fear of being interfered with. The parade begins at ten o'clock, and up to midnight the number of motor-cars steadily increases. Not very long ago West End cyclists developed a craze for cycling in Hyde Park, turning out in their myriads. But this craze was short-lived, and cyclists found a greater pleasure in taking a run into the country, where level roads are interspersed with hills. This new "fad" of our American cousins will soon follow in the footsteps of the cyclist craze in London.

The Automobile Club's Whitsuntide Tours.

THE Tours Committee of the Automobile Club at their last meeting settled the preliminary programmes of the tours to be held at Whitsuntide. There will be two different tours this year, one having Oxford as its headquarters on the nights of Saturday, 25th, and Sunday, 26th May. The day's runs will be settled at Oxford; it is hoped that members of the Midland Automobile Club will join in this tour. The other tour is to Paris to witness the start of the Gordon-Bennett race. The start will take place at Boulogne on Whit Sunday morning.

Amiens being the day's destination. On Monday, May 27th, Paris (90 miles) will be reached. The return journey, *via* Rouen and Dieppe, will start on the morning of May 29th. Mr. Dick Farman, of the General Automobile Agency, has undertaken to make arrangements to convey members of the Club in good motor-vehicles by road from the sea-coast to Paris and back at a cost of about 25s. to 30s. per seat per day, or for the two journeys, say Boulogne to Paris (two days) and Paris to Dieppe (two days), from £5 to £6 per seat. It is thought that many members may not care to go to the expense and trouble of shipping their cars to France for such a short period, and that the above arrangement may therefore be acceptable to them.

A Tour to Liverpool.

At the invitation of the Liverpool Centre of the Club (the Liverpool Self-propelled Traffic Association) the members of the Automobile Club will tour to Liverpool in order to be present at a portion of the Trials of Heavy Vehicles now being organised by the Liverpool Centre. The Tour will start on Saturday, June 1st, members meeting at the Regent Hotel, Leamington, on the Saturday evening, having made their way there as they please. The journey will be continued *via* Coleshill, Lichfield, Rugeley, Stafford, Eccleshall, Nantwich, Tarporley, Chester, and Birkenhead. Mr. Shrapnell Smith has undertaken to make arrangements for the storage of motor-vehicles at Birkenhead, should there be no carriage-ferry on their arrival there.

Motor Vehicles for Cotton Transit.

The forthcoming trials of the Liverpool Self-propelled Traffic Association in June are arousing great interest in East Lancashire. The inefficiency of the local railway lines in coping with the distribution of raw material in anything like a satisfactory manner is seriously handicapping the output of the manufacturers. The Manchester Ship Canal and the smaller canals with which this district is intersected have done good work, but it is the slow means of transit which stand to their disadvantage. It is felt on all sides that the solution of the present difficulty lies in the adoption of motor-vehicles, and that at no very distant date, by the use of this simpler and more effective means of transit, the attendant disadvantages of railway and canal services will be overcome. The *Textile Manufacturer*, in dealing with the subject, says:—"The convenience of some regular system of transit of this kind will be invaluable. Motor-vehicles travelling from, say, Liverpool could serve the various Lancashire towns with raw cotton and other imported goods direct from the dock. In time roads would be improved, and this direct service would become both cheaper and more speedy than by railway, with its delays at junctions and termini and its unbending officialism."

Motor-Cars at Horse Shows.

A LETTER from Mr. Archibald Rosling, of Chelmsford, was submitted to the last meeting of the Committee of the Automobile Club, in which he suggested that a motor demonstration should take place in connection with the Essex Agricultural Society's Show to be held at Lexden Park on the 12th and 13th of June next. The Committee decided that the Club could not recommend demonstrations of motor-vehicles at shows at which horses are to be shown, as probably many of these would be untrained or newly trained.

WITH reference to the question of the width of tyres, the Automobile Club is arranging to give an inspector of the Local Government Board a practical demonstration of a motor car fitted with *solid rubber* tyres which are under the width prescribed by the regulations (the Locomotives on Highways Act, 1896) in relation to the weight of the motor car. The experiment is to be made under the least favourable conditions as to the state of macadamised roads.

THE AUTOMOBILE CLUB'S RUN TO DUNSTABLE.

THE members of the Automobile Club had a most enjoyable run on Saturday to Dunstable. Outside the Club at Whitehall a small muster of members assembled, including Mr. R. E. Phillips and Mr. Lyons Sampson, in the former's Mors Petit Duc, Mr. Phillips driving; the Hon. Leopold Canning and Mr. Heard, in the former's Century tandem, Mr. Canning driving; Mr. and Mrs. T. B. Browne and friend on a 6 h.p. Panhard, Mr. Browne driving; Mr. and Mrs. Peall and two gentlemen in a 6 h.p. Daimler, Mr. Peall driving; Mr. Johnson and Mr. Bruce in a Darracq car, the former driving; Mr. Bidlake on a Singer motor-bicycle, and Mr. and Mrs. O. Stanton and a representative of the *Motor-Car Journal* on a 12 h.p. Daimler. The Hon. C. S. Rolls and Mr. Harrington Moore, the latter in a Delahaye voiturette were at the Club to see the start.

Soon after 2.30 p.m. a start was made for the thirty-three miles run to Dunstable by Mr. Johnson, the other cars following in quick succession, Mr. Stanton's Daimler bringing up the rear. Some of the members journeyed via Edgware and Elstree, while a deviation was made by Mr. Peall and Mr. Stanton and latterly by Mr. Browne, the route followed in this case being via Regent's Park, Finchley, High Barnet, and St. Albans.

The weather was all that could be desired—a great contrast indeed to the previous Saturday's experience. The sun shone warmly, and without exception the heavy overcoat was discarded on the outward journey. The road was full of cyclists and others on pleasure bent. The former found it a wearisome task pedalling along in the warm sun and cast longing eyes at the motor-car as it dashed past, mounting the hills with remarkable ease and speeding quickly out of sight. The drowsy driver and the lazy carhorse were almost moved to exertion at the buzz of the fast disappearing vehicle. But there were many drivers who slumbered peacefully on utterly oblivious of the right side of the road and taxing the dexterity of the motorist to the utmost capacity. In fact, on many occasions to the eye of the uninitiated it was a wonder that the occupants of the 12 h.p. Daimler arrived safely at their destination. But here and there the road was practically free from any other vehicle, and a sharp run was enjoyed at a speed at least up to the legal limit. Up the hills and down into the dales, the 12 h.p. Daimler rushed along, occasionally stopping to direct Mr. Peall and party on the right road, but when Mr. Browne's car hove into sight in the rear, just discernible through the thick clouds of dust, Mr. Stanton decided to leave Mr. Peall to the care of the new arrival and make a bold dash for Dunstable. Just before 5 p.m. the 12 h.p. Daimler ran into the yard of the Sugar Loaf Hotel, soon after the arrival of Mr. Canning on his attractive Century tandem, which was the first to arrive. The other cars followed soon after. During the afternoon the party was joined by Mr. Kenealy, on his new 10 h.p. Delahaye, accompanied by Miss Annesley Kenealy and Mr. N. B. Kenealy, who ran over from Watford; Mr. Percy Richardson, on a Daimler, accompanied by Mrs. Richardson and Mr. Collinge Wells and son, who came over from Caddington Hall, Markyate, and Mr. Gretton and lady on a M.M.C. phaeton.

A dinner was afterwards held at the Sugar Loaf Hotel to the strains of the town band, at which the following ladies and gentleman were present: Mr. and Miss Kenealy, Mr. N. B. Kenealy, Hon. Leopold Canning, Mr. Bruce, Mr. Phillips, Mr. Lyons Sampson, Mr. Heard, Mr. Johnson, and Mr. and Mrs. Stanton.

The return journey was started soon after eight o'clock, London being safely reached in good time.

As a motor lorry, belonging to the Elland Flour Company, was descending Luck Lane, Huddersfield, it dashed through a wall on the side of the road, and dropped in a broken condition into a field on the other side. The driver and his attendant, however, escaped without serious injury. So far the cause of the accident remains unexplained, but it is stated that the driver was compelled to do this to avoid running into some children playing in the road.

MR. MARK MAYHEW'S VISIT TO NICE.

IN the last issue of the *Automobile Club Notes*, Mr. Mark Mayhew, L.C.C., gives an interesting account of his recent visit to Nice, from which we take the following:—

My motor visit to the shores of the Mediterranean has been the most enjoyable holiday I have ever experienced. For a keen motor man nothing could be more exciting or satisfying than to live there in the early spring 'midst an atmosphere redolent of petrol, conversation saturated with petrol, and men living on petrol. One meets there everyone famous in the automobile world. Starting on Wednesday, March 6th, on my 16 h.p. Napier, with my friend Mr. Arthur Russell, my mechanic and baggage on board, I drove to Southampton, crossed to Havre, and then on to Paris on Thursday. The next day we started for Bordeaux, travelling by way of Orleans, Tours, Poitiers, arriving at Bordeaux on Sunday. Leaving Bordeaux on Tuesday, 12th March, we travelled by Carcassonne, Montpellier, Marseilles, to Nice, where we arrived on Friday.

Our journey had been absolutely without incident, excepting two punctures. With fine but cold weather, the most magnificent roads in the world (excepting the last part of the journey), and the car always travelling very well, we had the most enjoyable run I have ever experienced. There was never the slightest trouble with the engine or any part of the car beyond a slight sinking of the back springs.

But it is of what I saw at Nice I wish more particularly to write. We found collected in the garage of the Automobile Club of Nice probably the best and most powerful of all the cars that existed in the different parts of Europe, they having made Nice their rendez-

vous for the race week. The most noticeable point, perhaps, from an Englishman's view was not so much the engine-power of the cars as their remarkable lightness. Taking, for instance, the most successful machines in the races, the "Mercédès" or new type of Cannstatt Daimler, we found an engine of about 35 or 40 h.p., a long car with very comfortable accommodation, which in racing rig weighs slightly over one ton and for tourist purposes about 22 cwt. Five of these started in the *vitesse* and tourist races over very difficult, dangerous, mountainous rough roads—and came back without mishap.

It is said that the English Daimler Company has the right to the drawings and particulars of all cars made by the Cannstatt firm. If this be so, and if the new board of the English Daimler Company is awake, it is to be hoped that they will instruct their engineers to turn out a complete copy of the "Mercédès," and thus take advantage of the brains and money which have been expended on these cars. The latest manufactured type of Panhard is 20 h.p. nominal, said to develop about 30 h.p. on the brake. These cars weigh under a ton in racing *carrosserie*, and are supplied with change of speed and direction all on one lever, startlingly small gear, and a few improvements in the usual

type of engine. Their speed was considerable, but not so great as the "Mercédès," owing to the smaller engine. There were one or two big Mors carriages of not less than 45 h.p., which were probably really the fastest cars there. The failure of Mors and Panhard in the races was undoubtedly due very largely to a number of little mishaps, such as slipping clutches, troublesome pumps, etc., which might easily have been avoided by more care on the part of the makers in turning them out, and by their owners by trying them thoroughly before the start. Rochet-Schneider have brought out an extremely well made 24 h.p. car which does them great credit and looks as if it would last.

So much for the big cars. Now let me notice the voituresses. The most noticeable is the 12 h.p. racing Darracq, a mere skeleton with a huge engine, very noisy but extremely fast. It would have astonished some of our *chauffeurs* to have seen these little monsters tear up the steep sides of La Turbie. Then there were the little Peugeotts, both racing and tourist, with four wheels of the same size, bicycle pattern, and electric ignition. But the engine is still in the rear as in the old types. The big racing Renault did not show up. Among the promenade voituresses nothing could be prettier or more satisfactory than the

little 6 h.p. Darracq with its elegant bonnet, and the 10 h.p. Mors with perfectly charming carriage work.

The racing tricycles can only be described as terrible. Ridden with open exhaust boxes at fearful speeds by men who have the courage and certainly the appearance of fiends, these machines are hardly likely to attract the English buyer.

There were numerous other patterns which it is hardly necessary or interesting to mention. But I could not see all of these magnificent automobiles without drawing some important conclusions and making a few remarks upon some of their peculiarities. Their great feature is unquestionably their lightness,

THE NICE MEETING—WERNER ON THE 35 H.P. "MERCEDES" CAR.
[Cliche de] [Allgemeine Automobil Zeitung.]

This in itself does away with the need for so much strength, as the cars bob over lumps and bad places such as *caniveaux* in the road like a cork instead of dashing against or crashing into them, as is inevitably the case with a heavy car. The result of this is that in springs and tires there is an enormous saving. In order to illustrate here what is being done in France and also to get further experience myself, I bought a 20 h.p. Panhard just out of the works which had been sent to Nice, and drove it home. The tires would surprise any one who examined them, being practically without cuts, the tread being worn to a nice fine sand-paper surface all the way round after a journey of 1,000 miles. Another point which is being made much of by the Continental manufacturers is the power of the foot-brake. This can be relied upon to stop the car under almost any circumstances, so that one may go at pretty well full speed down a winding mountain road and pull up easily for turning the bends. To compare the fitting, however, of the foreign cars with that of the English would be, in my opinion, decidedly in favour of those produced by our manufacturers. Much more care appears to be taken before the English car leaves the shops. It is also necessary to point out

that the racing cars I have spoken of are not expected to go through more than two or three long races. A big overhaul would be necessary after each long race, and future purchasers know, or at least find out afterwards, that they require a great deal of attention.

I have great hopes that an English car will do well in the Gordon-Bennett race of 1902; but as regards 1901 I fear we are on the wrong track in building heavy cars. But still the fact remains that they produce a faster machine than we have been able at present, and I think this is largely because of its lightness, and, for my part, I would rather spend a few pounds in putting in new gear once every five or six months than perhaps £100 in the same time in burst or worn out tires.

The following rough comparative table between the travelling powers of my 16 h.p. Napier and the 20 h.p. Panhard may be interesting (brake horse-power—Panhard 30; Napier 23½):—

Uphill and upward inclines—the Panhard much faster.
Downhill and downward inclines—Napier rather faster.
Perfectly smooth level ground—almost identical speed.
Uneven to rough level—Panhard 5 miles an hour faster.

I happen to know that the Panhard car to be run in the Gordon-Bennett race will weigh about 1,250 kilos (cwt. 24.55), and its engine will develop 55 h.p. on the brake. The motors will weigh about 1,300 kilos (cwt. 25.53) and the engine will produce about 65 h.p. on the brake. Both weights are given without water and petrol.

In conclusion, I can only advise English automobilists who wish to enjoy themselves and at the same time learn for certain more than they ever dreamt of before about automobiles, to drive their cars to Nice next spring for the race week, and see for themselves one of those things which appears to be "done better abroad."

THE BELL ODOMETER.

THE accompanying illustration shows the new odometer which has recently been put on the market by the S. H. Davis Mfg. Co., of Portland, Mass. This instrument takes the same place on vehicles that the cyclometer does on bicycles. It fastens to the axle, and is operated by a steel pin in the hub of one of the wheels. The dial contains three

indexes of different colours. The red index measures a mile with every revolution, the dial dividing the mile into forty spaces of eight rods each. At the end of each mile a small bell inside the odometer rings. The yellow index revolves once in forty miles, and each space represents a mile, and the blue index revolves once in 1,600 miles, so that each space represents forty miles. The instruments are made for all wheels from 28 to 54 inches in diameter, varying by half inches.

THE demonstration of motor-cars before the members of the Gloucestershire County Council will take place this afternoon (Saturday). The following members of the Council have expressed their intention to take drives on this occasion:—Mr. J. S. Gibbons, Mr. E. H. Parsonage, Mr. Edward Playne, Mr. A. E. Dykins, Mr. J. R. Lane.

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE numbering of motor-cars is the panacea for all the ills of traffic. Such, at least, is the view of certain County Councillors; it is not mine, nor that of any man who has first-hand knowledge of the conditions of road usage, in town or country alike. It happens that I have seen a good deal of the life of our highways in nearly every English county, and in many parts of Scotland, Ireland, and Wales; but during all the tens of thousands of miles that I have travelled by road within the British Isles, I cannot recall one single instance where the mere fact of carrying a number would have been of the slightest benefit to anyone concerned. But the average County Councillor thinks otherwise—"and Brutus is an honourable man."

Was it not from Surrey that this idea of scintillating luminosity first emanated? Did not the sapient fathers of that county, indeed, e'en summon "experience" to their aid when they declared, in a portentous letter to the *Times*, that it had been found that the Light Locomotives Act was far from adequate to control the automobilist, albeit the said Act, forsooth, *had not come into operation* at the time this letter saw the light? There were yet nine days to pass before "Emancipation Day" arrived, from which it is clear that Surrey had seen a modern miracle. We speak sometimes of "positive experience" the Surrey fathers boasted of experience by anticipation, the precise value of which is mathematically expressed as minus nine.

BUT Surrey has done more; let us not fail to enumerate her achievements, for it is very evident that she is proud of them. Twelve months ago the trees, the walls, and the bar-parlours of the county were bedecked with certain notices, none too grammatically expressed, in which all cyclists and automobilists were admonished as to reckless driving, and from these exclusive proclamations an awe-struck public would infer that the users of motor-cars and cycles were the sovereign malefactors of the day. No word was said by Captain Sant, who signed these manifestoes, as to the furious driving of horse-drawn traps, their almost universal non-observance of the rule of the road, their oft-recurrent evasion of the bye-laws as to lights. It was the owners of man or motor-driven vehicles alone that were put in this constabulary pillory; the horse and all its satellites were "sacrosanct."

WELL, cyclists can take care of themselves in this matter; they skim over Surrey roads in scores of thousands, and yet scarcely an accident is recorded from year's end to year's end. But what of the automobilist? How much longer is he disposed to tolerate the exposure of these needless and offensive placards, which are still exposed throughout the county, and one of which even stares him in the face when he removes the stains of travel in the Automobile Club itself? Whereas automobilists are the most skilled and careful of all road-users, and drive the most perfectly-controlled of all vehicles, they are virtually held up to obloquy by the Chief Constable of the County, and the immediate effect upon the mind of every horse-driver who reads these superfluous and insulting warnings is to invest him with self-righteous satisfaction, and the ever-present, if fallacious, idea that motor-cars do but exist on sufferance. As a consequence he assumes, whenever he comes across a motor-car, that he himself is free of all responsibility, and that the onus rests solely with the driver of the car to turn aside, or even come to a dead stop, and that, if the horse should happen to be frightened, the bare idea of its owner being at fault is beyond the pale of possibility. And probably, if he reads the reports of County Council deliberations, he will echo the sentiment with which I have opened these *obiter dicta*, and declare that "the numbering of motor-cars is the panacea for all the ills of traffic."

BUT is it? What bearing has the numbering of motor-cars upon nine-tenths of the rampant illegalities of the road, to which

the Chief Constable of Surrey habitually turns a blind eye? As was mentioned in this journal last week, the Lord Justice Clerk counted no less than fifty-three unattended horses in the course of thirty miles: will Captain Sant explain why he sanctions this wholesale violation of the Highways Act? And will he further explain how the numbering of the car on which Lord Kingsburgh was riding would have prevented any of those three and fifty animals from shying had they felt so inclined? Meanwhile, it is surely reasonable to expect that the police will be instructed to carry out the law in future where horse-drivers are concerned, not only in this matter of unattended and even untethered animals, but also as regards the rule of the road and the evasion of the lights bye-laws.

It is to the stultifying antipathy to any faster means of locomotion than that of the horse that we owe the gestation of "numbering" resolutions, or absurd warnings like the one with which Surrey is placarded. It is a singular fact, nevertheless, that high speed has never yet been shown to be a direct or even indirect cause of any automobile accident in this country, nor of the frightening of horses, for animals which have not been properly trained, and show fear in the presence of motor-cars, will do so irrespective of their speed. Though I have ridden on many cars, I have never found any type more liable than another to disturb equine equanimity, or a fast car more dangerous to travel on, *per se*, than one that could not go at half the speed. It is the individual driver who is the important factor in the situation, and, indeed, I would prefer to go at fifty miles an hour with Mr. Rolls, Mr. Montagu, or Mr. Edge than at five an hour with a novice on his first Benz.

A FEW weeks ago I found myself on a 16 h.p. car, which, up to that time, was the fastest on which I had ever ridden. Knowing, as I did, that it is the driver, not the power of the motor, that one has to consider, I did not entertain the most infinitesimal alarm as to possible mishaps; but I did make up my mind before the start to note the circumstances of any occurrence by the way, with the special object of determining whether pure speed had any bearing on the issue, and whether, under like conditions, a slower car would have brought about an opposite result. For my own part, I stood in no need of conversion on the subject, but I put myself for the nonce in the position of a disinterested observer, in order that I might speak with added emphasis did matters eventuate as I surmised.

LET me describe what happened. The car picked me up at Surbiton, and barely had we left the outskirts of the parish than incident number one occurred. Two hundred yards ahead, on the straight road to Hook, we saw a slow cart in the middle of the road. The driver proved to be a boy, who seemed, and was, quite incapable of directing the animal between the shafts. As we drew nearer, the horse began slowly to turn round; we slackened speed, and finally stopped altogether, whereupon the noble beast incontinently backed the cart into the car, and did nine guineas' worth of damage. I hunted up the owner of this intelligent quadruped, and brought him to the spot. Stretching right away for several hundred yards back, and clearly visible by reason of the wet surface and the slightly downward slope, were the broad marks of our 120 millimetre tires, closely parallel with the kerb as far as the eye could see. In the face of this damning evidence the owner of the cart, a local publican, could say little in defence, after some preliminary bluster and splenetic comments on the car itself; he has since paid the claim for nine guineas. As this was a "motor-car accident" one ought to have read into it, as a matter of course, the culpability of the automobilists concerned, the value of Captain Sant's "warning," and the super-sublimated wisdom of the County Council doctrine as to the numbering of cars. I cannot say, however, that the incident impressed me in this light, though I have premised that I started out in an impartial frame of mind.

SOMEWHAT ruffled by this interruption we set off for Leatherhead, after patching up the damage, and travelled serenely for

the next few miles. [While ascending the 1 in 11 hill out of the town, however, we met an empty hearse on the wrong side of the road. As we drew close we further observed that the driver was fast asleep! Nothing that is wrong ever happens on the road except in the case of motor-cars, and no doubt it may be urged that the driver in question was but exercising his rights; but if this proposition be too broad even for a restrictive County Councillor or Captain Sant, perhaps they will kindly explain how the "numbering" resolutions of the one or the "warning" of the other would have applied to the circumstances of the case. We had to stop still on the hill until we had awakened the somnolent driver of the hearse with our horn, whereupon he lazily crossed to his proper side. But for ourselves he might have driven into something, or overturned the hearse at the awkward corner just below.]

BEFORE we got to Guildford we had encountered several unattended horses, and were nearly collided with by a trap driven very wide at a corner, which we ourselves had approached with extreme care, not merely from ordinary caution but also because of the greasy condition of the road. I have not the smallest doubt in my own mind but that the driver of the trap was quite prepared to support a "numbering" resolution, and equally to applaud the Chief Constable's "warning"; but the relevancy of either was no more apparent than before. Later still, as we were returning from Guildford by the Portsmouth route, we met a carriage and pair in the middle of the road. The car was not going at all fast, but the coachman was so frightened that he pulled over to the wrong side, and forced us outwards. At the foot of Pain's Hill we found a string of six carts outside a public-house, with not a single person in charge of any of the horses. This is a spot which has long been sacred to the persecution of cyclists; it must be left to the local police to state why the law was not enforced against the drivers of these animals also. It is quite on the cards, however, that they do not even know the provisions of the Highways Act in this respect, their superiors being more busily engaged in enunciating the virtues of their pet panacea, namely the carrying of a number by every car, and also in posting up superfluous "warnings" against the most conspicuously safe vehicles on the road.

THE STRATTON MOTOR-BICYCLE.

THE Stratton Motor-Bicycle Company, of Wall Street, New York, have lately introduced the motor-bicycle shown in the accompanying illustration. The motor, of 1½ h.p., is mounted over the lower tube of the frame, and drives by a belt to a large pulley on the rear wheel. The battery and spark coil, together with oil tank, which holds enough petrol for about fifty miles' travel, are contained in a triangular case. The motor is

started by several turns of the pedals, which, by a free wheel clutch, are then thrown out of engagement. The switch of the sparking apparatus is in one of the handles. The speed of the engine ranges from 1,500 to 2,000 revolutions per minute. The silencer, which is of the company's own design, is placed just in front of the bottom bracket, and is claimed to almost entirely eliminate the noise of the exhaust.

THE EFFECTS OF VIBRATION.

THE injurious effects of vibration on the strength of metals have been familiar to engineers for a long time, and their importance in connection with locomotive work has led to a perhaps somewhat exaggerated view regarding them to be taken in automobile matters; for it is at least doubtful whether, with modern tires, road vibration plays any large part in inducing crystallisation and fracture in the components of a car; it is more probable that when such occurs occasional excessive stresses, especially if alternate ones, are the principal cause. Vibration, however, from one source or another—and the small high speed engines so popular now are an obvious one—is apt to injuriously affect the lighter horizontal members of the mechanism, such as brake-rods, etc., and the presence of loose joints in these greatly aggravates the evil. Signs of looseness in such parts should be carefully attended to and remedied, and even a leather washer or, in default of anything else a loop of string packed into the loose joint is better than nothing, while such care will be repaid by a silent-running car, quite 75 per cent. of the usual noise of a car being generally attributable to such easily rectified causes. To facilitate this all joints should be fitted with removable bushes, preferably of phosphor bronze, where there is no other means of taking up wear; if this is not done, the process of putting in a bush or a larger pin is sometimes interfered with by there being hardly sufficient metal left to safely take it. Where a horizontal rod, as that of a brake, is required to act in tension only, it might be advantageously replaced by a thin and somewhat flexible bar of flat section, while the fitting of an adjusting link, with screw-thread, in the middle of a round bar of this kind is a direct encouragement to breakage; if adjustment is necessary it should be near one end. In one or two cases the writer has replaced a 3-8 in. brake-link of some length, that gave repeated trouble by fracture, with an eight-gauge steel wire, with satisfactory results; in one a $\frac{1}{2}$ in. bar had been first substituted, which soon broke.

For the same reason a pair of light tension rods should be preferable for the connection of the steering wheels to the usual solid bar intended to act both under tension and compression; and the same principle would apply throughout the whole design.

Such unpleasant effects, however, as fractures are fortunately comparatively rare; and the usual way in which vibration demonstrates itself is in the loosening of nuts, bolts, and so on, while the means adopted for preventing this are not always satisfactory, seldom soaring beyond the time-honoured pair of lock-nuts with or without a split pin above them. The lock-nuts, if well fitted, do their work, and though requiring to be awkwardly bulky if they are to be easily adjusted, are on the whole the best where adjustment is needful; the only function of the split pin being to prevent the nuts being lost, as a loose nut will take no very long time to shear a split pin through. If, therefore, the latter is used with a single nut it should be of ample dimensions and a tight fit. In places such as bearing caps and piston rod big ends, it sometimes happens that a particular nut gives repeated trouble. This may be caused by a want of alignment in the bearings; otherwise it will generally be found

that the lock-nuts or the bolt they are on have not got a true thread, so that their faces do not bed firmly against each other. In some cases the insertion of a thin leather or fibre washer under a nut will prevent its easily shaking loose; while in the instance of an adjustable bearing cap, a piece of wood or fibre packing under the ears of the cap, of such a thickness that when the cap is bolted down in adjustment the packing is slightly compressed, will often cure a tendency to looseness. More elaborate devices than lock-nuts are in use on some foreign cars, the simplest being a miniature spanner embracing the nut, the handle of which is attached to the part against which the nut bears by a small screw; another much resembling the clamping-piece of the familiar Bown bearing and needing a toothed edge on the nut, both of which are very good if the small screw does not loosen. Another ingenious one consists in having a pentagon head above the screw on the bolt, on which a plate is retained by a split pin, having a pair of ears embracing two of the hexagon sides of the nut, the five positions of the plate on the pentagon with its six positions on the hexagon giving the power of fixing at every thirteenth of a revolution of the nut.

The writer recently was driving a car which developed an alarming noise in the crank chamber, and on investigation found that four countersunk screws holding the crank counterpoise were merely secured by a large centre-punch mark in the metal

opposite the slot of the screw, and one of these, not unnaturally, had protested by making a journey of exploration on its own account, to its serious detriment. It is to be regretted that in little matters of this sort our own makers are frequently less careful than Continental ones. The safest method, after all, of securing a nut or screw is the somewhat crude one of riveting; and it is worth noting that if the end of the bolt or stud be hollowed out somewhat into a cup-shape, this may be done with less violence, and less trouble will attend its removal if needful; but of course

it is only admissible where adjustment is not required.

The "helical" nuts, which are composed of a left-hand spiral of solid steel, shaped outwardly and inwardly to the semblance of a nut, seem to be very satisfactory, and are claimed to be self-locking; but how far they may be depended on for this under automobile conditions is not quite clear as yet. Finally—and this is a point which British rather than foreign makers need to lay to heart—in automobile design the ability to resist vibration, as to some extent the ability to resist strains, is to be sought in elasticity rather than rigidity, and in lightness rather than weight; and the limits of possibility in these directions are only to be found by practical experiment, even at the cost of some unpleasantness to users when they are exceeded.

R. W. BUTTEMER.

WRITING in the *Times of India* on the desirability of the Bombay Municipality substituting motor-cars for the present fire-brigade cars drawn by horses, a correspondent says: "I think they would be both more economical and less dangerous. The present primitive mode of using horses as a traction power is both unreliable and unsafe. The animals get restive or shy and are fast and furious at the wrong moment, and, instead of becoming useful, prove a source of risk to the life and limb of the pedestrian."

FIG. 1.—GENERAL VIEW OF THE TOURAND SPIDER. (See opposite page.)

THE TOURAND MOTOR-CAR.

IN our issue of the 16th March, 1900, we published a brief description of the petroleum-spirit motor-car built by Messrs. Tourand and Co., of Havre, France. We are now able to give some additional particulars and drawings of the vehicle, which appears to comprise several special features. The motor is located in the fore part of the frame under a bonnet; it is of the Crozet type, the feature being the employment of two vertical balanced cylinders, with only one inlet and one exhaust valve. It is capable of developing $6\frac{1}{2}$ h.p., and is fitted with electrical

FIG. 2.—SIDE VIEW OF MOTOR.

ignition and water-jacketed cylinders. A general view and sectional elevation of the motor are given in Figs. 2 and 4. The valve chamber is located centrally at the top between the two cylinders AA', K and H being respectively the inlet and exhaust valves, L being the sparking plug. The exhaust-valve control gear is driven off the shaft B', and is enclosed in a small case projecting from the crank case. Each crank shaft is provided with a flywheel

FIG. 3.—VIEW OF MOTOR, SHOWING GOVERNOR.

and also counterweight, DD', the two shafts being connected together by the flywheels CC', the flywheel of one of the shafts being made to act as one half of the driving clutch. The carburettor employed is of the spraying type. The petrol flows by a pipe into a chamber. A movable rod carrying at its end an inverted

"mushroom" with conical end, closes the tube. At each suction stroke of the motor warm air is drawn in by a pipe; the mushroom is at the same time automatically raised, allowing a charge of petrol to flow. The spirit is projected against the sides of the mushroom, and intimately mixed with the air. A butterfly nut is provided at the top of the device by means of which the amount of "lift" allowed to the rod, and consequently the amount of petrol inspired for one charge, can be regulated. An additional air inlet is contrived on the pipe con-

FIG. 4.—SECTION OF MOTOR.

veying the carburetted air to the explosion chamber. The motor is provided with a centrifugal governor mounted on one of the crank shafts and acting on the exhaust valve. A pedal-operated "accelerator" is also provided by means of which the speed of the engine can be regulated between 300 and 900 revolutions per

FIG. 5.—SECTION OF VARIABLE-SPEED GEAR.

minute. The water circulation is maintained by a small pump driven by a belt off the main crank shaft. A radiating coil is provided in the fore part of the frame.

Coming now to the transmission mechanism, four speeds forward and reverse motion are available, all controlled by one lever working on a sector. As already stated, the flywheel of the main shaft forms a part of a friction clutch,

by means of which the motor can be cut out from the transmission gear at will. The extension of the motor shaft terminates in a bevel gear meshing with a corresponding wheel on a cross shaft. This carries, enclosed in an oil-containing case, a variable speed gear of the Montauban-Marchandier type, of which a section is given in Fig. 5. From the differential counter-shaft the power is conveyed to the rear road wheels by the usual sprocket wheels and chains.

The frame of the car is built up of steel angles, while the steering is controlled by an inclined hand-wheel. Both hand and foot brakes are provided, while the road wheels are of wood shod with Michelin pneumatic tires. Special attention has been paid to lubrication; the petrol and water tanks have a capacity sufficient for a run of 100 kilometres. The car complete weighs about 14 cwt. The motor and gear being carried on an independent frame any type of carriage body can be fitted. Fig. 1 shows a three-seated spider, but Messrs. Tourand are also building two-seated cars, *tonneaux*, etc.

THE PERFECTA WATER-COOLED MOTOR-QUADRICYCLE.

IN addition to their well-known light car Messrs. Darracq and Co., of Suresnes (Seine), have lately introduced a new quadricycle with water-cooled motor, of which an illustration is given herewith. It is fitted with a Perfecta water-cooled engine developing from 3 to 4½ h.p., while a more powerful type for professional riders is built with an engine giving off from 5 to 6½ h.p. The circular tank shown at the rear of the saddle is divided into two halves, the top half containing the cooling water, and the bottom half the petrol and lubricating oil in separate

compartments. The connection of the water-circulating system is clearly shown in the illustration. Leaving the bottom of the upper tank by four exits, the water flows through the cooling radiating tubes on either side of the vehicle, and from thence by the two pipes shown to the water inlet at the bottom of the cylinder jacket. From the top of the combustion chamber it flows by the pipe shown to the top of the top tank. The carburettor is of the Longuemare type. The framework of the machine is well designed, while the front seat is supported on laminated steel springs.

THE General Automobile Agency of 100, Long Acre, W.C., have just received from Paris a 6 h.p. Darracq light car fitted with a four-seated phaeton body. The rear seats are separate and hinged, turning up from the centre to admit of entrance from the rear.

WE regret to learn of the death of Mr. J. P. Sweeney, of the Grappler Tire Company, Ltd. He was carried away with terrible suddenness. He got an attack of brain paralysis, and only withstood it for two days. At the motor-car parade at Ball's Bridge, Dublin, on the 11th inst., he drove the Grappler Tire Company's Mors car, and seemed to be in his usual health, and yet within six days he was dead.

JOTTINGS BY A WORLDLING.

As many English automobilists will be taking their cars over for the Gordon Bennett Cup, it will doubtless be of interest to readers of the *Motor-Car Journal* to know the cheapest and best way of having them carried from London to a French port. I have studied the question very thoroughly, and I have come to the conclusion that the Bennet line from London Bridge to Boulogne is by far the most satisfactory. The charges are from 30s. to 40s. according to weight, and one's servant can travel with the car in a sufficiently comfortable berth for the small charge of 10s. The best hotel in Boulogne is the Imperial; it has a good *garage*. Bayly's Hôtel de Folkestone is very comfortable and the cooking at the Paris is excellent. I hear that Hill, of 86, rue Thiers, has a good repair shop and does his work well. The road to Paris is good but hilly, starting with a veritable mountain and run down into Pont-de-Briques. Those who break the journey at Amiens will find the Hôtel de l'Univers very comfortable, and Devanaux, of 13, Boulevard Alsace-Lorraine, a good *mécanicien*. When I am in Paris with a car I always stay at the Continental, because there is a covered yard behind in which I leave it at night without paying anything but a 5 francs tip to the *concierge*.

I HAD a curious experience the other day in driving through the New Forest at night. It was very dark and I could only see a little way in front of me; indeed, only so far as my Dietz lamps threw their yellow light. I was going very slowly when I suddenly saw a large dark object in front of me that seemed to be moving. I drove up to it very cautiously to find that it was a forest pony standing broadside on in an attitude of complete indifference to my vigorous "hooting." I had at last to get down and persuade him with some violence to give me room to pass. *Apropos de bottes*, the roads in the Forest are very good.

THIS occurred on my way to Bournemouth, a most enlightened town, where there are dozens of automobiles. There are a large number of Daimler public service cars, and nearly every medical has a De Dion voiturette. I saw a Mors *petit duc* and a Benz, which I was informed had never been driven on top speed by its owner, a rather nervous man. I heard a Bollée several times, and I was once nearly run over by a Star.

MR. HALES, the brilliant war correspondent of the *Daily News*, told me the other day, as we were walking through Richmond Park, that powerful cars carrying a maxim and eight or ten men would be of incalculable value in South Africa. "But what about roads?" I objected. "Roads?" was his answer; "you don't want roads. Why the veldt is nowhere so rough as this park." I wonder if the War Office knows this?

DE DION voiturettes are very popular with members of the Stock Exchange. Mr. Edgar Pullbrook, a jobber in the Kaffir market, has just bought one of the new 4½ h.p. Cudells, but this is not his first experience of the joys of automobilism, as I saw him on a quad over a year ago. And I hear that he went for a tour at Christmas on a friend's 3½ h.p. car.

No self-respecting country house should be without an automobile for station work. You have no right to send a good pair of horses to catch cold waiting for trains, when for £300 or £400 you can buy a car that will do the work more satisfactorily. On the other hand, I do not believe that we shall ever live to see horses ousted from the Park. They are much too decorative for Woman, to whom, after all, the Park belongs, ever to be unfaithful to. I for one rather resent the presence of our dear *Ten-fenfs* between Hyde Park Corner and Kensington Gardens. I should, indeed, be glad if they were not allowed there, as in the Avenue des Acacias. This is not *lese automobile* but mere worldliness based on the principle of the music-hall song, "Oh, I want to be popular, popular, popular!"

CONTINENTAL NOTES.

BY "AUTOMAN."

THE Charity Fête organised by the Belgian Automobile Club took place in the Hall du Centenaire, at Brussels, on Sunday, the 14th inst., and was in every way a brilliant success. Financially speaking—and before every other consideration in a charity fête, the question of the financial result must take precedence—it was a surprise, bringing as it did to the Society for the Protection of Children about £600. There were nearly 150 entries for the several competitions, and some five to six thousand spectators occupied the various seats. In the Royal Box I noticed Monseigneur the Count of Flanders, their Royal Highnesses the Prince and Princess Albert of Belgium, the Prince and Princess Fritz of Hohenzollern, and the Duke and Duchess of Vendôme. Prince Victor Napoleon sat beside the jury, and in the boxes close by were the Ministers of Finance and of Industry, and many members of the foreign embassies. There were altogether eight competitions, of which the most interesting were certainly the combined movements commanded by Captain Soucy, of the second regiment of the Guides, at whose word of command the cars turned to the right and to the left, and made all kinds of complicated manœuvres without the least accident of any kind. After the competitions were concluded there was a battle of flowers, for which the competing carriages re-entered the arena in order to bombard the spectators with fragrant ammunition in the shape of lilies, ranunculus, anemones, and violets.

THE Swiss Automobile Club held its first competition on the 14th inst., in the shape of a race for voiturettes weighing less than 10 cwt., and having not more than 7 h.p. The distance covered was sixty-one miles, partly in French and partly in Swiss territory, beginning at Port-Noir and ending at the Parc des Sports at Charmilles. The winner was Mr. George Richard, of Paris, his time being 3 hours 57 minutes. The weather could not have been worse, and militated seriously against speed.

AUTOMOBILISTS cannot be too careful in passing bicycles on the road. We are all a little apt to rely too much on the powers of quickly swerving on the part of the cyclist, and this is often itself a cause of additional danger. Two fatal accidents in the Bois de Boulogne, Paris, which occurred on Friday week last, prompt me to give a word of warning to drivers of fast cars. In the first case Girardot's *mécanicien* was passing the little tramway station of the Jardin d'Acclimatation, at the gates of the Bois, and a cyclist was pedalling slowly in front of him on his own side of the road, but hearing a sudden blast of the warning motor-car horn, he seems to have lost his presence of mind, and swerved outwards instead of towards the footpath. The motor-car had not time to pull up, and the unfortunate cyclist was killed. In the second case two cyclists were on their wrong side, and met a motor-car in the road round the racecourse at Longchamps. The motorist was on his right side, and kept to it until he was close on to the cyclists; the latter, instead of crossing on to their own side of the road, tried to hug the footpath. One succeeded, but in swerving to avoid him the automobilist struck the other full and killed him outright. Evidently the fault in both cases was with the cyclists, but I have often noticed that a great number of cyclists are given to these errors of judgment, and it is therefore necessary for motorists to take this seriously into account when nearing a bicycle on the road.

THE King of the Belgians has certainly taken to motor-cars in serious earnest. When he arrived in Paris last week he was met at the Lyons Railway Station by two motor-cars, the one a splendid *coupé* of 16 h.p. driven by Charron, and bearing the Royal arms, and in which the King and the Princess Clementine were driven to the Elysée Palace Hotel, and the other a 20 h.p., in which the King's suite took their seats. In the afternoon the

King and his daughter could be seen again motoring in the Bois de Boulogne.

FOLLOWING the lead of his Royal uncle, Prince Albert of Belgium has just ordered a motor-car. He has, however, been more patriotic than the King, and his choice has fallen on a car of the Gobron-Brillié system, manufactured in Belgium by Messrs. Nagaut, of Liège.

THE Paris-Berlin race, which is fixed for June 27th, 28th, and 29th, will be run in the following laps: First day, from the Fort of Champigny to Aix-la-Chapelle, 284½ miles, *via* Reims and Sedan; the second day, from Aix-la-Chapelle to Hanover, 276 miles, *via* Cologne and Düsseldorf; the third day, from Hanover to Berlin, 182 miles, *via* Magdebourg; total, 743 miles. There are already quite a number of makers bringing out new models of high-powered cars for this event. Amongst others M. Deschamps showed me a few days ago a new four-cylindered 12 h.p. car which he is preparing at his works in Brussels. He expects this car to be very light and yet robust, and though he does not pretend that he will be able to do the maximum speed of the Mercedes, he thinks that he has a chance of averaging a high rate of speed.

THE Italian 1,000-mile tour, which I mentioned to the readers of the *Journal* last week, is going to be quite an important event. Twenty-six cars are already entered, and the start will be made from Turin on April 27th at 7 a.m. German, French, and Italian cars are to compete, but I do not see any English makes represented. The tour will visit Genoa, Spezzia, Florence, Civita Vecchia, Rome, Perouse, Bologna, Padoue (from whence an excursion will be made to Venice by steamer), Brescia, ending up at Milan, where an exhibition will be held on May 12th. The total distance covered will be 1,018 miles, and the longest run in one day will be from Sienna to Civita Vecchia, 129 miles.

MICHELIN, in his "Monday" in the *Auto-Vélo*, this week treats of motor wheels with bicycle spokes, and warns users to be very careful that the heads of the spokes are flush with the inside of the rim, and do not project in the least degree. It is also necessary to see that the heads are covered by a canvas braid, fitted in the hollow of the rim. When tightening or loosening a spoke great care is necessary, and should the head project it should be levelled down with a file.

THE SPEEDWELL PORTABLE LIFTING JACK.

THE Speedwell Motor and Cycle Company, of Broad-street, Reading, have lately introduced the useful portable lifting jack shown in the accompanying illustration. A light and compact lifting jack has long been wanted to carry on cars, for use in tire troubles and wheel detaching, cleaning, etc. The Speedwell device is made of strong aluminium alloy, and, while weighing only three pounds, is capable of lifting any voiturette. It occupies very little space, and lifts from ten to fifteen inches; is automatically held at each lift, and when released falls to the original position. For heavy cars and workshop use the company are making the same model in malleable iron.

CORRESPONDENCE.

THE ASTER AND DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Though I hardly consider it worth replying to, Mr. Jarrott's letter under the above heading, published in your issue of the 13th, would not be the worse for a few remarks passed upon it. I am amused at Mr. Jarrott stating that my judgment must be warped in preferring, after experience, the Aster to the De Dion engine. I ask which of the two is likely to be guilty of partiality, a private gentleman entirely disinterested with the trade, or Mr. Jarrott, the representative of De Dion-Bouton in this country?

I shall not waste time nor trespass on your valuable space by entering into a discussion which under the circumstances would be absurd. However, it would be well for Mr. Jarrott to take a ride on a car fitted with an Aster engine, and when he has spoken with as many members of the trade in France as I have done, he will be obliged to think differently of the Aster.

Mr. Jarrott copies my letter of March 30th to a certain extent, substituting De Dion for Aster wherever I praised the Aster. As to the number of revolutions of the De Dion motor, which Mr. Jarrott says ranges from 200 to 3,000, I reserve my opinion in this matter, in order to avoid flat contradiction. The Aster people have made this a great study, to arrive at the best possible result, and their motors have an immense range, working with perfect regularity at below 200 revolutions a minute and at a greater number of revolutions than any other motor-car on the market, with the exception of perhaps the Buchet.

Mr. Jarrott brings to the fore the subject of his racing. There have been no races in England. Anybody can run round a track, and for a performance on a track I have absolute contempt. A good long-distance road race with plenty of stiff hill-work and sharp corners in succession to negotiate when going fast downhill is what brings out the good points of a machine and what exposes the bad. It also enables the riders to exert all their skill.

Besides the many times on which the Aster has beaten the De Dion, allow me to point out the last important race of the year, Nice-Salon-Nice, where three De Dions, 8 h.p., were unable to beat one solitary Aster 8 h.p. The latter came in a good first, in spite of the fact that the rider broke his saddle on the way back, and the brave fellow pluckily sat on the top tube of his machine the rest of the way.—Yours faithfully,

LEOPOLD CANNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been rather interested in the correspondence in the *Motor-Car Journal* comparing the Aster and the De Dion engines. I cannot agree with quite all that Mr. Canning says regarding the De Dion. The contact-breaker possibly does require rather more attention than that on the Aster, but I think Mr. Canning somewhat exaggerates its disadvantages. I, personally, think with Mr. Jarrott that the adjustment of the De Dion trembler is simplicity itself—anyone can do it. There is one advantage which I do not think has been touched on, which is that the De Dion engine always seems to me to run with greater regularity and steadiness at a very low rate of speed. This is, I think, due to the fact that the contact on the De Dion is vibratory, and at a low speed the trembler has plenty of time to vibrate on the contact-screw, giving a stream of sparks at the plug however slowly the engine may be running. On the Aster, the contact-breaker giving a simple make-and-break, the motor is more liable to miss-fire at slow speeds, the circuit not being made and broken with sufficient rapidity. However, possibly I may be mistaken and the miss-firing be due to other causes, but this is how it has always appeared to me.

The adjustment of the Aster contact-breaker is undoubtedly not quite so simple as the De Dion. Once adjusted properly, however, it certainly does stay so longer than the De Dion. For instance, on one occasion I had to adjust the contact-breaker of an Aster three or four times in a couple of miles, before I was quite satisfied I had got it perfect. On a De Dion I have always

found I could get the adjustment perfect at once without having two or three "shots" at the job.

Regarding noise, I think it is a case of "six to one and half-a-dozen of the other." I do not believe the Aster is any more silent than the De Dion—if anything, it is the other way about. For all this I do not for a moment wish to imply that the Aster is not a good motor. It is a splendid engine and runs the De Dion very close, but I lean towards the latter. Both have good points, but the De Dion is at all events my favourite.

In comparing the two motors one other point is of interest, that is the method of cooling. Some time ago, Mr. Crowden, of Leamington, made, in a paper which he read—why I do not know—the most absurd remarks about air-cooled motors. He also said it was a piece of very bad practice to clip or thread radiating ribs on the cylinders for cooling, as heat would not pass through two bodies as through a solid one. Well, we have in the De Dion and Aster motors the two systems compared; and what do we find? In the former, the ribs are cast with the cylinder barrel, being of the same metal and forming part of it; in the latter, a copper shell carrying the ribs is placed round the barrel proper, but does not form part of it, being quite a different piece of metal, and not only that, but is a different kind of metal. According to Mr. Crowden's dictum this should overheat more than the De Dion, but in practice the Aster is not in the least more prone to it than the De Dion. The ribs, too, on the cylinder head are smaller in area than the De Dion, but yet there is no overheating. The machine I base my experiences on is a 3 h.p. Phebus-Aster, the cylinder being, I believe, 75 mm. bore by 88 mm. stroke; gear, 5 by 1. With this high gear the motor had to be forced very hard up hills, a large gas supply being necessary, and yet I have never had trouble. In riding from Croydon to Chatham and back, for instance, one has to mount about a dozen very steep hills—in fact, this is by far the hilliest road I have ever ridden on, but the Aster never overheated in the least, though I rode in the hot summer weather of last year. This proves the system of separate metal for the ribs to be quite efficient.

The Aster surface carburettor was good, and the motor seemed to work with greater regularity when it was used, than the De Dion pattern of surface carburettor admitted; I mean to say over bumpy roads, of course. The Aster carburettor, by the way, was an almost exact copy of the early Daimler surface carburettor, only in the latter the air had to actually go under the surface of the spirit, and rise up saturated with vapour, while in the former the air only passed over the top of the petrol.

My ideal of a motor-trike is practically the latest De Dion, with water-cooled head, clutch spray carburettor, etc. I have not yet ridden one, but should very much like to, as the running must be perfect. Unfortunately I do not know where to go for one, as there are not many on the roads as yet. When I do get an opportunity of trying one, I shall certainly take it.—Your faithfully,

E. H. LIVESAY, JUN.

MOTOR-CARS FOR LIGHT RAILWAYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. F. J. Maxwell's letter in your issue of April 13th, in reference to the want of a motor-vehicle to run on three feet gauge lines in Ireland, if Mr. Maxwell will send us his exact requirements we shall be very pleased indeed to quote for these vehicles, and, if serious business is meant, will go into the matter most seriously and carefully.—Yours truly,

For the Motor Power Company, Limited,
S. F. EDGE.

TIRE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I use the medium of your valuable paper to offer a suggestion for the benefit of users of Grappler tires? For the last six months I have used an Eadie trike fitted with Grappler pneumatic tires, and although the outer covers are perfect, never having been punctured, I have had considerable trouble with bursts in the inner tubes from internal causes. These occurred

as longitudinal bursts, about a quarter of an inch long, in the portion of the inner tube next to the bed of the rim. I found that all the spokes were firm and there were no projecting spoke heads, and further the bed of the rim was carefully protected by a tape. I carefully examined the inner tube and found that it showed marks along its surface indicating that at intervals it became distended as little pouches or balloons into the bed of the rim at places where the thick edges of the cover failed to meet. To strengthen these unsupported portions of the inner tube I obtained a strip of canvas the length of the tube and about two inches wide and solutioned it to the whole circumference of the tube next to the bed of the rim. I have had no trouble since. I wrote to the Grappler firm suggesting to them the advisability of fixing a flap to one edge of the cover to bridge over any gap that may form between the edges of the cover. Perhaps my suggestion may be useful to Mr. Egerton, who wrote about "tire troubles" in your issue of December 1st, 1900.—Yours truly,

R. D. R. ALLISON, M.D.

SOLID OR PNEUMATIC TIRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent, Mr. St. L. Finney, I have pleasure in referring him to the Kingston Motor Company, High Street, Kingston-on-Thames, who have a tire such as he requires. The great advantage of the tire is that if it should puncture, which is very unlikely, the tire can be ridden deflated. Mr. Guy Lewin is having his miniature Panhard fitted with them. Hoping that this information may be of service.

Yours faithfully,

H. J. LAMB.

STEAM OR PETROLEUM SPIRIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see your correspondent "Fair Play," writing anent the contests at the Crystal Palace, says he possesses a Locomobile and a 4 h.p. De Dion voiturette. I am thinking of purchasing one or the other, and I should like to hear his own experience comparing the one with the other. This would also, I venture to think, be of interest to many beside myself, who are "keen," but have to look at £150 before they spend it on a luxury.—Yours faithfully,

A MOTORIST IN EMBRYO.

MOTOR-STABLING CHARGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. Albert Hood, in his letter on the above subject, does not go so fully into detail as one might desire in causing such a statement to be published. The facts of the case are the following:—He came to the Swan Hotel, Alresford, about 8 p.m. on Good Friday, and if he had gone next morning, as he stated in his letter he did, he would have been charged 3s. 6d. He did not, however, leave until nearly 4 p.m. the next day, and considering that the proprietor moved two of his carriages out of the "lock up" coach-house so as to give him the whole use of it for repairs, etc., the charge cannot be regarded as exorbitant. As the letter of Mr. Albert Hood is likely to impart a mistaken impression, I trust you will be kind enough to publish mine.—Yours truly,

THOS. HANKIN.

[We consider the charge of 3s. 6d. altogether too high for stabling a car for one night, and we would avoid a place making such a charge. Two shillings for a car and eighteen pence for a voiturette is quite sufficient, in our opinion. The Portsmouth road is a popular road, and our correspondent would find, we think, it more profitable to charge the amounts we mention.—ED. M.-C.J.]

SPARKING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your experienced readers suggest the cause of the following defect to the working of an Aster motor? The trouble is that the firing becomes very intermittent when much power is put on, either when on the level or when ascending hills. The following parts have been all carefully examined, and are in good order and correct:—Contact spring and screw,

valves and their springs, sparking plugs with their points not too far apart, battery fully charged, and no short circuit apparent. The defect has not appeared before, and so cannot be due to overheating, as it comes on before the motor has got excessively hot. The trouble has only developed since a new bronze wheel has been put in.—Yours truly,

"ASTER."

ELECTRICAL DRAWBACKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motorists, I fear, have too readily plumped in favour of electric ignition for due consideration to have been given to other modes. The result is that in the great majority of mishaps the ignition is the source of trouble. Generally speaking, electricity is quite a mystery to the novice motorist, and from the way the installation is placed on many cars there is reason to suspect that not a few motor builders are almost equally ignorant on this subject. Mystery and uncertainty beset the novice on every hand. Firstly, he gets a box of mysteries called a battery. He has a dim notion that a certain amount of electricity can be obtained from it, provided there have been no leaks, etc. He finds it very difficult to determine at any time how much energy remains in the cells, for even if he has volt and ampere meters he seldom understands what information they really convey. A great tangle of wires has next to be observed. The system leads to switches, terminals; the coil—which is utterly mysterious to him; to the sparking plug; and finally to that monstrous tormentor, the contact breaker. Was ever such a plaguey conspiracy set against man's peace of mind!

The spirit of the contact breaker is one of utter devilry. There is encouragement for oil to creep on the trembler, and in muddy weather damp or grit. The apparatus, indeed, finds itself in just the position to be well splashed by the road wheels. And what a little drop of oil or mud or water will cause the engine to be poorly sparked! And what a lot of encouragement is given to the coquettish spark to wander off on short circuits! The wonder is that it ever works properly. Delicate adjustment of the working parts, proper attention to the battery or accumulator and sparking plug, and occasional inspection of wires and terminals are the best ways to secure efficient electric service. And to obtain this a man must know his subject a little.

The acquirement of such knowledge will entail some time and trouble, and till it has been secured the motorist runs constant risk of being stranded on the roadside. Herein is the first cost of electricity. Another, and one more easily measured—for it is reckoned in hard cash—is the charge for battery renewal. Isolated, it looks monstrous. A battery is reckoned to cost from 1-10d. to 1d. per mile. Usually the expenditure is nearer to the latter figure than the former, especially when dry batteries are used instead of accumulators. Now, it can be taken that the cost of petrol per mile is under 1d. for a voiturette. So that the upkeep of the ignition device costs about half as much as the motive power driving the engine! The relative proportion of the two costs seems out of all reason; and certainly it looks as if the advantages of electricity (even were it absolutely reliable) are bought at a very high figure. There is a great field for economy; and time alone will tell whether it will be effected by dynamos, or by the introduction of some improved form of tube ignition.—Yours truly,

A TROUBLED MOTORIST.

MR. R. DENNIS, of Messrs. Dennis Brothers, writes:—"With reference to the paragraph in your issue of the 13th inst. re the Brighton motor race at Preston Park on Easter Monday, I wish to make a correction. Although the machine I rode—a Speed King tricycle, fitted with 2½ h.p. engine, spray carburettor, and friction clutch—had 1,000 yards start from the higher power motors, I actually gained about half a lap on the scratch machine, and won by two and a-half laps, not half a lap, as stated."

THE new Board of Directors of the Daimler Motor Company, Limited, consists of Sir Edward Jenkinson, Mr. T. Bailey, M.P., Captain Longridge, Mr. J. H. Mace, and Mr. J. S. Critchley.

HERE AND THERE.

THE first appearance of a motor-car in Tuam the other day occasioned great excitement among the "natives."

WE are asked to state that the sole agents for the Werner motor-bicycle in this country are the Motor Manufacturing Company, Ltd.

WE understand that the Premier Cycle Company, Limited, of Coventry, who have been experimenting with motor-cars for some time, have decided not to proceed with their construction.

MR. W. K. VANDERBILT, jun., the well-known American *chauffeur*, has been elected a life member of the French Automobile Club.

AT a meeting of the Southwick Urban Council mention was made of the excessive speed at which motor-cars were alleged to pass through the town. It was resolved to communicate with the police with a view to "securing the safety of the public."

MR. H. Austin, of the Wolseley Company, will read a paper on "The Transmission Gear of a Motor-Carriage," at a meeting of the Cycle Engineers' Institute, to be held on Thursday, 9th May (during the Automobile Club Show), at the Agricultural Hall.

THE Douglas Clock Company, Hanley Street, Birmingham, a well-known firm of carriage clock manufacturers, are now devoting special attention in this direction to the requirements of motor-cars. There is no doubt that a time-piece placed in a suitable position on a well-appointed car is of great convenience to a driver whose hands are not always at liberty to dive into a watch pocket.

LAST Monday the staid life of the City was rudely disturbed by the tooting of a horn and a motor-car, owned by the proprietors of the *Sun* and bedecked with two small yellow flags, winding its way through the traffic. In the afternoon, however, the career of the gay car received a check. As it was bowling merrily along through Hyde Park, a police inspector espied the outrageous flags and requested the occupants to quit the park and proceed by the ordinary roads.

As Mr. Milton Nicholls, of Harrogate, and a friend were driving in a Daimler motor-car down the declivity known as Birdlip Hill, in Gloucestershire, on Wednesday, the vehicle got beyond control, and rushing onwards at a terrific pace, ultimately overturned. Mr. Nicholls was badly hurt, but his friend escaped with severe bruises, and the driver got off scot-free. The car was smashed. The hill is doubly marked as dangerous by the C.T.C. boards, and has been the scene of many cycle accidents.

KING VICTOR EMMANUEL III. has succumbed to the charms of motoring, and before long he will be the possessor of a car. For some time His Majesty stood trembling on the brink, but meeting Prince Strozzi of Florence in his motor-car as he was about to return to Rome after a week's shooting at his favourite hunting-lodge of Castelporziano, he decided to take a short run. Before long, however, he found himself winding his way through the narrow streets of the capital unrecognised by anyone, and when he arrived in the court-yard of the Palace the appearance of the King on a motor-car occasioned great surprise. The King was quite delighted with his experience, and the Italian motor-car manufacturers are jubilant over the conversion of His Majesty.

MR. HARVEY DU CROS, Chairman of the Dunlop Pneumatic Tyre Company, has informed Mr. Roger W. Wallace, K.C., that he and his company are extremely anxious to do all they can to secure that members of the Automobile Club racing in the Gordon-Bennett race shall be supplied with thoroughly efficient tyres. In Mr. Du Cros's opinion, however, the Dunlop Company were not given sufficient notice of these tyres being required, and he considers it against the best business interests of the company that they should consent to provide tyres under these circumstances. In view, however, of the importance of the event he is willing to sink the interests of the company in favour of the sport. Mr. Du Cros also stated that he was using every effort to place satisfactory tyres for heavy vehicles on the market.

THE Automobile Club is taking steps to compile a list of all persons in the United Kingdom who own motor vehicles.

MESSRS. PETO AND RADFORD, LTD., of 57B, Hatton Garden, London E.C., have issued a new price list of their accumulators for motor-cars.

THE Irish Automobile Club held its first run for the season on Saturday last, seven motor-cars starting from the Shelbourne Hotel, Dublin, for Bray.

THE annual motor-cycle races held under the auspices of the Automobile Club will take place at the Crystal Palace on 17th July from 5 p.m. to 8 p.m.

AT the last meeting of the Watch Committee of the Newcastle Corporation, applications were made and granted to run five motor-cars in the city.

MR. E. SHRAPNELL SMITH, the hon. secretary of the Liverpool Self-Propelled Traffic Association, has recently acquired an Ariel motor quadricycle fitted with the two speed gear.

MR. J. BAKEWELL WARRILOW, of Factory Lane, Chippenham, Wilts, is catering for the wants of motorists by keeping a stock of petrol, lubricating oil, etc. He is also able to carry out any necessary repairs.

MESSRS. HOARE AND SONS, American tailors, of Central House, 251-4, High Holborn, W.C., have sent us an ingenious calendar. Among their specialities we notice "Aquatista" overcoat, which is both waterproof and watertight.

MOTORISTS in the Sheffield district will be glad to learn that Messrs. Haigh and Company, of the Central Electrical Works, West Street, Sheffield, are now keeping a stock of petrol. They are also well equipped to undertake motor repairs, charging of accumulators, etc.

MAJOR-GENERAL MONTGOMERY has informed the secretary of the Automobile Club that he has arranged that petrol may be obtained on Sundays at Winchester by motorists calling at Mr. F. V. Rumsey's private address, 41, Tower-street, about two minutes' walk from the George Hotel.

A MOTOR-CAR is now being used to convey the mails from Woking Post Office to Chobham and West End. So far the experiment has given entire satisfaction. The motor-car, which is a "Star," belonging to Mr. J. Colman, of the Broadway, Woking, makes two trips each day, covering a distance of twenty-five miles.

WE announced some time ago that the International Motor Car Co., Limited, had decided to remove into larger premises. The removal has now taken place, the company being now installed at 76, High Street, Marylebone Road, W. (near Baker Street Station). The new show rooms are of large size and comprise a special repair and storage department, as well as one devoted entirely to second-hand cars of various makes. An extensive accessory department is also being organised.

THE Right Hon. the Earl of Shrewsbury and Talbot drove from Ingestre Hall to London a few days ago on his new 12 h.p. Panhard and Levassor car, which he purchased from the British Automobile Commercial Syndicate, Limited. The car was fitted with a set of the new Talbot tires, in which his lordship is interested, and which the above-named concern will put upon the market in this country. His lordship covered the distance at an average speed of twenty-five miles per hour, and it therefore speaks well for the tires that they so successfully accomplished their work, they being practically without a scratch.

AT the South-Western Police Court, last week, Tom Brantford, jobmaster, of Balham, was summoned for assaulting G. H. Bryant, driver of one of the motor-buses belonging to the South-Western Motor Car Company, which ply across Wandsworth Common. The complainant said he was driving his bus along Trinity-road on the 9th inst., when the defendant met him in a trap. The defendant deliberately drove over towards him, and he had to stop the bus to prevent a collision. Defendant got as near as he could, and then struck him across the face with his whip, immediately galloping away laughing. Unfortunately there was no witness to corroborate the complainant's evidence, and the magistrate dismissed the summons.

SPECIAL HILL-CLIMBING AND CONSUMPTION TRIALS

As mentioned in our last issue, an important trial is to be held by the Automobile Club on Thursday next, May 2, principally with the object of giving makers and agents an opportunity of subjecting their vehicles to official trial before they are exhibited at the Agricultural Hall, and in order that the vehicles may have attached to them at the Exhibition official certificates of their performances.

The vehicles entered for the trial will have an opportunity of endeavouring to make two non-stop runs of about thirty miles each, in connection with which the consumption of fuel will be measured, and also of proving their hill-climbing efficiency, and the consumption of fuel during a hill-ascent amounting to four miles in all.

PROGRAMME.

8.30 a.m.—Arrive at Norland Mews, Princes Road, Holland Park Avenue. Fuel tanks to be completely emptied. Fuel to be measured into tanks by official observers under the supervision of members of the Technical Committee.

9.0 a.m.—Vehicle to be weighed at Shepherd's Bush Railway Goods Yard—(a) With full complement of passengers; (b) Without passengers.

9.15 a.m.—Start for a Non-Stop run of 31 miles, viz.: by Ealing, Southall, Uxbridge, Beaconsfield, High Wycombe, to the thirty-third mile-stone at the foot of Dashwood Hill.

12 o'clock.—On arrival at thirty-third mile-stone, contents of fuel tanks to be drained into measures by official observers under supervision of members of the Technical Committee. The consumption over a run of 31 miles will thus be ascertained.

12.30 p.m.—Fuel to be measured into tanks by official observers.

12.45 p.m.—Ascend steep portion of Dashwood Hill [a measured distance of 1,173 yards]. Time to be taken by official observer on the car. At the top, engine may be stopped. The descent to be made by gravity; the car to be turned at the bottom, engine to be restarted, and the ascent to be repeated. When the ascent and descent have been made six times, fuel to be drained from fuel tanks into measures. The consumption over a run uphill of 4 miles, representing a total ascent of 1,300 feet, will thus be ascertained, and the average speed will be arrived at by taking a mean of the time-records of the six ascents.

3 p.m.—Fuel to be measured into fuel tanks by the official observer, and start for Non-Stop run to Norland Mews, 31 miles.

5.45 p.m.—On arrival at Norland Mews fuel to be drained from tanks into measures. The consumption over a run of 31 miles will thus be ascertained, and a mean will be taken between the consumption on the outward run and consumption on the homeward run in order to arrive at consumption over an average road. The consumption of a vehicle will not be measured if it arrives at Dashwood Hill on the outward journey later than four hours after its departure from Shepherd's Bush, or on the return journey at Norland Mews later than four hours after its departure from Dashwood Hill.

Fuel tanks.—No vehicle will be admitted to the Trial unless its fuel tank be fitted with a tap or other arrangement at the lowest point of the tank by which the contents of the tank may be entirely drawn off in reasonable time.

Passengers.—A seat must be placed at the disposal of the Committee for the carrying of an observer on each vehicle. Vehicles having no seat in addition to that of the driver will, therefore, not be eligible for this competition. Drivers of vehicles must see that all seats in their vehicles, except that reserved for the observer, are occupied by passengers having an average weight of not less than 10½ stone each.

Stoppages, duration and cause.—Stoppages, if any, and the causes and duration thereof, will be duly noted by the observers, and will be published in the result of the trial.

Passing.—The passing of one competing vehicle by another whilst both are descending gradients or within towns or villages is prohibited, and the vehicle of any driver who may break this regulation may be disqualified. The usual regulation as regards speed in towns, villages, etc., will be in force.

Speed.—In order to prevent excess in speeds, vehicles will not be permitted to pass certain points before the expiration of a certain period from the time of starting plus the total time occupied by stops, from all causes, since the start. If a vehicle arrive before time at one of these points and has to wait for the expiration of the period, the stop will be counted an involuntary stop, and will thus be recorded on the certificate. Detours to avoid arriving before time at a point will be accounted as stops. No speed in excess of the legal limit will be recorded or recognised. If on examination of observers' time records it be found that a vehicle has been driven at excessive speed, the vehicle will be disqualified.

Observers on cars will be charged not only with seeing that fuel tanks are not replenished during the run, but also with taking notes of the times of arrival at various points. Vehicles will be disqualified if they are driven fast through traffic or towns. The speed in High Wycombe should be very slow, and also through West Wycombe. Speed must also be slow in Ealing, Southall, Uxbridge, Beaconsfield, and other towns or villages.

Fuel.—Vehicles should carry with them—(a) At the outset, at least sufficient fuel in their tanks for a run of 31 miles; (b) in spare cans, sufficient for 4 miles up-hill (average gradient 1 in 15); and (c) in spare cans, sufficient for the return run of 31 miles. There will be no spare fuel at Dashwood Hill.

THE MOTOR-CAR TRIALS AT GLASGOW.

The following are the recommendations made by the Glasgow Trials Sub-Committee, which are to be placed before the Committee of the Automobile Club at its next meeting. In the meantime manufacturers or members who have suggestions to make are invited to send them without delay to the Club Secretary for submission to the Committee.

Number of Days.—Five, viz., Monday, 2nd, to Friday, 6th, of September.

Average Distance per Day.—90 to 110 miles, to end daily at the Glasgow Exhibition, giving as far as possible a total of 500 miles.

There should be a Trial Run every day. Vehicles to be in Glasgow at the place appointed on Friday morning, 30th August, at 10 a.m.

Daily Time of Start.—8 a.m.

Speed Rules.—In order to prevent excess in speeds vehicles will not be permitted to pass certain points before the expiration of a certain period from the time of starting, plus the total time occupied by stops, from all causes, since the start. If a vehicle arrives before time at one of these points and has to wait for the expiration of the period, the stop will be counted an involuntary stop, and marks deducted accordingly from the possible maximum of marks. Detours to avoid arriving at a point before time will be accounted as stops. No speed in excess of the legal limit will be recorded or recognised. Endeavours will be made to persuade the Secretary for Scotland to raise the limit from 10 to 14 miles per hour.

System of Marking.—There will be a maximum number of marks for each day's run, say 300, and one mark will be deducted for every minute during which the vehicle is at rest from the time of starting to the conclusion of the run except for—(a) Compulsory stop (if any) for luncheon; (b) Traffic; (c) Tyre trouble. There will also be deducted, in addition, one mark for every minute in excess of the official maximum time for the run, the marks for stops having first been deducted. The official maximum time will be the time which would be occupied by a vehicle in traversing the trial route at the maximum legal speed plus the extra time occupied in controls and dangerous zones.

Awards.—There will be no prize fund and no cash prizes. In the Manufacturers' and Agents' Section first prize and second prize medals will be given in each class. Certificates will only be given in respect of vehicles which have made an average of not less than 8 m.p.h. on the total Trials, after deducting loss of time by control limits and tyre troubles.

The awards will be made by a Judges' Committee, which will, in making their awards, take into consideration the marks gained, the design and workmanship, general performances, condition (at end of Trials), seating capacity in comparison with price of the vehicles, and the reports as to the observance of rules by the drivers. In the Private Owners' Section no competitive awards will be made, but commemorative medals will be given in respect of vehicles which successfully complete the Trial.

Display of Vehicles at the Glasgow Exhibition.—It is proposed to exhibit the vehicles daily at the Glasgow Exhibition.

Hill-Climbing Trials.—The Trials will comprise certain hills on which records will be taken of the time taken by the various vehicles in making the ascents. These records will be published, but no speed in excess of the legal limit will be recorded or recognised.

Delivery Vans and Heavy Motor Vehicles.—Provided that six vehicles are entered there will be a special class for delivery vans and motor vehicles designed for heavy loads, of a tare of not more than three tons. These vehicles will run under observation, over courses of from 20 to 50 miles per day.

A seat must be placed at the disposal of the Committee for an observer on each vehicle.

Tyres.—The tyres on a vehicle may, subject to the approval of the owner of the vehicle, be entered for trial by the makers of the tyres for the Trial. The system of marking will be the deduction of one mark from the maximum number of marks for every minute's delay on the roads owing to tyre trouble. The condition of the tyres will be daily noted and recorded by the official observers. Tyres can only be entered for competition if they are fixed to vehicles in Section I., viz., motor vehicles entered by manufacturers or agents. A vehicle may be specially entered under Section III. (tyres and other parts) with a view to testing tyres, not the vehicle.

Other Regulations.—Generally speaking, other regulations will be similar to those which controlled the 1,000 Miles Trial of 1900.

Electrical Vehicles.—In the event of makers of vehicles propelled by electricity expressing their willingness to enter vehicles to run over suitable distances during the course of the above trials, inquiries will be made and further particulars will be published.

The Scottish Automobile Club is taking an active part in the organisation of the English Trials at Glasgow. The Scottish Club have promised to make the necessary arrangements with the authorities of the Glasgow Exhibition, to bring the matter before the Government authorities, to fix upon suitable routes, to assist in finding observers, in marking the routes, and in finding hotel accommodation, etc.

MOTOR-CAR OBSTRUCTION.

SIDNEY PARSONS, a motor-car driver, pleaded not guilty at the Bournemouth Borough police court to obstructing the free passage of the Old Christchurch Road on the 4th of April. P.C. Hastings said he saw

the defendant drive up to the entrance of the Town Hall Avenue with his motor-car behind a 'bus which had drawn up. He took up a passenger, and he told him to go on. He pulled out in the middle of the road, but refused to go on until the 'bus had gone on. There were five other vehicles behind, and there was a great deal of traffic in the road at the time. When he moved into the middle of the road, the motor-car timekeeper told him not to go on. The defendant said that he could not go on owing to the amount of traffic in the road at the time. There was the 'bus in front of the car, and a 'bus on the other side of the road, and so he could not move out for fear of a collision or an accident with one of the vehicles, as there was not room between the 'buses on the opposite side of the road for his car and the vehicle passing up and down the road to pass. He called the motor-car timekeeper and inspector, Mr. Frescoe, who said he was at the entrance of the Town Hall Avenue at the time the defendant came up behind the 'bus, which had drawn up, and was standing in front of the Town Hall Avenue. He (the defendant) no sooner drew up than the constable told him to go on. He told the defendant not to go on as he thought there was great danger of an accident occurring if he did. The 'bus in front of the car had stopped for two or three minutes, although he did not think there were any passengers getting on or off it. In reply to Superintendent Foster, witness said he did not interfere with the constable doing his duty. It was always his wish to help the police, and not do the other thing.—The Bench imposed a fine of 2s., and 2s. costs.

MOTORIST EXONERATED.

AN inquest was held recently at Hasland, Derbyshire, on the body of John Tomlinson, of Wadshelf, who was crushed to death by the wheels of a cart he was driving passing over him. At the time the accident occurred a motor-tricycle passed by, and it is alleged frightened the horse. In trying to stop the animal Tomlinson was drawn under the cart and killed. In giving evidence, John Thomas Dring, of Hasland, said he was trying the motor-tricycle belonging to Mr. Atkinson, after having repaired it, and he started about forty yards before he met the deceased. He saw the deceased before he started; he was walking on the footpath, his horse and dray being at the opposite side of the road. When he saw witness deceased started towards his dray, and witness passed him. Witness did not, as alleged, pass between the man and the dray. When he passed the horse it was going very quietly. He did not remember blowing the horn in passing, but he did so just after passing. He did not hear of any accident until about two hours afterwards. The motor was going at the rate of four or five miles an hour. The coroner, in summing up, said there was no blame to be attached to anyone. He thought that the horn and car might have startled the horse, yet there was the possibility of something else having done so. If deceased had been nearer his horse he might have checked it. A verdict of "Accidental death" was returned.

BARON v. THE THORNYCROFT STEAM WAGON COMPANY'S CLAIM.

MR. JUSTICE BRUCE and a special jury had before them on Monday an action in which Mr. Francis Edward Baron, consulting engineer, Manchester, sued the Thornycroft Steam Wagon Company, Limited, to recover damages for alleged breach of an agency agreement, which the defendants said they were entitled to put an end to in consequence of the plaintiff's conduct. The plaintiff's case was that in February, 1899, he was connected with the Motor Haulage Company, of Bolton, whose object was to supply motor-wagons for carrying goods traffic on roads. It appeared that plaintiff learned that Messrs. King and Co., calico printers, of Hollington, were anxious to adopt motor-cars to convey their goods to Manchester, and as the Motor Haulage Company could not undertake the work he obtained tenders from defendants, which were accepted. Subsequently he was appointed their agent, undertaking to get them orders for motor-cars each year. The defendants, however, failed to supply the cars they had contracted for, and put an end to the agreement.

The hearing was continued on Tuesday. The plaintiff claimed damages for breach of an agreement under which he was to receive 7½ per cent. commission on sales of the defendant company's motor wagons. The jury found for the plaintiff, damages £340, and judgment was entered for that amount, with costs.

FURIOUS DRIVING CASES.

AT the Bournemouth Borough Police Court, William Penton, a motor-car driver, pleaded not guilty to driving his car at a furious rate in the Poole Road on April 4th. P.C. Davis said he was standing near the Royal Victoria Hospital when the car passed him. It was being driven at the rate of about fourteen miles an hour. He saw the car about two hundred yards before it passed him, and saw it go down the road over the Poole Hill. He hailed the driver as he passed. He took no notice, but he did not know whether he saw him or not. It was a public car, with one or two passengers in it. The traffic was thick, several cabs coming from the West Station down the Queen's Road at the time. In reply to Mr. C. R. Hutchings, who appeared for the defendant, the constable said he judged the speed on his experience as a cyclist. The defendant went into the box, and said he had been a motor-car driver for three and a half years, and had been in his present employ for eight

months. He had never been summoned before for going too fast. On the occasion in question, he was going at the rate of about ten miles an hour. The high speed of the car, when the engines were running at full, was twelve miles an hour. Mr. Hutchings said the Canford Cliffs Motor 'Bus Company, whom he represented, had been running for a considerable time in the town, and there had never been an accident with one of their motor-cars. He submitted that there had been no evidence to show that the speed at which the car in question was being driven was a speed that was dangerous to the public, and he asked, on that ground, that the case should be dismissed. The Bench convicted, and fined the defendant, against whom there had been no previous conviction, 1s. and 8s. costs.

AT the Chertsey Petty Sessions, Harry R. Parton, engineer, 27, Essenden-road, Paddington, was summoned for using a light locomotive to draw another vehicle, which did not bear his name and address or place of business; and further, with driving at a greater speed than six miles an hour, at Weybridge, on April 7th. The defendant pleaded not guilty. Inspector Marks stated that he saw the defendant driving a motor-tricycle at ten or twelve miles an hour. A two-wheeled car was attached to the tricycle. There was no name or address on the car. The defendant said he had to pay a full license for the tricycle and car as one vehicle. In reply to the Bench, the defendant said he bought the car and attached it to the tricycle. Fined £1 in each case.

AT the Greenwich Police Court on Tuesday, Frederick Rowe, of Shooter's Hill, was summoned for furiously driving a motor-cycle. Police-constable 44 RR. said he saw the defendant on April 5th driving at the rate of fifteen or sixteen miles an hour. He timed the defendant, and found that he covered a quarter mile up hill in less than a minute. He stopped when the witness held up his hand. The defendant said the speed suggested was impossible considering the traffic. Mr. d'Eyncourt said it was very dangerous to run motor-cycles at this rate. There should, he thought, be some way of identifying motor-cars, by number or otherwise. He fined the defendant 30s. and 2s. costs.

By a decision of the Nice Automobile Club, there will be no special section for steam or electric cars in the Nice La Turbie course and mile race at Nice next year.

THE committee of the French Automobile Club has decided not to reopen the club's summer quarters in the Bois de Boulogne, and the property, consisting of two villas, standing in their fine grounds, are now to let.

THE Daimler Motor Company, Ltd., sued the Newport Pagnell Motor Company, last week, for £5 18s. 6d., for a set of spokes for the wheels of a motor-car. The defence was that the charge was an exorbitant one, and that the thirty-two spokes were only worth 1s. 6d. each. The spokes had been returned. The Judge observed that the company should not have done that. There would be judgment for the plaintiff company for £4 16s.

THE Caledonian Motor-Car and Cycle Company, Ltd., 265, Union Street, Aberdeen, inform us that the statement that they have been appointed sole agents for Scotland for Messrs. Panhard and Levassor, of Paris, is not correct. The facts are that they have been appointed by the Société des Automobiles Peugeot, of Paris, their sole agents for the whole of Scotland for the Peugeot motor-vehicles, motors, and frames. The Caledonian Company have a large establishment in Aberdeen, comprising workshops, inspection pit, storage accommodation, and have every facility for repairing motor-cars of any make, storing, and cleaning same. They also keep motor spirit in stock, and can recharge accumulators, etc.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, MAY 4, 1901.

[No. 113.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Right Honourable Sir J. H. A. Macdonald (Lord Justice Clerk of Scotland) has written us on the subject of horse-drawn vehicles at large on the highway. The Lord Justice Clerk states that recently he travelled from London to Grantham by motor-car, and that on the way he passed seventy-one vehicles with horses, no one being in charge, at least twenty of the cases being at the doors of public-houses. Two drivers were so fast asleep that the loudest tooting only woke them when the car was close behind. In conclusion the Lord Justice Clerk asks: "Is it for the protection of such breakers of the law that new laws are to be made to place motorists in an invidious position to which the owners of horse-driven vehicles are not subjected?"

Demonstration at Gloucester.

ON the initiation of the Automobile Club, a motor-car demonstration was held at Gloucester on Saturday last, with the object of showing the members of the Highways Committee of the Gloucestershire County Council the ease with which motor-cars can be managed. There was a good muster of cars, including Mr. Algernon Wyatt's Benz, from Cheltenham; Dr. Abbott's New Orleans, from Cheltenham; Mr. Charles D. Phillips; "Lifu" steam wagonette, from Newport; Mr. J. T. Hereford's 6 h.p. Daimler, from Hereford; Mr. Downson's De Dion voiturette; Messrs. Norton and Co's. New Orleans voiturette; the Bristol Motor Company's Daimler phaeton, from Bristol; the same company's Progress car, driven by Mr. Appleton; Mr. Morgan's Star phaeton, from Cheltenham. Dr. Fernald was present on a motor-tricycle from Cheltenham. Among the members of the Highways Committee and others who occupied seats on the cars were the Lord Justices' Clerk of Scotland, Sir John Dorington, Sir James Campbell, Mr. M. W. Colchester-Wemyss (chairman of the Council), Rev. Canon Bowers, Major Seymour-Metford, Messrs. H. O. L. Baker, J. R. Lane, W. S. Walker, E. Playne, J. S. Gibbons, W. Friday, R. N. Hooper, F. Haine, E. T. Gardem (Clerk of the Peace for Gloucestershire), Mr. Johnson, etc. Trips were made along the country roads to Huntley and Hartpury and back, where the Saturday traffic gave motorists an exceptional opportunity of displaying the ease with which motor-cars can be managed. The members of the Highway Committee expressed themselves as highly gratified with the manageability of the motor-cars.

The London County Council and Motor Fire Engines.

IN our issue of last week we referred to the movement on the part of the Metropolitan Fire Brigade for the introduction of motor fire engines. Commander Wells has subsequently come to the conclusion that the best system will be that of steam and liquid fuel, and his idea is to obtain a vehicle which not only could be usefully employed by the third officer

and the officers of the inspection branch, but which would also afford an opportunity of teaching a good many firemen the mode of manipulating motor vehicles. At a meeting of the London County Council, held last Tuesday, on the recommendation of the Fire Brigade Committee, it was decided to purchase from the Locomobile Company of America a motor-car at a cost of £286 for use by the Fire Brigade. Mr. Beachcroft objected to the Council going to America to purchase a car when any number could be obtained in this country. Mr. Gilbert, Chairman of the committee, said that the chief officer, who was an expert on this subject, had recommended that particular type of car.

Motor-Cars for Municipal Purposes.

MR. JOHN MORLEY, the Borough Engineer of West Ham, in reporting on the reorganisation of the Highway Department of the borough, makes some interesting observations on the employment of motor-cars for public purposes. He sets out the advantages of this form of traction as follows:—Heavier loads can be taken at practically twice the speed, and therefore in half the time occupied on the journey by horses. There is practically no limit as to the time they can remain at work, except that it would be necessary to work them by shifts. They can be obtained with interchangeable parts, so as to be available either for carrying road sweepings or for street watering, as occasion may require. The expense of erecting buildings for storage would not be so great as providing stables for horses, as sheds only would be required, and, again, as they do more work so many would not be necessary and the space would be further minimised. On the other hand, Mr. Morley points out the first cost is considerable, and the repayment charge would have to be met, and to obtain good results it would be necessary to keep them at work for as long periods as possible. There is no doubt, he adds, that, as the district develops still more, it will be necessary to travel further afield for shoots, especially for the deposit of house refuse, in which case the advantage derived from the extra-speed of the motor will be more appreciated.

Public Opinion.

THE prominence of motor-cars at Epsom last week gives the *Daily Telegraph* occasion for a leader in which, after a regretful tribute to the æsthetic advantages of the horse, a timely attack is made on the evil done by our short-sighted legislation in obstructing progress and on the absurdity of the present speed restrictions, particularly with reference to the baneful effect they will have, if enforced, on the important trials to be held at Glasgow. It is still more encouraging to see a friendly attitude manifested toward motor-racing, which is characterised "as much more exciting to the taste of democracy" than horse-racing "as football is compared with cricket," and it is to be feared that this will prove a more potent aid to its introduction than its manifest necessity for "improving the breed" of the automobiles. Mr. Mayhew's description of the way in which the necessities of speed have acted in

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

evolving brakes of a power unknown in this country is significant, as bringing out a weak point in many of our home productions, and one which legislation would do far better to direct its attention to, if it must be occupied with something, than to childish numbering schemes.

Competitions.

IN default of races, however, we content ourselves with "competitions," which might be equally effective in stimulating improvement were it not for the power of sentiment. In other words, the maker will do all in his power to "get there first," while he will not exert himself to make his car approach certain tabulated figures, though these may be the measure of equally marked improvements. "Improvements," however, apart from speed, are somewhat difficult to gauge; the average driver is not so particular about economy of running and efficiency of transmission as about freedom from all the little derangements that are of much more practical importance to him than a pint or two of petrol, and is perhaps inclined to undervalue the importance of researches to this end. The most noticeable result of the recent consumption trials at Richmond was perhaps the very slight difference in consumption between the cars of very varying size, or otherwise the superior economy of larger engines. This week's trials are almost unique in their severity from the hill-climbing point of view, though the unavoidable descent between each of the six ascents of Dashwood Hill will not give that test of cooling efficiency that a four-mile climb otherwise would, and the ardent members of the Technical Committee perhaps sigh for a hill like the Irishman's steep staircase, of which he complained that "for once he came down it he had to go up half a dozen times."

Yorkshire Automobile Club.

THE members of the Yorkshire Automobile Club held the third run of the season last Sunday, when a visit was paid to Harrogate and Ripon *via* Bradford and Otley. The start was made from Leeds City Square promptly at nine o'clock. At the main entrance to Manningham Park, Bradford, the party was joined by the Bradford contingent and a quick run was made to Harrogate, where lunch was partaken of at the Victoria Hotel. From Harrogate the party proceeded to Ripon, and after a short stay the return journey was commenced at 3.30 p.m., Leeds being reached in good time. The run was regarded as one of the most successful that has yet been held.

County Councils and Motor-Cars.

THE Berks County Council are making strenuous efforts to gain the support of other councils with regard to the numbering and registering of motor-cars and making the pace ten miles an hour. The proposals of the Berks County Council came before the Lindsey County Council the other day, when the resolution of the Highways Committee, viz., that they do not at present deem it necessary to make any recommendations respecting the matter, was carried without discussion or dissent. Mr. C. Johnson, secretary of the Automobile Club, as representing that body and the Lincolnshire Automobile Club, attended the meeting of the Committee as a deputation, and explained how unnecessary and harmful the proposals were. He showed how beneficial motor-cars would be to an agricultural county like Lincolnshire, and advanced other good arguments.

Reckless Driving in Bradford.

THE Bradford papers during the past few days have been full of angry letters protesting against the reckless driving of a motor-car through Manningham Lane. At first we regarded the protests as the outcome of a biased public, but since we have been informed on reliable authority that the life and limb of pedestrians have been seriously endangered. Even the most

ardent local devotees of motoring have entered their protests, pointing out that by careful driving in busy thoroughfares they were trying to lessen the prejudices of the Bradford public against the motor-car. We can only hope that the delinquent in this case will soon be unearthed, and that then he will meet with the full penalties he so richly deserves at the hands of justice.

The Motorist Wins.

AN Essex correspondent writes us with regard to an amusing incident which occurred on the road the other day. As he was out driving with his wife in a voiturette, on rounding a corner on the up grade, he suddenly came on a wagonette drawn by two horses and containing two ladies—of course on the wrong side of the road. Seeing that the coachman did not intend to pull over to the right side of the road the motorist stopped, with the horses about ten yards ahead. The coachman also pulled up—still on the wrong side of the road—and the two drivers sat motionless and looking helplessly at each other. Suddenly the coachman in a gruff voice said to the motorist, "Now, what are you going to do?" The motorist replied, "Smoke till you clear the road." Two or three minutes sped by without a remark from either, when the coachman with rising anger broke out again: "Now, then, what are you doing?" Motorist: "Smoking, and enjoying the scenery." This, however, was too much for the fair occupants of the wagonette, who were highly amused, and suggested to the irate Jehu to pull over to the right side of the road. This the driver did with little grace and less speed, and the motorist sped off and was soon out of sight.

The Nottingham Automobile Club.

THE last meeting of the session in connection with the Nottingham Automobile Club was held on Wednesday in last week, and took the form of an informal dinner, at which the Lord Justice Clerk of Scotland (the Right Hon. Sir J. H. A. MacDonald) and Mr. Claude Johnson, secretary of the Automobile Club of Great Britain and Ireland, were the guests of the evening. Mr. E. W. Wells (vice-president) occupied the chair. The primary object of the gathering was to hear an address from Mr. Johnson bearing upon the proposed schemes of affiliation with the Automobile Club of Great Britain and the formation of a Motor Union. Mr. Johnson gave a short sketch of the Club's inception and development. Originally it was organised on social lines, but it had been found necessary to take up the work of advancing the interests of automobilism, and instances were given of the efforts which had been put forward in the hope of influencing the governing authorities to facilitate the advance of the movement. Already much had been done in respect of the County Councils to overcome prejudice in relation to the ridiculous speed restrictions which had been enforced, but Mr. Johnson declared that the fight had only just begun, and in order that they should be prepared for the struggle it was imperative that they should take combined action. Mr. Johnson explained the scheme which had been proposed, and emphasised the necessity for concerted action. The Lord Justice Clerk of Scotland spoke of the importance of establishing a *bon camaraderie* among automobilists, and declared that if only the County Councillors and farmers, and residents in the rural districts could exercise a little foresight they would see perfectly well the enormous advantage which automobilism was going to confer upon districts which were not served by the railways. Indeed the time was coming when the railways themselves would start services of motor-cars to act as feeders to their own undertakings. Within the next twenty years automobilism would be found to be a vast source of national wealth. Upon the proposition of Mr. Wells, the meeting decided unanimously to adopt the affiliation scheme. Mr. A. Atkey, hon. sec. of the Nottingham Club, proposed the health of "The Visitors," which was cordially acknowledged by the Lord Justice Clerk of Scotland and by Mr. Johnson.

The Correct View.

"THERE is not the slightest doubt," says *Country Life*, "that those of us who drive about in the country and complain that our horses are frightened by the motor-cars have ourselves, in very large measure, to thank for our horses' and perhaps our own, fright. None of us are so far removed from the home of a motor-car that we cannot send our horses over to have a feed of corn beside it, and so grow accustomed to the strange thing; and no owner of a motor-car is so churlish that he would not give permission for horses to go to his stables and receive this lesson. If we had but the energy to see that this was done once or twice, our horses would soon grow used to the motors." It is with the greatest pleasure that we find our contemporary advocating and acknowledging principles which we have always supported in these columns.

Motor-Cars in West Africa.

LATEST advices from West Africa indicate that the use of motor-cars is being seriously discussed as a means of transport for a large part of the Gold Coast mining companies. A railway is in course of completion from the coast to Kumassi, but it is far from practicable that offshoots of the railway can be constructed owing to the nature of the ground. Therefore roads are being constructed with the view of running motor cars as "feeders" to the railway. In this way not only will native carriers be done away with, but the capacity of transport will be greatly increased. In certain quarters of West Africa the motor-car service has been tested, with the most favourable results.

An Engineer's Testimony.

IN connection with this matter the following extract, taken from the official report of the Northern Territories by the late Colonel Northcott is of interest—"The recent improvements in motor-cars suggest these vehicles as a means of transport vastly superior to carriers, and as providing some at least of the advantages of railways without any of their drawbacks. Roads suitable for them can easily be constructed; and where, as in the Northern Territories, the administration has taken over the chief's power of exacting free labour, the cost of this work is very small. No ambitious bridging schemes need be thought out, for culverts can easily be made locally to bear the weight of a motor-car and its load, and the large rivers are so placed that they would naturally be taken as junctions for the car service, the goods being ferried across. The original outlay would be relatively very small, and so also would be the number of men employed in the working of the line. A fair load would be carried each trip and would perform the journey, in favourable circumstances, in one-fifth of the time at present occupied. There are now in existence in the Northern Territories over seventy miles of made road on which motor-cars could without difficulty run at good speed." If these are opinions of a responsible official perfectly acquainted with the country, there can be no doubt, considers the *Gold Coast Globe*, that the future of the motor-car in the West Coast of Africa in general, and on the Gold Coast in particular, is an exceedingly promising one.

Peccavi!

OUR remarks on the subject of motor-bicycles in our last issue have, as will be seen from the Correspondence columns, attracted some attention. Mr. Leonard, of the Motor Manufacturing Company, has also given us ocular demonstration with a Werner motor-bicycle that our contributor is wrong in his objections to the two-wheeled machine. The bicycle was without difficulty carried up two flights of stairs, laid on its side, placed by the kerb—in fact, all the objections we brought forward against motor-bicycles have been shown to be non-existent, at least in the Werner.

Activity along Holborn.

THE policeman who regulates the traffic that crosses Holborn at Southampton Row is fairly familiar with motor-vehicles, and has learned their ways to a nicety. He allows them to come close upon him before raising his hand, and realises that they can be more readily stopped than the horses with which he has to deal. But this week he has had a particularly busy time, for on Tuesday, Wednesday, and Thursday there were more automobiles up and down Holborn than in any previous ten or twelve days of the year. One policeman walking along Oxford Street confided to us that he could not account for the sudden burst of automobile activity; but that something unusual was about to take place he could quite realise, for in one hour more than twenty cars had passed him; and riding on a horse-drawn 'bus from Shoe Lane to Tottenham Court Road we counted seventeen motor-vehicles on the road—and all going well. Evidently the proximity of the Exhibition has been responsible for the presence of so many cars, agents and manufacturers having put vehicles to stern tests in order that all may be right at "Merrie Islington."

THE EASTER TOUR—WHITE HART STABLES, SALISBURY.

THE *Concours de Carburants*, organised by the French Automobile Club, commenced on Wednesday last.

THE Corporation of the City of Glasgow are asking for tenders for the construction of a motor dust van. Full particulars may be had from Mr. D. McColl, Superintendent of Cleansing, City Chambers, 64, Cochrane Street, Glasgow. Tenders must be sent in by Monday, the 13th inst.

ELEVEN cars entered for the Special Hill-Climbing and Consumption Trials, held on Thursday, with the object of giving makers and agents an opportunity of subjecting their vehicles to official trial before they were exhibited at the Agricultural Hall, and in order that the vehicles might have attached to them at the Exhibition official certificates of their performance.

ON Wednesday next, at 8 p.m., the Automobile Club will hold a dinner at the Agricultural Hall, Islington, in connection with the Exhibition, when it is probable that Sir Francis Jeune will take the chair. Members who wish to participate in the dinner may obtain tickets from Mr. Chas. Cordingley at the Exhibition, or from the Club Steward. Morning dress may be worn. Friends (gentlemen, not ladies) may be introduced.

A MARRIAGE by motor-car took place recently at Christ Church, Guildford. The bride was Miss Bird, a well-known Guildford lady, and the bridegroom Mr. Wade, a cycle and motor-car maker. The bridegroom, accompanied by his best man, drove up to the church in the motor-car, and after the ceremony the newly-wed couple started straight away from the church on the car for their honeymoon.

THE ENGLISH MOTOR CLUB'S CONTROL CONTESTS.

A VERY moderate assemblage of the public foregathered at the Crystal Palace on Saturday to witness the "control contests" of the English Motor Club. Had the affair been "pushed" in any way the attendance would undoubtedly have been larger, for the weather was all that could be desired. Perhaps it was just as well, however, that there was no crowd, since the avowed objects of the meeting were very far from realised, and in more senses than one the word "control" was the last that could legitimately be used in connection with the proceedings. These were announced to open at half-past two, but it was nearly an hour later when the actual start was made.

The events, moreover, were by no means calculated to display the starting and stopping powers of the competing cars.

quickness with which a car can attain speed, and yet be stopped within a short distance, and thus the car occupying the shortest time between two points will be given the prize."

This was all admirable enough in intent, but for lack of management it fell short in execution. The only way in which the stopping and starting control was shown was at the six stations before referred to, but all save one of these were out of sight of the spectators, unless they wandered to the foot of the Palace grounds, which very few appeared to do. The only stopping and starting which nine-tenths of the beholders saw, was at the north end of the Terrace, where each competitor was detained by one of the timekeepers, Mr. Bidlake, whenever any returning car was signalled from below; otherwise two cars going in opposite directions might have met at one or other of a series of five awkward corners in quick succession. But the compulsory stops at this point were not of the prescribed thirty seconds duration, but depended upon the varying times made by

MR. T. MALTBY, JR.'S 10 H.P. DE DION SPIDER.

MR. C. JARROTT ON HIS 10 H.P. DE DION SPIDER.

MR. MARK MAYHEW'S 20 H.P. PANHARD.

MR. J. H. LEONARD AND HIS WERNER MOTOR BICYCLE.

According to the programme the *modus operandi* was as follows:— "These contests, as set out in the programme, are held with the idea of demonstrating to the public the control in starting, stopping, and steering to which an autocar is completely amenable. The course, as marked on the accompanying plan, is laid out with a view to providing a fair give-and-take road, such as is required to fairly test the skill of the driver, and the power, design, and general mechanism, of the motor-cars and cycles competing. The competing cars have to stop at each of the stations numbered on the line of route, and start again on a given signal from the control marshal within a space of 30 secs. Obviously the car which makes the best progress in between the stations, which stops quickly, and which starts again quickly, will score over one which is more speedy, but is slower in starting and stopping. The lowest aggregate time between start and finish will thus declare the winner in each case of these control contests. The last item on the programme is to show the

the ascending car, if one was signalled. Most of the spectators congregated at this spot, apparently for the sole purpose of seeing the cars swing round a double corner, so that it was merely as regards steering that they derived any real appreciation of the handling of a motor-car. Even at the finishing post, where stood nobody but Mr. Swindley, as timekeeper, and half-a-dozen others, there was no measuring of the distance within which each car stopped after its final rush, although the figures would have been most instructive.

Several of the competitors, indeed, did not even know where the finishing point was, and never reached it, or slowed down to round the very corner which they ought to have passed at top speed along the straight. At the finish of the 200 yards speed contests with which the proceedings concluded the time element was the only one considered, no account being taken of the number of yards within which the vehicles were stopped, although the programme specifically laid down the ability to stop

within a short distance as one of the features to be emphasised by the competition. In fact, if the events had been confined in the main to the long terrace, with careful measurements and tabulated results, there would have been something more impressive for the actual spectators, and more definite to report to the general public than was actually the case, for the fact that this or that car careered around the grounds, over a course which was mostly invisible, and of which no one knew the exact measurement, conveyed little or nothing in the shape of a lesson in motor-car control.

Appended is the list of entries in the various classes:—

CLASS A.—MOTOR-BICYCLES.

No.	Name.	Maker.	Horse-power.
1.	J. H. Leonard	Werner Frères	1½
2.	Motor Manf. Co.	Werner Frères	1½

CLASS B.—MOTOR-CYCLES (FREE ENGINES BARRED).

6.	J. W. Stocks	Ariel Motor Co.	3
7.	J. C. Nixon	De Dion Bouton	3½
8.	T. Maltby, junr.	De Dion Bouton	2½
9.	M. Moyle	De Dion Bouton	3½
10.	F. G. Lewin	Motor Manf. Co.	2½

CLASS C.—MOTOR CYCLES WITH FREE ENGINES.

12.	G. H. Smith	United Motor Industries	2½
13.	Hon. C. S. Rolls	De Dion Bouton	2½
14.	C. Jarrott	De Dion Bouton	2½

CLASS D.—CARS DRIVEN BY LADIES.

16.	Mrs. E. Kennard	Napier	9
17.	Mrs. Moyle	De Dion Bouton	3½
18.	Mrs. Taplin	Star Motor Co.	3½

CLASS E.—VOITURETTES UNDER 6 H.P.

21.	G. H. Smith	United Motor Industries	4½
22.	G. D. Barnes	Peugeot Frères	4
23.	Motor Manf. Co.	Motor Manf. Co.	5
24.	M. Cappellen	Sports Motor-Car Co.	5
25.	G. Taylor	Benz & Co.	3
26.	C. Jarrott	De Dion Bouton	4½
27.	R. H. Fuller	De Dion Bouton	4½
28.	A. Burgess	Motor Manf. Co.	5
29.	A. Connell	Benz & Co.	4½
30.	Motor-Car Co.	Société Decauville	5
31.	M. Moyle	De Dion Bouton	3½
32.	W. Munn	De Dion Bouton	4½
33.	F. G. Lewin	Motor Manf. Co.	5
35.	H. Sharp	Mors	5

CLASS F.—CARS OVER 6 H.P. AND UNDER 12 H.P.

36.	Hewetson, Ltd.	Benz and Co.	6
37.	S. H. Pearce	Napier	9
38.	Motor Manf. Co.	Motor Manf. Co.	6
39.	A. Burgess	Motor Manf. Co.	6
40.	E. H. Clift	Sinclair Motor-Car Works	7

Of these the majority were on the ground, though not all competed. The light steam cars had decidedly the best of it over a course containing numerous corners, two of which were so bad that it was almost impossible to get big racing cars like the 24 h.p. Mors of the Hon. C. S. Rolls, or the 20 h.p. Panhard of Mr. Mark Mayhew, round without going over the grass. Several competitors were disqualified for not pulling up sharply enough at the stopping places, and crossing the tape. In the way of excitement the chief item was the puncturing of one of the back tires of Mr. Jarrott's 10 h.p. De Dion Spider, with resultant swerves that were by no means comfortable to behold, as one of the tires came off and made the steering tricky in the extreme. In the 200 yards sprints fine finishes were made by Messrs. Rolls and Jarrott.

The following were the best performances in each class:—

Class A.—Mr. J. H. Leonard (Werner), 6 min. 17 sec.

Class B.—Mr. J. W. Stocks (Ariel), 8 min. 31 3-5 sec.

Class C.—Mr. C. Jarrott (De Dion), 6 min. 23 3-5 sec.

Class D.—No award. The two starters, Mrs. Kennard and Mrs. Moyle, were both disqualified.

Class E.—Mr. C. Jarrott (De Dion), 6 min. 26 sec.; Mr. R. H. Fuller (De Dion), 6 min. 37 3-5 sec.; Mr. G. D. Barnes (Peugeot), 7 min. 36 sec.; Mr. H. Sharp (Mors Petit Duc), 7 min. 46 3-5 sec.

Class F.—Mr. H. du Cros (Napier), 6 min. 27 sec.; Mr. S. H. Pearce (Napier), 6 min. 35 sec.; Mr. W. du Cros (Napier), 7 min. 5 2-5 sec.; Mr. Coles (Benz), 7 min. 45 sec.

Class G.—Hon. C. S. Rolls (Mors), 6 min. 13 sec.

Class H.—Hon. C. S. Rolls (Mors), 5 min. 51 sec.

Class I.—Mr. R. H. S. Abbott (Locomobile), 5 min. 41 sec.; Mr. W. N. Letts (Locomobile), 5 min. 59 3-5 sec.

Class K.—Shippey Bros, 9 min. 36 3-5 sec.

200 YARDS SPEED CONTESTS.

Hon. C. S. Rolls (Mors), 13 3-5 sec.; Mr. C. Jarrott (10 h.p. De Dion) 13 3-5 sec.; Mr. S. F. Edge (6 h.p. De Dion), 15 sec.; Mr. A. W. Ginder (Locomobile), 15 2-5 sec.; Mr. R. H. S. Abbott (Locomobile), 15 3-5 sec.; Mr. J. H. Leonard (Werner bicycle), 18 1-5 sec.

Mr. Mayhew also went over the course in 15 4-5 sec., and Mr. Letts in 19 1-5 sec.

The officials of the meeting were as follows:—Judges: Messrs. H. L. Clarke, L. Schlentheim and A. J. Wilson. Timekeepers: Messrs. F. F. Bidlake, A. V. Ebbelwhite and H. J. Swindley. Hon. Secretary, Mr. F. W. Baily.

A RATHER novel use for the motor-car is suggested by a Lincolnshire rector. The doom of country schools seems near at hand, and it is proposed to create educational centres to which children from outlying districts shall be conveyed by motor-car. In the morning outward journey the motor-car will carry the post, and on the return journey the children; in the evening *vice versa*. The children would be delighted.

In the competition held by the Worshipful Company of Coachmakers for improved designs on the present type of military ambulance—now condemned by the Royal Commissioners—the first and second prizes were won by Messrs. Atkinson and Phillipson, carriage manufacturers of Newcastle. One of their draughtsmen, Mr. Terry, gains the first prize, while Mr. John Phillipson wins the second, the third going to Mr. Butler, of the London Polytechnic carriage-building class.

MESSRS. DE DION BOUTON, LIMITED, inform us they are making engines specially for small launches, in two sizes, namely, 3 h.p. and 4 h.p. They are fitted with patent De Dion two-speed and reversing gear, which has been specially designed for this particular purpose. The motor, gear, etc., complete, stands on an aluminium base measuring 35in. by 16in. They also have two boats on order fitted with these engines, which they hope to receive delivery of shortly. A boat, namely, *Lou-Foc*, fitted with a De Dion engine, won the first prize in the motor-boat races held at Vincennes during the Paris Exhibition.

FLOTSAM AND JETSAM.

BY "FLANEUR."

QUIANT memories are recalled by a photograph which has been added to the Automobile Club collection during the past week. It is that of the historic meet at Tunbridge Wells, on October 15th, 1895, when Sir David Salomons, to whom the automobile movement owes so much for his early efforts as a pioneer, invited great numbers of people to the town, of which he was then mayor, to view a partial realisation of Mother Shipton's prophecy as to "carriages without horses." The Comte de Dion was there, the Hon. Evelyn Ellis, and other pioneers, and mightily pleased they looked as the cars puffed round the lumpy ground at a pace which all but conformed to the then legal limit of four miles an hour. I doubt if the most sanguine of us looked forward, on the evidence then before us, to so rapid an advancement in the movement as has actually been brought about, and the fact is not without encouragement in the face of County Council opposition and popular prejudice alike. To those who only know the motor-car in its present highly efficient forms the cars we viewed at Tunbridge Wells would seem just as strange and puffing and snorting as they did to us at the time, for modern automobiles have been improved almost out of all verisimilitude to their prototypes.

It is with no small regret that one learns the impossibility of the Irish Tour in August next being so planned as to include a night at that paradise on earth, Glengarriff. I will undertake to say that most of the members of the party, when they make their mid-day halt on Wednesday, August 14th, will be very strongly inclined to go on strike and abjure the official programme, and only stern necessity, in the shape of inadequate hotel accommodation for so large a party, will compel a forward move. The Poet Laureate has defined Glengarriff as "a haven of absolute beauty and perfect rest," and none who have seen the place will quarrel with Mr. Austin's prose, whatever their mental reservations on the subject of his poetry. This side of the Italian lakes there is no spot from which it is so difficult to tear one's self away; and, indeed, it is reported that an English tourist who went to Glengarriff thirty years ago was so enchanted with the place that he made it his home and never left it. Of the country included in the programme of the Irish Tour generally I can only say that it will prove a revelation to those who have never visited the Emerald Isle, and far exceed any pleasurable anticipations they may have formed concerning it.

THE fact that an accident has occurred to a motor-car descending Birdlip Hill recalls the difficulties which the descent presented to those members of the Automobile Club who took part in the autumn tour to Monmouth last October. Taken all in all the hill is about the worst in England so far as main roads are concerned, and possesses the unique distinction of a red lamp at the top bearing the imperative injunction, "Cyclists dismount," instead of the usual intimation "This hill is dangerous." It is not only a steep hill but a treacherous one, as the gradient moderates itself about half way down, and leads the unwary traveller to infer—though quite imprudently—that he has reached the bottom, whereas just round a corner it becomes acutely steep again.

At the same time, it is perfectly feasible to go down Birdlip Hill in safety on either bicycle or motor-car if properly equipped; so far as the latter is concerned it is purely a matter of knowing the hill before you reach it and taking precautions in time. If a car be started down the hill at ordinary speed, and then the driver attempts to slow up on discovering the severity of the gradient, he will have a sorry time of it unless he has water cooling to his brakes. But if he turns out his burners at the very top and utilises the compression of his engine, this, coupled with his brake-power, should be sufficient to take him down in safety, especially if a rear passenger keeps an eye on the hand brakes, and gives the word to stop as soon as they begin to smoke.

I know several automobilists who have descended Birdlip Hill in this way without trouble, and on the occasion of which I can speak from personal experience it was quite dark at the time. In the recent case of accident it is probable that the driver either started at too high a speed, or that his brakes fired badly and would no longer hold the car.

THE importance of smart finish in the carriage work of motor-cars is always curiously but emphatically displayed whenever the untutored public is brought into direct contact with an automobile function of one kind or another. Knowing absolutely nothing of horse-power, transmission, weight, or the various other items by which the expert takes his estimate of a given car, they are attracted simply by the general outlines and the colour of the enamel. At the Crystal Palace on Saturday, for example, it was amusing in the extreme to note the absolute contempt with which people unversed in motor lore passed by the 24 h.p. Mors of the Hon. C. S. Rolls and the 20 h.p. Panhard of Mr. Mark Mayhew, merely because they had racing bodies. Each of these five cars represented *le dernier cri* of its designer at the power named, but until they showed their paces the public turned their faces the other way, whereas those cars which were elegant in appearance were the cynosure of attention on that ground alone.

NOT that any harm was done, because there were no inferior types on the ground, and handsome vehicles like Mr. Roger Fuller's 16 h.p. Napier, and the heliotrope 12 h.p. car of the Motor Manufacturing Company, deserved all the approving comment they received. But from the uninstructed members of the gathering this approving comment would have come just the same if the cars had been veritable sticks-in-the-mud instead of highly efficient vehicles, capable of considerable pace. I cannot refrain from remarking that the Motor Manufacturing Company has taken a wise course in not only doing its own carriage-building, but also in bringing this department to a state of excellent organisation. All who have the cause of automobilism at heart must desire to see daily accessions of new recruits, and to bring these within the fold there is no manner of doubt but that appearance must be studied concurrently with efficiency. Inasmuch, moreover, as the carriage-building trade is giving automobilism the cold shoulder, it is hopeless to look for fertility of invention in that direction, and if motor-cars generally are to be invested with greater elegance of form or finish it should be from the motor trade itself that a reform should be awaited.

THE California Automobile Club is organising a floral parade for the San José Feast of Roses on May 13th, when President McKinley is expected to put in an appearance.

MR. C. H. GUEST, of Draycott, has lately introduced a useful little device in the shape of a plug adapter, which enables the standard De Dion plug to be used on Benz and similar types of engines. It is fitted with a boss to position the flange from, and to do away with altering the space in the combustion chamber, so that the conditions of the explosion are the same as with the usual plug.

A WORD of timely warning to motorists comes from Wilmslow, where two men were charged with stealing an overcoat and other articles belonging to Lieutenant Boutflower, of Manchester. Mr. Boutflower and a friend were out for a ride on a motor-car, when a breakdown occurred. In order to effect repairs Mr. Boutflower took off his overcoat and placed it on the side of the road, where it was afterwards missed.

UNDER the name "Weston Motors" a large new depot is about to be opened at 14, Mortimer Street, London, W., for the sale of a new steam-car, which comprises several novel features and which is remarkable for the simplicity of all its parts, and the ease with which it can be handled. A car will always be kept under steam at the depot ready to take intending buyers out for a trial trip.

CORRESPONDENCE.

A SUGGESTED MOTOR-CAR SERVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you give me room in your columns to suggest to those of your readers interested in promoting electric tram or motor companies that there appears to be an opening for some such communication between the city of Gloucester and Cheltenham—to start from the present tram line at the Gloucester end of the Cheltenham road, and connect with the electric tram line, now in process of completion, which is to connect the two railway stations at Cheltenham, and then proceed to the village of Cleave. The road between Gloucester and Cheltenham is level and of good width, goes through pretty country, and there is a fair traffic between the cathedral city and the town. There is plenty of building land *en route* not yet utilised; and in dry weather such a connection would probably evolve a good deal of holiday traffic. At any rate it is worth investigation.—Yours truly,

A FREQUENT VISITOR.

A PERFECT TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the correspondence on "A Perfect Tricycle," of March 23rd last, Mr. Maudslay states that "a motor which has to work downhill is an absurdity." It seems to me that one which does so would cool down quicker than a free engine. In running down a short but steep hill the free engine would be thrown out of gear and a certain amount of air would be expelled from the radiating flanges. Now take the case of a motor trike with engine always in gear with the road wheels. On going down a hill similar to the above the compression tap would be opened and fresh air sucked in, which would cool the inside cylinder and be discharged out again through the tap and exhaust box. Not only that, but the air or carburetting lever would be opened, admitting air to both inlet and exhaust valves. In the free engine only the outside would be cooled but the other would be cooled inside and out. I may say that I am referring to air-cooled engines only. Trusting to have a reply from some of your readers.—Yours truly,

A. MOORE.

RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is somewhat surprising in view of the great efforts now being made on the Continent to obtain extreme speeds that more attempts have not been made to utilise steam as a source of power, the Gardner-Serpollet car being probably the only steam car which has been thoroughly worked out on this side the Atlantic, and this car, even with a flash water-tube generator of comparatively heavy design, owing to thickness of tubes, is able to beat all competitors with internal combustion motors.

I notice in Mr. Mark Mayhew's notes in your last issue that he refers particularly to the efforts now being made to reduce the weight of cars and machinery in order to increase speed, and he gives the actual weight of the latest Panhard car as 24½ cwt., the motors weighing 25½ cwt., with *legend* brake horse-power of 65, and probably only about 60 per cent. of this power is transmitted to the driving wheels.

I would point out that for this weight (25½ cwt.), and using a modern water-tube boiler and triple or quadruple expansion engine, it would be quite easy to obtain 150 brake horse-power without doing anything extraordinary or introducing any novelties or absurd complications of any description. The boiler could be fired by gasoline or petrol controlled by an ordinary diaphragm regulator, and the feed-water could be controlled by various automatic devices without the aid of any floats, the Yarrow system being one of the simplest, and proved quite reliable under all sorts of trying conditions. Nothing could be much worse for testing an automatic feed in a water-tube boiler than to be fitted in a small torpedo boat, and then run in a lumpy seaway; such conditions would never be approached on any road. An air condenser of similar design but rather larger than those now in use on the explosion cars would be required, and a fan to circulate the air when running at

slow speeds up hill. This fan is already fitted on some of the large explosion cars. The engines could be coupled direct to driving axle, the axle being split and an engine driving each wheel independently to avoid a differential. No change gear would be required, any increased effort for hill work could be obtained by admitting high-pressure steam direct in the usual way to the intermediate and low pressure cylinders. If a quadruple expansion engine were used, it could be arranged so that the high and first intermediate cylinders drove one driving wheel whilst the second intermediate and low pressure cylinders drove the other wheel, or they could be driven as independent compound engines, and this change would of course be made, *not* by gearing, but by simply altering the steam and exhaust connections, *i.e.*, opening or shutting a valve. Such a car as indicated above would have power enough to drive at any speed which a "racing fiend" dare run it on a road. It would be practically silent, and the engines could be so nearly balanced that vibration would not be felt. The fuel consumption would, I am convinced, compare favourably with any high powered car now in use on account of the great gain in transmission due to entire absence of gearing.—Yours faithfully,

STEAM.

THE ASTER AND DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. E. H. Livesay's letter in your issue of April 27th, he says: "There is one advantage which I do not think has been touched on, which is, that the De Dion engine always seems to me to run with greater regularity and steadiness at a very low rate of speed. This is, I think, due to the fact that the contact on the De Dion is vibratory and at a low speed the trembler has plenty of time to vibrate on the contact screw, giving a stream of sparks at the plug however slowly the engine is going."

Now consider the first spark. It raises a number of molecules of oxygen and petrol vapour to a temperature high enough to make them combine, which ignites the rest of the charge.

Now consider the next spark. It may occur before the explosion is complete, but it will spark through an *envelope of gas* composed of nitrogen, carbon-dioxide, water-vapour, etc., and therefore does not quicken the ignition of the charge and thereby increase the force of the explosion. The fact that one spark does ignite the mixture is shown by the Aster motor itself. Therefore I see no use of a series of sparks for igniting the mixture, as all of them, excepting the first, are wasted; thus a considerable amount of costly electrical energy is thereby thrown away.—Yours truly,

D. J. W. BAXTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Canning's letter in last week's issue, I accept his statement that he is entirely disinterested and not connected with the trade, but at the same time I do not see why that point should enter into a discussion on the merits of the Aster and De Dion motors. My suggestion was not that Mr. Canning preferred the Aster motor because he was interested in its manufacture or sale, but that possibly his own experience had been somewhat better than the average user's, and, being an enthusiast, he had allowed his judgment to be warped accordingly.

I should very much like Mr. Canning to show me an Aster motor working with perfect regularity at below 200 revolutions a minute. As Mr. Canning does not deal with any of the points raised by me in my letter, I take it that he does not dispute the correctness of same. I am obliged to him, however, for his remarks in regard to racing. I did not suggest that there had ever been any races in England, and I also did not mean to imply that it would be a very simple matter for Mr. Canning or anyone else to run round a track practically at any speed, and I did not suggest that a performance on the track was of any value at all. I have, however, my own opinion in regard to this, and the fact that Mr. Canning expresses contempt for performances of this description does not affect that opinion in any way, and no doubt there are a number of other readers of your paper who feel likewise. As, however, I did not remark anything about track racing, and as I have also taken part in road races in France,

perhaps, as I before remarked, my opinion as to what is a good and what is a bad motor may be accepted.

It is ridiculous of Mr. Canning to point to the Nice-Salon-Nice race—an isolated instance of an Aster success—and I would refer Mr. Canning to the results of all the big motor races of the past two or three years, when it will be found in the motor-cycle section that the De Dion machines have usually been first, second, and third. It is unnecessary to enter into a controversy on this point, but as the facts as stated by Mr. Canning are so inaccurate I think it only right that they should be corrected.—
Yours truly, CHAS. JARROTT.

PETROL AT BRIGHTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be much obliged if any of your readers can inform me where to obtain petrol in Brighton on Sundays. I have the book called "Where to Obtain Petrol," which contains several addresses in Brighton. Last Sunday, however, I called at each of these addresses and found the shops closed. I also discovered that the proprietors were not living on the premises, and that there was no notice posted at the shop stating where they resided. After this experience I strongly advise your readers to make arrangements for petrol if they intend visiting Brighton on Sundays.—Yours truly, WALTER POINTER.

TRICYCLES AND TRAILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If ever a case merited the attention of the Vehicle Users' Defence Association it is the one reported on page 132 of your last issue. By what process of reasoning do the Chertsey magistrates arrive at the conclusion that a tricycle and trailer are two vehicles when the Inland Revenue recognise them as one, and had, according to the defendant's evidence, accepted payment of licence on a "four or more wheeled carriage"? Surely this is a case for appeal, as I am sure it has been decided that a tricycle and trailer ranks as one carriage and is liable to the £2 2s. tax. Perhaps fellow-sufferers from this kind of persecution would let us hear from them as to what decision the justices arrived at in their own particular cases? "INDIGNANT."

SPARKING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Aster's" letter in your last issue about his motor, the fault is probably in the carburettor which is too small for the horse-power of the motor. If it is a Longuemare, a larger spray might overcome this difficulty. In all probability the motor is using up more gas than the carburettor can make.—
Yours faithfully, J. CUSINS-NIXON.

MOTOR-CARS FOR LIGHT RAILWAYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A paragraph in your issue of the 13th inst., in reference to motor-cars to run on railway lines, has just been brought to my notice. I may say that Messrs. De Dion Bouton, of Puteaux, are at the present time making vehicles especially for this purpose. The details are not yet quite complete, but we shall be pleased to correspond with anyone who is especially interested in the question, and to give them any information possible up to the present and advise them as soon as the car is ready for trial purposes. We may say that we have a car on order, and as soon as one is completed by Messrs. De Dion it will be delivered to us.—Yours truly, DE DION BOUTON, LTD.

WALTER MUNN.

MOTOR-BICYCLE TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We were very disappointed to find that the Singer motor-bicycle did not put in an appearance at the trials at the Crystal Palace, on Saturday last, as we are anxious to compare the performance of this machine with the Werner. We have not yet had an opportunity of testing the Werner against the Singer, and as there is a great amount of controversy on the question of

the comparative merits of these two types of machines, we shall be very glad if the Singer Company will suggest to your good self or to us a trial of any kind in which they would be prepared to run the Singer machine against the Werner.—Yours faithfully The Motor Manufacturing Company, Limited,

ALFRED BURGESS, Secretary.

A MOTOR-BICYCLE FAULT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the paragraph in your last issue the writer himself seems to be at fault. My experience is that a motor-bicycle can be taken exactly where an ordinary safety can, and when one comes to think of it the old bike of '90 used to weigh as much as the up-to-date Werner; and we didn't grumble much when we had to three-flit it. Of course, one does not for fun place the motor-cycle on its side, but it can be done if one wishes and no harm is done. Where's the grumble?—Yours faithfully, F. GUY LEWIN.

DAMAGES WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst riding a motor-tricycle from Newport Pagnell to Wolverton the other day I was mounting a hill when two sheep rushed out of a field and came full tilt into my machine. The impact was so great that the tricycle was turned right over; the two side wheels were smashed, tubes were broken, and I was shot on to some barbed wire, receiving numerous cuts and bruises all over my body. Could any of your readers tell me the best way to obtain damages?—Yours truly,

FELLOW MOTORIST.

THE ENGLISH MOTOR CLUB'S CONTROL CONTEST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While at the Crystal Palace Competitions last Saturday, I was puzzled on studying the programme and making inquiries to find out the utility of competitions such as those of Class G, Class H, and the 200 yards speed contest. I should like to ask what it is intended to prove by such competitions?

In Class G, I noticed there were the following entries:—12, 16, 24 h.p.; in Class H, 12, 20, 24, and 10 h.p.; in the Speed Contest, 1½, 10, 3½, 6, 4½, 4, 8, and 9 h.p. Now, these vehicles each of different horse-power, unequal in construction, and carry-different weights, were placed in equal competition, and I could not find that any system of handicapping had been arranged. I have had some experience in racing competitions, but this is about the first time I have ever seen such a mixture put together upon an equal basis.

If this is the form in which motor carriage competitions are to be run, I should strongly recommend that they be severely left alone by every owner or manufacturer of a motor carriage.—
Yours truly, JOHN H. GRETTON.

THE British Motor Traction Company, Ltd., write: Referring to the letter entitled "A Motorist's Quandary," in your issue of the 20th ult., signed A. Kent, in which this gentleman states that there seems a great deal of uncertainty as to what is a properly licensed engine or not, we as owners of the principal motor patents in this country can very easily make this matter clear to him. Any engine or motor carriage which he wishes to buy, if he will communicate with us, we will tell him whether it is properly licensed under our patents or not. If it is properly licensed and a motor made under our patents, we will give him a legal indemnity to protect him against any attack from any other firm. This should remove all his troubles and get over every difficulty he mentions.

THE *Motor World*, of New York, has started a movement in favour of a national league, union, or association of both individuals and clubs, to which all reputable automobilists in the United States are eligible on the payment of a popular fee and on which they may lean and feel a sense of security; an organisation having capable sub-heads in the several States or sections, with authority to act independently, promptly, and energetically as occasion arises or as opportunity presents.

CONTINENTAL NOTES.

BY "AUTOMAN."

AUTOMOBILISM is going to have a statue erected in its honour. What other industry could have hoped, in the first ten years of its real existence, to have attracted sufficient public interest and assumed the requisite national importance to be recorded in marble or bronze? Paris is to

Avenue du Bois and Avenue de la Grande Armée. The former is paved with macadam, and is in very bad condition, and nearly all motorists choose the latter, so that in starting and in returning they will pass by the statue of the man who was certainly the master mind and the inaugurator of the great petrol motor-car industry.

THE use of the motor-car for agricultural purposes is being

M. GASTON GUDERS STARTING FROM BRUSSELS ON HIS 12 H.P. PANHARD.

BARON DE CRAWHEZ'S 28 H.P. PANHARD—JUST BEFORE THE RACE.

have a statue of Levassor erected by public subscription, and a site most suited to the circumstances has been chosen in the little grass-covered island at the entrance to the Bois de Boulogne, just by the Porte Maillot. Ninety per cent. of the Paris automobilists when they want a spin go into or pass through the

studied in France, where an inventor is at work, I understand, on an automobile reaping machine, with a 12 h.p. petrol motor. It can be seen at a glance that this will have many advantages to the farmer over the reaping machine drawn by horses. Speed is a great gain to the agriculturist who wants to make the

M. J. VAN STAPPEN ON HIS 5 H.P. BUCHET CAR.

M. J. MORTNES D'OESTERWYCK ON HIS 6 H.P. BELGIAN DAIMLER.

Bois de Boulogne, which, whilst it affords in itself a great charm and variety to the explorer who hunts out the beauties of its numerous by-paths, is also the main road to Versailles, St. Germain, and many other world-famed tourist resorts. To enter the Bois from Paris there are two principal arteries, viz.,

most of a spell of fine weather to get in his harvest, for with horses he is limited to a walking pace, whereas with a motor he can increase his speed to a very large extent. Then, again, he needs in any case either to have a mechanic or to have some mechanical knowledge himself in order to be able to keep a

reaping machine in order. A petrol motor will therefore come easy to him, and not cause him any additional expense, and will not want feeding during the long months when perforce it must lie idle. The farmer who takes advantage thus of the automobile will soon learn to look with more favour on us as we buzz by him on the road.

ACTORS and actresses took to motors quite in the early stages of their development, but M. Huguenet, the Paris artist, who has just been engaged by the "Galeries" Theatre, in Brussels, to play in a piece called "Veine," is the first that I have heard of to "tour" in his car. M. Huguenet travelled from Paris to Brussels in his 6 h.p. Darracq. He left Paris on Sunday morning, and arrived in Brussels, without accident of any kind, on Monday evening. He is delighted with his trip, which he accomplished at an average speed of $18\frac{1}{2}$ miles per hour, enjoying meanwhile the beauties of the scenery.

I HEAR that Mors is preparing some new cars for this year's races, and I am told that they are to be of 70 brake h.p., about the same wheel base as the 16 h.p., but slightly wider. There are to be four cylinders, and the frame being rather low, the engine looks enormous, and seems to dominate the car. The fourth speed is to be 93 miles per hour, and I understand that already $29\frac{3}{4}$ miles have been accomplished in a private trial in twenty minutes, which makes a speed of nearly 90 miles per hour.

ONE never knows what may happen, and if the Austrian automobilist who met with an accident a short time ago had a prejudice against steam-cars, lest he should be blown up, and therefore bought a petrol car, it only proves again that one never knows. It was a De Dion-Bouton voiturette, and the weather in Vienna was very cold. He was going through Vienna, when suddenly there was a violent explosion, clouds of steam, and his motor broken in pieces. It looked as if the cylinder had given way, and was unable to resist the explosive mixture, but on closer examination it was discovered that his circulating pump was stopped up, and that the cold and the speed of travelling had frozen up his radiator and pipes, leaving his cylinder jacket full of water, with its passage blocked at each end by solid ice. In fact, he had a boiler without a safety-valve. The result was obvious. The heat of the constantly repeated explosions in the cylinder soon turned his water into steam, and up and up went the pressure until the water jacket burst.

A KILOMETRE speed competition with a flying start took place near Antwerp on the 21st ult., in glorious weather. (See illustrations on page 141). The start was advertised for fourteen o'clock, as it is called in the kingdom of Belgium, where the twenty-four-hour system was adopted some years ago. During the morning the streets of the old town of Antwerp were very busy with motor-cars of all kinds and descriptions buzzing to and fro, and preparing for the contest. I noticed quite a contingent from the A.C.B. lunching at Bertrand's famous restaurant on the Place de Meir. The trials took place at Vieux-Dieu, outside the fortifications, on a military road between two forts. The road is not very wide, but quite straight and level, and paved with square sets, fairly smooth, and in good condition, the sets having a great advantage to the spectator, as far as the absence of dust is concerned. The best times were the following:—

1. A. Joostan's electric car at a speed of $43\frac{3}{4}$ miles per hour.
2. P. Wilford's 16 h.p. Peugeot at a speed of $41\frac{1}{4}$ miles per hour.
3. Baron de Crawhez's 28 h.p. Panhard at a speed of $40\frac{1}{4}$ miles per hour.
4. Miesse's steam car at a speed of $35\frac{1}{4}$ miles per hour.
5. De T'Serclaes' 6 h.p. tricycle at a speed of $33\frac{3}{4}$ miles per hour.

The great interest centred, of course, on the Baron de Crawhez and his new 28 h.p. Panhard, of which great things were expected, and it was a surprise to everyone to see him beaten by a 16 h.p. Peugeot, which had been driven over from Paris the day before in order to compete. The Baron has written to the papers to protest that his time must have been badly taken, and that his car can do fifty-two miles per hour. M. Wilford, with his Peugeot, has replied challenging the Baron to run the race once again any time he likes, the stakes to consist of "glory." My Kodak, however, throws light on the subject, and proves beyond question that the relative speeds are, at any rate, correct, for the shutter of my camera is not quick enough to take clearly a speed of forty miles per hour, and, therefore, in some dozen pictures which I took exactly at the same spot the distinctness of each varies absolutely with the speeds recorded.

THE Course du Catalogue organised by *La France Automobile* took place last Sunday on a four-sided course from Melun to Nangis and Valence, and round again to Melun. Once round, or $47\frac{1}{2}$ miles, for the light cars, and twice round, or 95 miles, for the big cars. The following were the winners:—

Class 1. Cars selling at less than £160, without bodies, Demester on a Gladiator, speed $36\frac{1}{4}$ miles per hour.

Class 2. Cars selling at between £160 and £320, without bodies, Edmond on a Darracq, speed 38 miles per hour.

Class 3. Cars selling at between £320 and £480, without bodies, Cuenod on a G. Richard, speed $25\frac{1}{2}$ miles per hour.

Class 4. No starters.

Class 5. Cars selling at more than £640, without bodies, De Champrobert on a Bolide, speed $39\frac{1}{8}$ miles per hour.

Class 6. Electric cars, Garcin on a B.G.S., speed $14\frac{7}{8}$ miles per hour.

The net result is a victory for the small cars, which nearly equal the speed of the big-powered cars at an infinitely smaller cost. H. de Rothschild went over the course for a wager on his Mercedes, averaging only $43\frac{1}{2}$ miles per hour.

ON Sunday, May 19th, the A.C.B. will hold a kilometre speed competition at Diegheim, on the road to Haecht, near Brussels. This is the most important Belgian event, and it is anticipated that some of the "high flyers" preparing for the Paris-Berlin race will appear there for a preliminary canter.

I HAD a glimpse the other day of the motor-car belonging to King Leopold as it was standing outside the works of one of the leading firms of motor-car builders in Brussels. It is certainly a splendid vehicle. It is really a capacious *coupe* fitted on to the ordinary Panhard and Levassor frame, with the driver on the front seat. The fittings are very fine, and the satin lining and polished brass stand out against the dark green carriage work, giving the appearance of a very stylish turn-out. I noticed, however, that the car is not numbered, and I wondered if the King were specially exempted from this regulation.

MICHELIN, in his "Monday," in the *Auto-Velo*, tells why his inner tubes are always red. It is because he uses the best Para rubber combined with the sulphate of antimony, which renders it at once supple and durable. His outer covers, on the contrary, are light in colour because he employs a stronger rubber, which better resists the road friction.

THE Paris Municipal Council has conceded a site at the Porte Maillot entrance to the Bois de Boulogne for the monument to the late M. Levassor.

UNDER the title of the Bowden Brake Company, Limited, a company has been registered with a capital of £50,000 to adopt an agreement with E. Bowden's Patent Syndicate, Limited, to manufacture and deal in the Bowden brake, and any other brakes for cycles and motor-cars; and to carry on business as carriage builders and merchants, tyre and brake makers, engineers, etc.

THE "HUDD" PETROLEUM-SPIRIT MOTOR.

AN attempt to produce a motor as nearly vibrationless as is possible is that of the "Hudd" Syndicate, some of whose accessories we have lately described and illustrated. It has no striking departure from principle, but, as shown to our representative last week, it has several very noteworthy features and novel design. The inventor has carefully studied the question of vibration and aimed at minimising it as far as possible. To do this he has wisely provided for the vibration from the force of the explosions as well as for the balance of the moving parts. It is claimed that both explosions and moving parts are

FIG. 1.

perfectly balanced and a true vibrationless engine produced. As will be seen from the illustrations, two cylinders are used and placed directly in line with each other. Each cylinder is 3½ in. bore by 3 in. stroke, the two together developing 5 h.p. and working at a speed of 1,000 revolutions per minute. The extreme measurements are 30 in. by 16 in. by 10 in. deep, the whole being very compact and allowing for any type of body to be fitted, and leaving ample room for the passengers.

Each cylinder drives its own crank with a flywheel for each. These are geared on to the driving axle so that the force of the explosions does not travel on to the gearing, thus absorbing the impulses of the explosions and avoiding loss through friction. Every part moves in opposite directions, pistons, cranks, and connecting rods, so as to provide for the shock of the thrust of the explosions against the cylinder head and to provide against the vibration of the moving parts. Even the pendulum-like action of the cranks, rotating and swinging before each other, is used

FIG. 2.

to minimise vibration. A further effort in this direction is a small-bore tube from one combustion chamber to the other used to equalise the compression and therefore to also equalise the explosion. In the sectional drawing the two pistons AA are connected by similar connecting rods BB to the two cranks CC on separate spindles DD. A gear wheel E behind each crank gears into another gear wheel F on a spindle H from which the power is taken and by which the exhaust valves are driven. The bearings of the spindles DD are brought up close to the cranks so that the gear wheels are over the ends of the bearings. The

fly-wheels GG are fixed at the ends of the spindles DD opposite the cranks and serve only as reservoirs of energy, absorbing the energy of the explosions and relieving the gears from the shocks. It will be seen that the similar moving parts on each side of the motor always move in opposite directions. The carburettor employed is of the constant-level "spray" type. It consists of a T casing, the two upper members connecting with the induction valves of the cylinders and the lower members with an air heater (not shown in the illustrations) fixed to one exhaust branch. At a constriction in the lower member of the T casing a small orifice communicates with the little reservoir of oil seen in front of the carburettor. There is no projecting jet, the hole being flush with the inner surface of the carburettor. An overflow pipe is provided in this reservoir to keep the level constant, a small pump continually supplying more petrol than required. On the suction stroke a fine jet of petrol emerges from the small orifice mentioned and mixes with the warm air passing. A valve above the carburettor serves to control the speed of the engine by cutting out the mixture directly or indirectly by a governor. The ignition gear consists of a centrifugal governor which moves the cam controlling the ignition on the shaft H through an angle proportionate to the speed.

The transmission consists entirely of gearing fixed on a bracket fastened to the foot J of the motor, and parallel to the shaft A the shaft driving the hand wheels of the car is fixed; this shaft carries gears which are driven by other gears in turn to this parallel shaft and provides three speeds forward and a reverse. To make control and driving easy there will only be one handle, the ignition gear which controls the speed described above, and the starting valve, referred to in a recent issue, being used.

FIG. 3.

The Hudd motor is made by the Hudd Syndicate, of 27, Farnival Street, E.C. We understand that it is probable that for the present the Syndicate will supply the engines for those who desire to build their own cars.

EARL RUSSELL was the chief witness in a case at Alton Petty Sessions on Tuesday. The earl was driving his motor car between Alton and Farnham, when a van, unattended, stopped his car. He communicated with the Chief Constable of Hampshire, with the result that the defendant, a grocer, was summoned and fined five shillings.

We learn that Mr. Harrison Benn, of the firm of Messrs. Joseph Benn and Sons, Bradford, and vice-president of the Yorkshire Automobile Club, after visiting Paris to inspect all the leading systems of French electrical vehicles, has just placed an order with Messrs. Shippey Bros., Ltd., for an electrical landau and a 10 h.p. electric sporting dog-cart for use on his estates in Devonshire.

THE Rubber Tire Company requiring for their own use a more extensive place of business, the Clipper Pneumatic Tire Company, who have hitherto occupied a portion of their premises in Aston Cross, have been obliged to move their head office and factory. The Clipper Company have therefore acquired new premises in Alma Street, Coventry, lately occupied by the Dunlop Pneumatic Tire Company, which will be their head office in future. They are, however, still retaining a portion of the Aston Cross building as the Birmingham dépôt for their tires.

JOTTINGS BY A WORLDLING.

I DROVE down the Portsmouth Road on Sunday on a May-fair voiturette, which, by the way, went excessively well, and I was surprised at the number of cars I saw. There was quite an automobile meeting at the Angel Inn, Thames Ditton, at about seven o'clock. Besides ourselves there were two tricycles, a Renault, and a big 8 h.p. Panhard, with two ladies on board whom I judged to be French from their very elaborate *chauffeuse* costumes. We also passed two Peugeots, a quadricycle *en panne*, several Benzs and De Dions, two Daimlers, a Stanley steamer, and half a dozen tricycles.

I HEAR a new American steam-car, the Kidder, very well spoken of. I do not think there are any in this country yet, but one is being sent over for the use of Mr. Charles Colby, a director of the manufacturing company, who has taken a house in London.

A MOST delightful and economical way of spending the summer would be to drive down from Dieppe through Paris, Strassburg and Offenburg to the Black Forest, and to make some country *wirthschaft* the centre of expeditions to such places as Baden-Baden, Badenweiler, Altbreisach, and even Bâle and Neuhausen. There is an excellent inn called the Kyburg, in the Günthersthal, one of the first valleys on the Freiburg side. Pension, about 6s. a day; excellent "open" wine and good cooking, electric light, a lovely garden, and a trout-stream. The proprietor speaks English, and understands our habits and wants. In Freiburg itself there is, I believe, a motor-car club called the Breisgauer Automobil Verein. One can have a splendid drive back down the Rhine to Cologne, Aix-la-Chapelle, Liège, Brussels, and Antwerp; or one might do it the other way, going to Aix from London in time to see the second stage of the Paris-Berlin race. As all the world knows, the Grand Monarque is the place to stop at in Charlemagne's city. The other hotels on the route are: the Grand at Antwerp, the Grand (with a courtyard for one's car) at Brussels, the Suède at Liège, the Dom or the Nord at Cologne, the Royal at Bonn, the Géant at Coblenz, the Germania at Karlsruhe, the Victoria at Baden-Baden, the station hotel, the name of which I forget, at Offenburg, the Zähringerhof at Freiburg, the Ville de Paris at Strassburg, the France at Nancy, the Meunier at Chalons, the Angleterre at Rouen, and the Grand at Dieppe. I have found all these hotels very comfortable, and can recommend them from personal experience.

MRS. KENNARD was, I think, the first lady novelist to write of the joys of automobilism, but several others have followed her lead, among them being Mrs. C. N. Williamson, who accompanied her husband on part of a long tour which he has recently made round France into Italy. Mrs. Williamson has introduced the motor-car into more than one of her novels, and she told me the other day that she did not think much of life without one.

AMONG recent experiments made by the French War Office has been that of fitting small bakeries on to automobiles that can follow an army at about six miles an hour. It was, I am told, very satisfactory, and the Government intend ordering a large number of these machines from Monsieur Schweitzer, whose bread-making apparatus was used. There is something so aggressively modern about the idea that the good people in Pall Mall will probably not dare to even look at a specification for a decade or so.

It may be a chestnut, but it is amusing.

Scene: Between London and Richmond. Irascible sportsman in a phaeton behind two fresh horses that are expressing their disapproval of a passing motor-car somewhat boisterously: "Why the — don't you burn the — thing?"

Chauffeur (blandly). If you can't drive, why did you hire the trap?"

Collapse of I. S.

I HAVE always held that the motor-car industry in this country would benefit greatly by some such keen form of competition as is the outcome of the racing in France. It will be long before the local authorities are convinced that a few wayfarers on our great roads must be inconvenienced for about a hundred hours in a year that a great industry may thrive. Races between 4.30 and 7.30 a.m. on the Bath and Portsmouth roads might slightly affect a few unimportant market folk, but they would be of incalculable value to thousands of people dealing with millions of capital. Bumble will, however, not appreciate this for many years to come. It is, therefore, regrettable that a good race-course for motor-cars cannot be established. I, for one, believe it would pay, as one might reasonably expect big gates for such an exciting sport. *Apropos*, I heard the other day that a company is being formed to make a race-course at Wembley Park, and that Mr. Roger Wallace, K.C., has been approached to accept its chairmanship. It would not cost much—say £10,000—to make a good motor-car *piste* round this course, and I am sure there are enough sportsmen interested in automobilism to guarantee four per cent. on any outlay that the company might make with this object. Mr. Wallace would be doing much for the industry if he were to suggest this to his fellow-directors.

I HEAR that a *garage* is to be opened shortly on the Bayswater Road where people who have not stable accommodation can store their cars at a very small monthly charge. Each car will have a separate box, to which the owner will have a key. There will be a workshop attached to the *garage*. This should prove a boon to many people.

TO-DAY (Saturday) the members of the Irish Automobile Club will hold a run from Dublin to Blessington, seventeen miles out.

AT a meeting of the Chelsea Town Council, the Surveyor reported that there had been four accidents with the municipal motor-vans, a sum of £7 8s. being paid in compensation.

WHEN in at the Daimler Motor-Company's London *dépôt* the other day we saw a handsome 6 h.p. tonneau, finished in black and green, which was just about to be despatched to the Marquis of Winchester.

A USEFUL little device in the form of an apparatus for testing ignition accumulators without using a voltmeter has just been brought out by the Bristol Electric Safety Lamp Works, of Great Smith Street, Westminster, S.W.

IN writing to Messrs. Salisbury and Son with regard to the Salisbury Bleriot acetylene motor lamp, Frank Morriss, of King's Lynn, expresses the greatest satisfaction with it. The lamp sends out a bright beam of light of from sixty to eighty yards in length, thoroughly lighting up the road in front.

THE Automobile Club is preparing a list of electric charging stations within a radius of ten miles of Charing Cross. Members who can supply such information are requested to communicate with the Club Secretary and, if possible, to state whether 115 volts are obtainable, what is the price charged for current, and during what hours the station is not available for the charging of electric vehicles.

THE F. O. Bailey Carriage Company, of Portland, Me., is placing on the market a torch heater for steam motor carriages. It consists of an iron trough fitted to a pointed steel rod. In using the heater it is held under the torch valve of the carriage and a small amount of petrol is allowed to run into it. The torch is placed over the heater and the petrol is ignited with a match. When the petrol is consumed the torch is heated to the right point.

A NEW aluminium alloy of the name of "macadamite" has been introduced in America, and is soon to be placed on the market. The standard composition for castings contains 70 per cent. by weight of aluminium, 26 per cent. of zinc, and 4 per cent. of copper. The alloy has a specific gravity of 3.31, and the tensile strength is claimed to be from 40,000lb. to 60,000lb. per square inch. The lightness of this new alloy, combined with its strength, will, undoubtedly, render it of great value in the construction of certain parts of motor-cars.

THE MOTOR-CAR EXHIBITION.

A FORECAST.

SO far as automobilism in this country is concerned, the century opens well. Mr. Arthur Balfour, the Leader of the House of Commons, has welcomed the motor-car as a practical solvent of some social ills, and the Automobile Club's Motor-Car Exhibition at the Agricultural Hall, Islington, will afford convincing testimony as to the feasibility of his ideas with regard to locomotion on common roads in the future. The forthcoming event will demonstrate an advance in the manufacture of motor-vehicles that is as far removed from the endeavours of the first years of the last decade of the Nineteenth Century as the initial efforts of Stephenson to the railway locomotives of to-day. This may seem an exaggeration; but a glance round the Agricultural Hall on any day next week will prove conclusively that vast improvements have been made, for the manufacturers are getting into the right direction with regard to future developments.

Every kind of car (petrol, steam and electrical) will be shown, and many nations will be represented. Not only will British manufacturers make a creditable display, but the best types of French, Belgian, German, American and Canadian vehicles will be exhibited to afford a comparison of our own performances with those of foreign countries and our own Colonies. It may seem that a display of vehicles such as this would be a monotonous collection; but variety and interest will abound on nearly every stand. An electric Victoriette similar to one that has been sent to Sandringham for the Queen, will be shewn, and the great motor-caravan of Messrs. Turgan and Foy, which recently created something like a sensation in Algeria, will be on view, a novel adaptation of mechanical power on roads, which offers a new experience to the jaded man of wealth able to afford a lazy holiday on the go-as-you-please principle. There will also be one or two of the 50 h.p. Napiers, and probably the Motor Manufacturing Company's car entered for the Gordon-Bennett race, while much attention is likely to be directed to the identical Gardner-Serpollet car which won the Rothschild Cup at Nice, and which travelled at the mean speed of sixty-three miles per hour. The presence of such exhibits as these will appeal to the interest of the public who are only cursorily concerned with automobilism; to the people who are more keenly inclined towards the new movement there will be scores of new ideas, applications, and suggestions—all of interest and many of value. Hence the necessity of these exhibitions to keep motorists *au courant* with the new developments that are being made in the industry throughout the world.

As to the success of the Exhibition there is not the shadow of a doubt. The whole of the ground floor will be occupied, and the adjoining halls will also be filled for the first time. Mr. Charles Cordingley, whose business management of the exhibition has resulted in such a fine show, will have his offices in the same place as before, and has arranged a special room, under the control of Mr. W. J. Peall, for members of the Automobile Club, in which a billiard table will be fitted. At dinner every evening music will be provided, and on Wednesday Sir Francis Jeune will probably preside over the dinner of the Automobile Club. Last year a similar gathering, under his genial presidency, was one of the social successes of the week, and the forthcoming dinner will probably be an advance on its predecessor. In the great demonstrating arena opportunity will be given for the public to have rides in motor-vehicles, and there under the direction of Mr. Basil Joy, a past president of the Junior Society of Engineers, manufacturers will demonstrate the easy running of modern automobiles. To those of an artistic temperament, and whose education with regard to the technicalities of the motor-car has been neglected, the Poster Exhibition will present automobilism in a new and favourable light. There will be a large and comprehensive display of the posters issued by the leading Continental firms. This is a branch of art that our manufacturers have not largely cultivated, and both designers

and the trade will glean many appropriate ideas in this section of the exhibition.

Anticipating somewhat as to what will be the leading feature of the Exhibition, we may mention that several evidences will be present to prove that British manufacturers have not been idle since the last exhibition. The Daimler Company will show their 4½ h.p. Kimberley car, a 9 h.p. Marseilles *tonneau* car, a 6 h.p. wagonette, and their standard vehicles which early popularity has made familiar to motorists. Several good types of vehicles designed for hotel work and public service will be exhibited by the Motor Manufacturing Company, who will complete a varied exhibition with the M.M.C. *voiturette* and other light vehicles. Nine h.p. Napier cars, to say nothing of the 50 h.p. cars, developing 70 h.p. on the brake, will also be shown, while other attractions of British manufacturers will include a 6 h.p. double-cylindered Star car; a Hallamshire light car built for use in hilly districts; the "Progress" car, which will pass through a gateway 3ft. 7in. in width and yet has enough room to seat two persons side by side; a New Orleans three-seated car; *voiturettes* fitted with 3½ and 6 h.p. "Imperial" water-cooled motors, the latter having a *tonneau* body; the "Humber" four-seated car with 4½ h.p. De Dion motor; a new two-seated car by the Metropolitan Motor Manufacturing Company; the "Swift" *voiturette* with its 4½ h.p. water-cooled engine; a Wolseley 10 h.p. car with *tonneau* body and a two-cylinder horizontal motor; a Marshall 4 h.p. *voiturette* in which the belts have been dispensed with, and the Belsize car, which is also gear driven. A new steam car of British make, known as the Simpson, will naturally attract much attention. This is built in two sizes, two-seated and four-seated. A flash type boiler is employed. The number of heavy vehicles will not be large, but Bayley's steam trolley to carry four tons will be a worthy representative of a section of the industry in which Great Britain leads.

From America several new cars are promised, including the "Reading" steam car and the Petromobile. This latter has an engine of 6 h.p. and the boiler has 370 tubes of standard gauge, giving a large heating surface.

Among French cars that are new to this country will be the Amedée Bollée two-cylinder car, the motor of which works with either petrol or alcohol; and the Crouan 6 h.p. light car with five speeds forward and a reverse motion. The Bardon car will also be shown for the first time at any English exhibition. Other notable exhibits will include a 8 h.p. Darracq phaeton, the "Ader" *voiturette*, a 3½ h.p. Delin *voiturette*, the "Teras" *char-a-banc*, on the Gobron Brillié system, the 6 h.p. "Vehel" *tonneau* car, a 10 h.p. Mors car with *tonneau* body, a Brown motor-bicycle, and several electrical cars. In this connection, all interested in motoring will be glad to hear that the great French house of Panhard and Levassor will send several of their latest cars, including 5, 7, 8, and 16 h.p. vehicles.

In addition to having the finest collection of motor-vehicles ever seen in any part of the British Empire, the exhibition will also contain a splendid show of accessories, tires and other indispensable adjuncts. Here mention may be made of Bowden's patent wire mechanism fitted to motor-cars, by means of which the change gear, sparking advance, throttle and regulator are all actuated. The Cranford variable-speed gear, which is claimed to have ten distinct advantages, will be on view. In tires there will be the usual complete selection, added to by the "Williams" tire, which has an encircling cord so arranged as to give great power of resisting side thrust.

In this brief forecast we have not attempted to do more than mention some of the interesting exhibits that will draw the Automobile world to Islington during the next few days. In subsequent issues the *Motor-Car Journal* will publish a full and complete report of the various stands, particularising their novelties and detailing their main points. But the foregoing notes will indicate the varied and important character of the Exhibition. It is not for us to sing the praises of the Exhibition; but we are confident that the verdict will be, when the exhibition closes its doors on the 11th inst., that the display exceeds the anticipations of the most sanguine and has already grown to

International proportions. Manufacturers abroad have recognised the expansion of the British market and our own are rightfully anxious to share with the general prosperity. These and other facts will be apparent from the most cursory glance at the Exhibition. It will form a great means of publicity to the industry and, in educating the public to an appreciation of the automobile, will do much to hasten the disappearance of the fast dying prejudice against the inevitable. For that is what the motor-car has come to be.

THE DUBRULLE MULTIPLE LUBRICATOR.

A NEW multiple lubricator, in which the feed is effected by the exhaust pressure of the engine, has recently been brought out in France. The apparatus consists of a metallic recipient A (see illustration), serving as an oil reservoir, and a distributing pipe B by which the oil is led to all the sight-feed tubes with which the device is provided. C is a column serving to maintain the distributing pipe in place, and also containing a valve D by which any excess of pressure is relieved. E is the glass tube through which the feed of the oil can be observed. E² are the needle valves by means of which the feed may be adjusted. F is a screw-cap for the opening through which the reservoir is filled. G is a pipe union by which the pipe through which the exhaust gases arrive is connected to the reservoir. H H are unions for coupling the oil pipes leading to the lubricated surfaces to the reservoir. I is a glass gauge, indicating the height of the oil in the reservoir. J J are lugs for attaching

the oiler to the vehicle. K K are tubes passing through the reservoir and connecting the sight feed tubes with the pipe unions H. L is a pipe by which the exhaust gases are led to the highest point of the oil reservoir, which is provided with a calibrated opening, calculated to avoid a sudden rise in pressure when the exhaust valve opens.

The lubricator operates as follows: When the motor is in operation a part of the exhaust gases passes through the tube to the oil reservoir and exerts a pressure on the surface of the oil. The oil having no other way to get out of the reservoir, it will ascend the tube depending from the column C, pass up through the column itself and through the distributing pipe, where it is distributed by the various needle valves; it then passes through the sight-feed tubes and through small brass or copper tubes to the parts to be lubricated. In case the motor stops the gas pressure ceases, and the action of the lubricator stops immediately.

THE motor-car industry in America is progressing by leaps and bounds. In Boston, an enterprising firm have decided to erect a five storied and basement building solely for motor-vehicle purposes. This is said to be the first building of its kind in the world. Each floor will contain 5,000 square feet of space. The second and third floors will be devoted to offices and showrooms for manufacturers' agents. The upper floors are to be fitted up for club purposes, with reading and lounging rooms, library and offices.

HERE AND THERE.

NOTWITHSTANDING the success of the car he used in the Nice races, M. Serpollet is reported to be building a much faster car for the forthcoming Paris-Berlin race.

THE case of the Daimler Motor Company, Ltd., v. the British Motor Traction Company, Ltd., is down for hearing, before Mr. Justice Buckley, in the Chancery Division on Monday next.

MR. G. H. BECHTEL, of 5, Lord Street, Southport, has been appointed local agent of the Motor Manufacturing Co. Mr. Bechtel also undertakes any repairs or accumulator charging, and has plenty of room for storage.

M. RENE DE KNYFF and Commandant Krebs have had out on the road the Panhard car intended for the Gordon-Bennett race, and express themselves well satisfied with the trial trip. It is said that the Mercédès cars have been sent back to Cannstatt to be speeded up for the event.

MESSRS. BRADBURY BROS. have just opened large premises, at 108, High Street, Croydon, nearly opposite the new theatre, for the purpose of building motor-cars and cycles. We understand from Mr. H. W. Bradbury that they intend making a special feature of a powerful two-seated voiturette.

THE two Panhard cars taken over to the United States by Mr. J. W. S. Langerman and seized by the United States customs authorities for alleged under-valuation, are still in the hands of the authorities. The amount necessary for their redemption is £1,734, the foreign value, plus the duty.

THE experiments recently made by the post-office authorities in Toronto, Canada, in collecting and delivering mails for the district offices of the city by motor-cars having proved successful, a further step is being taken in the same direction by using motor vehicles for collecting from the street letter boxes.

A LITTLE English Panhard car, owned by a Bournemouth gentleman, caught fire at Southampton one day last week outside the works of Messrs. A. B. Collis and Co., of West Quay. The fire was caused through the overflowing of the float chamber which controls the flow of petrol to the burners. Luckily, little damage was done.

MR. BURFORD, formerly of Messrs. Burford, Van Toll, and Co., of Twickenham, and latterly with the Motor Manufacturing Company, has accepted the management of the London office of Messrs. J. F. Milnes and Co., who have taken Motoria, Balderton Street, Oxford Street, W.C. The new firm will make its *debut* at the Automobile Club Show, and we wish Mr. Burford success in his new position.

IN his examination before the Norwich Bankruptcy Court Benjamin John Quinton, fruiterer, of Norwich, stated that he bought a motor-car to ply between Thorpe and the Market Place, its cost, to be paid by instalments, being £520. The motor-car did not pay, and being unable to keep up the instalments, the car was seized. He had paid £190 in instalments and the machine had cost him about £40 for expenses of various kinds.

THE motor-car has found its way into the rocky region of British Columbia, where the Boundary Auto-Traffic and Transportation Company, Ltd., has been formed to run a motor-car service throughout the day between Grand Forks and Columbia, touching at various intermediary points. A daily service will also be run between Columbia and Republic. This will be the first transportation company in the colony to run a motor-car service.

MR. JOHN HENRY KNIGHT has suggested that as members residing in the country are unable to attend to hear papers read in the evening, there should be in addition to the ordinary monthly evening papers a certain number of afternoon papers. The Committee of the Automobile Club has decided to ask Mr. John Henry Knight to read a paper in the afternoon with a view to ascertaining whether there is a demand for afternoon papers.

MR. WILLIAM LEA, of the "Liver" Motor-Car Works and Show-rooms, has offered to place his large depôt at Park Entrance, Birkenhead, at the disposal, free of cost, of members of the Automobile Club and other visitors on the occasion of the Club's visit to Liverpool in connection with the forthcoming Heavy Motor-Vehicles trials on June 1st. The depôt will accommodate from thirty to forty cars, and, if the space be insufficient, five or six cars can be accommodated at 16, Berry Street, Liverpool.

THE Motor Car Company, Limited, of 168, Shaftesbury Avenue, W.C., ask us to state that they will have pleasure in meeting any of our country readers who contemplate visiting the Show at the Agricultural Hall to-day or during next week at any station in London with a Decauville car, to convey them to the Exhibition. They will also give their driver instructions to hand his passenger an entry ticket, free of charge. Anyone wishing to take advantage of the offer should drop a line to the company notifying station and time of arrival.

MR. F. MITCHELL, of 55, Washway Road, Sale, near Manchester, has sent us a specimen of his "Clipper" Hinge Belt Fastener. The "Clipper" fastener, it is contended, has many advantages over all other ways of fastening ends of belts together. It passes over the pulley as smooth and pliable as an endless belt, and by reason of the hinge joint it does not break the belt while bending over the pulley. The belt can also be taken apart for any change necessary in an instant, and put together again just as readily. Specimen joints may be had on application.

MR. MALCOLM BROOKE, of Egremont, Cheshire, has also forwarded particulars of his new belt fastener. The fastener consists of a special hinge clip with upper and lower jaws, the jaws having four teeth in the lower jaw and three in the upper. The teeth are pressed into the belt, alternately not directly, on top of each other. The fastener is made of malleable iron, so that the jaws can be easily opened and the belt reinserted. The fastener being hinged will grip the smallest pulley possible, and there is not a chance of its coming off the strap, as the under jaw will prevent this.

WE announced some time ago that Messrs Hewetson's, Limited, the agents for the well-known Benz cars, were removing from Dean Street, Soho, to more commodious premises at 251, Tottenham Court Road, W. The new depôt, which is situated

near to Oxford Street, has six immense floors. In the basement a complete repair plant is being put down, all the machine tools being driven by electric motors. There is large and safe storage for petrol, and large stocks of all the parts of the various belt and gear-driven Benz cars handled will always be kept on the premises.

MR. F. J. BELL, of the New Era Laundry, Pokesdown, Bournemouth, in writing to the Motor Manufacturing Co., Ltd., expresses the greatest satisfaction with the two M.M.C. 6 h.p. motor-vans supplied to the laundry company. On one occasion whilst out distributing goods the engine of one of the vans was working for over eight hours, and drawing a load of

over a ton. The distance travelled was over fifty miles, and the petrol consumed 24 gallons. Considering the hilly nature of the district, and the heavy work the van has to do, the result is regarded as highly satisfactory.

MESSRS. HENRY CRAGG AND SONS have opened new premises in Church Street, Altrincham, on the high road from Manchester to Chester, Warrington, and Liverpool, in addition to their premises in Railway Street, Altrincham, situate on the low road from Manchester and Stockport to Chester, etc. Motor spirit, oils, greases, plugs, etc., can be obtained at both places, and accumulators charged at the Railway Street Depôt. Accommodation is available for half-a-dozen large cars, and the firm is prepared to undertake all kinds of repairs to motors and automobiles.

WE regret to learn from New York of the sudden death of Mr. W. Tousey, who went out to the United States some months ago to take up the position as Acting Sec-

retary of the Automobile Club. Mr. Tousey was well-known in motoring circles in this country, he having taken an active part in the 1,000-mile Trial last year.

BARON THEODORE LIEBIG, one of the leading Austrian automobilists, is to be married this month. Immediately after the wedding he will take his bride on an extensive motor-car tour through Upper Italy, France, and Switzerland, returning through the Tyrol and Vienna to Reichenberg. The tour will extend over more than two thousand kilometres. The Baron's well-known racing carriage will be fitted up as a luggage waggon, while the bridal pair will ride in a light two-seat 10 h.p. automobile without a *mecanicien*.

ELEVATION AND PLAN OF TOURAND CAR.
(For description see issue of April 27th, 1901).

SPRAGS.

MR. W. R. PIDGEON, of Falmouth, and Mr. Bradley, members of the Automobile Club, write to the *Club Notes* stating that they have between them got round the sprag difficulty in a way that they think may be useful to many motorists who use their cars in hilly districts. Mr. Pidgeon had trouble with his car on the steep Cornish hills until they schemed a double sprag, which has so far never failed, and which goes in so quickly as to prevent any jerks being felt. The car had the ordinary sprag fitted from the first, but this was uncertain in its action, and frequently slid back over the smooth surface of these excellent roads. It could not be made shorter and steeper, or the car would have jumped it, so a second short sprag was hung from the same pivot as the long one and the two chained together low down close to the road. The short sprag hangs at about 60 deg. to the road and goes in instantly the car backs, and in doing so tightens the chain and drags in the long sprag which holds the car. Mr. Pidgeon adds that it is important to

AB = ordinary sprag, 35" long.
AC = short sprag, 23½" long.
DE = strong chain long enough to allow 2½" slack.
BC = ground.
A = pivot of both sprags, 22½" above ground.
Each sprag swings freely and independently on A.

allow about 2½ inches slack in the chain so as to enable the short sprag to get a good hold before it begins to drag in the longer one.

STORAGE OF PETROLEUM.

At Southwark Police Court, last week, before Mr. Paul Taylor, Messrs. D. Napier and Sons, motor-car manufacturers, of Vine-Street, York Road, S.E., were summoned by the London County Council, under the Petroleum Act, 1871, for keeping petroleum without a licence. Mr. Godfrey was for the London County Council; and Mr. Minton-Senhouse, barrister, defended. Mr. Godfrey stated that on April 3 Inspector Ross found a considerable quantity of petroleum on the defendants' premises, which Mr. Napier said was used to test the machines with. Mr. Minton-Senhouse submitted that the case came under the regulations of the Secretary of State made in pursuance of the Locomotives on Highways Act, 1896, and not under the Petroleum Acts. Section 5 of the former Act stated that the use of petroleum for the purposes of light locomotives should be subject to the regulations of the Secretary of State, notwithstanding the Petroleum Act, 1871. Mr. Godfrey contended that these regulations applied only to private individuals who possessed motor-cars, and not to trade premises. Mr. Minton-Senhouse said that they would also apply to this case, as the petroleum was not used in the manufacture of the machines, but only for the purpose of running them. Mr. Godfrey stated that a dozen similar manufacturers of motor-cars had been licensed under the Petroleum Acts. Mr. Minton-Senhouse. —Then I pity them. Mr. Godfrey. —This is the first time this question has been raised in Court. Mr. Paul Taylor said he agreed with Mr. Minton-Senhouse that the Petroleum Acts did not apply to this case. It was quite clear that before the Act of 1896 no legislation had taken place which contemplated the existence of these machines, and these regulations, under section 5 of the Locomotives on Highways Act, 1896, were made in consequence. The summons would be dismissed with £10 10s. costs, and he would be pleased to state a case if required.

Mr. Jesse W. Godfrey, from the solicitors' department of the London County Council, attended at Southwark Police Court on Monday, and asked the magistrate (Mr. Paul Taylor) to state a case for the High Court in regard to the dismissal of the above summons. The defence was that inasmuch as the petroleum was used only for testing motor-cars, it was expressly exempted from the requirements of the Petroleum Acts, and was subject only to regulations by the Home Secretary under the Light Locomotives Act of 1896. Mr. Paul Taylor held that the defence was established, and dismissed the summons. It being the first case of the kind, the County Council now desired to appeal, and the application for a case was granted.

FURIOUS DRIVING CASES.

MR. BUCKNALL, of Wickhurst Manor, near Sevenoaks, while driving his 25 h.p. Canstatt Daimler through Sevenoaks, on Wednesday, April 17th, was charged with driving furiously to the danger of lives and limbs of passengers on the highway. The summons came on for hearing on Friday, April 26th. The evidence given for the prosecution was by two police constables, who swore Mr. Bucknall was travelling over twenty-two miles an hour. They admitted that there was no traffic on the road. They swore, however, there were sixteen or twenty foot passengers who had to scamper out of the way; but further they admitted that no life was in danger or limb injured of any passenger on the highway. Upon this, Mr. Staplee Firth rested his defence, and while arguing the law point, the Chairman asked him if he thought it was worth his while occupying the time of the Court any further, as it was a case which had taken up a considerable time. Mr. Firth replied, and said that if they stopped the case and dismissed the charge on the ground that the evidence was insufficient, he would not object and that he thought they certainly had heard quite enough to justify them in doing this. This raised a scoffing remark by the chairman, which sufficiently shewed that they intended to convict in any case, whereupon Mr. Firth pointed out that it was not the duty of a magistrate to prejudge a case and come into court with the firm intention of convicting, and that it more than surprised him that any magistrate should suggest that a defendant should not go on with his defence but submit to a conviction, and he certainly should not do so on his client's behalf. The Bench retired to consider their decision and they ultimately dismissed the case, but refused to allow any costs to Mr. Bucknall.

THE Silesian Automobile Club is in course of formation at Breslau, Germany.

THE Automobile Tour of Italy commenced at Turin on Saturday last. There were altogether seventy-one entries, but of these only thirty-one started.

EIGHT entries have so far been received for the Paris-Bordeaux race, which is fixed for May 29th. The names include Levegh, Charron, and Girardot.

A MOTOR-CAR has been driven up Mount Vesuvius, the trip having just been made past the Observatory to the Cable Railway station 2,590 feet above the level of the sea, by Count and Countess Schonborn-Buchheim in his new 14 h.p. Benz phaeton.

LA SOCIÉTÉ FRANÇAISE D'AUTOMOBILES, of 20, Quai de Suresnes, Suresnes (Seine), have forwarded us an illustrated booklet on the La Doctoresse car. The booklet is in a very attractive form, the illustrations being exceptionally well produced.

THE staff of our French contemporary, *Le Chauffeur*, last week gave a banquet to Madame Lockert, the proprietress of that paper, to commemorate her election as *Officier d'Académie*. Madame Lockert has this week come over to London to participate in the Exhibition in the interests of her publication and a number of French firms. She is also responsible for the excellent collection of posters which will form one of the features of the Show.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, MAY 11, 1901.

[No. 114.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT the Agricultural Hall this week one great fact is being demonstrated beyond dispute—viz., that the automobile industry has settled down in this country and will soon rank among the recognised British trades. For not only have English makers got to work in real earnest, but the lively interest of the public has never found such an outlet as is provided by the Motor-Car Exhibition. Comparing Saturday last with the opening day of the previous display, one could readily be convinced that the public interest has trebled so far as motor-cars were concerned. Right away from the moment the turnstiles commenced revolving there has been a steady stream of visitors, and the scene inside the hall has been an animated one. Certainly the general concern in the Exhibition has been amply rewarded, for never before, in this country, has there been seen such a varied collection of automobiles as that which will not disperse till 10 o'clock on Saturday, the 11th inst.

Business Brisk.

WHILE the public have been pleased, the exhibitors have been delighted. On Monday reports of good sales were current throughout the Show, and it was evident that hundreds of people had postponed purchases till the Exhibition. The aristocracy have been well represented all the week, and from every part of the British Isles gentlemen have come not only to see the latest types of vehicles, but to buy the best they could afford. This is a tendency which non-exhibiting firms overlooked—to their own disadvantage and to the advantage of the exhibitors, who have made the most of such a favourable occasion.

King Edward and his Driver.

IN the course of an interesting article in the current number of *Cassell's Magazine* entitled "The King at Play," Mr. M. Randal Roberts remarks that His Majesty seated in his motor-car is a well-known figure on the roads about Sandringham. His Majesty does not drive himself, but he thoroughly understands the mechanism of a motor-car, and takes great pride in the prowess of Mr. Letzer, his driver. The author also tells the following story, which, if we remember rightly, has not been given before. Some time ago, when the King was driving with a couple of friends from Sandringham to Wolverton Station, a distance of about three miles, the King told his driver to show his guests just what a motor-car could do. The distance was covered in five minutes; and as the car arrived at the station gates the King exclaimed to his friends, "Now watch Letzer just miss the gate-posts and pull up," an order which Mr. Letzer fulfilled to the letter.

The Chinese Ambassador an Automobillist.

THE fact that the Chinese Ambassador rides from Langham Place to the Foreign Office in a motor-car of fine proportions and rather Oriental colour seems to rankle somewhat in the heart of certain individuals, who appear to think there is something undiplomatic about a carriage without horses, even when it is as resplendent as the yellow jacket of Oriental fame. As a matter of fact, his Excellency Sir Chichen Lofengluh has merely vindicated the reputation for unprogressiveness which his country enjoys as far as his capacity goes, and from the motor-car of its British representative China may learn a lesson to follow. No doubt, remarks the *Court Journal*, if this lead is generally followed by other Ambassadors, the courtyard of St. James's Palace will appear somewhat unusual upon the occasion of coming Levées.

The Life of a Motor-Car.

ONE of the questions most often put to the automobilist by the new convert who is about to purchase a car, especially if he contemplates using it for professional or business purposes, is rather apt to puzzle him, as it is difficult to give a direct answer to "How long will it last?" As, however, there is no reason why a piece of mechanism should not "last" for ever, with due replacements of worn parts, though such a reply would hardly satisfy the inquirer, the question should more properly take the form; "What is to be allowed for depreciation and repairs?" The usual figure of 15 per cent. may be taken as a fair estimate for the light car or substantial voiturette in careful hands, if about £1 per 1,000 miles be added as the cost of pneumatics; but the lighter and cheaper forms of vehicle will probably considerably exceed this, as will also really fast cars, the cost of upkeep rising rapidly with speeds over, say, a fifteen to eighteen miles average. The hard and constant use, too, that a doctor's practice involves may necessitate a rather higher figure; but, on the other hand, the more a car is worked the more marked is its economy, and in this latter case the saving over other means of transport would, where two horses are replaced, cover three times the amount mentioned. Where a vehicle is only used for pleasure purposes, however, a rational estimate of the above kind is almost impossible, and it can only be remarked that a car does not deteriorate with age, but only with use, while the fall in value due to "out-of-dateness" varies from accidental causes, and may generally be taken as less in the case of the productions of old-established firms than with newer ones.

Goggles.

WITH the increasing necessity for, and use of, optical protection of some kind when driving, it is worth drawing attention to the necessity for care in the choice of spectacles or goggles for this purpose, and to the fact that cheap glasses may prove very expensive to the eyesight. It is of as much importance that the glasses used in motor goggles should be carefully worked and free from striae and irregularities as in the case of ordinary spectacles, and the use of inferior ones for

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

hours together, more particularly as the eyes are under a more or less constant strain the whole time, cannot but be highly injurious. As, moreover, the glasses are often removed in full sunlight, it is on the whole preferable, unless perhaps in cases of weak eyesight, to have them of as pale a shade as possible, many of those sold being too dark, and more suitable for pathological than for healthy subjects.

Motor Fire Engines for Eccles.

ECCLES has not only followed in the footsteps of the London County Council but gone one step further, albeit with some misgiving. Its Town Council has adopted the report of the Watch Committee, who recommend that a motor-car be obtained for carrying firemen and fire extinguishing appliances, and that horses and manual be sold. Over cautious Councillors urged the advisability of retaining horses till motor traction had been tested.

Motor-Cars in Parliament.

A BILL, known as the Steam Engine and Boilers (Persons in Charge) Bill, and having for its object the granting of certificates to persons in charge of engines and boilers used in mines, but exempting engines or boilers used on railways, steamships, or for domestic and agricultural purposes, steam rollers and traction engines, introduced by Mr. Jacoby, has passed its second reading, been referred to a Select Committee, and will no doubt soon become law. The motorist need not, however, fear further persecution on that score, for, in reply to a question from Mr. Scott-Montagu, Mr. Jacoby stated that the promoters of the Bill were prepared to exclude motor-cars.

"Another Injustice to Ireland."

WHEN the County Surveyor for Meath informed the Council and road contractors of that county, a few days ago, that an "automobile excursion" would shortly traverse the roads under their charge *en route* from Dublin to Enniskillen, and courteously expressed the hope that their roads would be found in good condition, a violent outburst of motorphobia was the result. A member of the enlightened body proposed the imposition of a heavy tax on a "nuisance." Another referred to the proposed tourists as "an English crowd," and suggested that they should stop in their own country. "Not wanted," was the unanimous verdict. All the same, we venture to predict a very cordial welcome in Meath as elsewhere in Ireland. Pat is a warm-hearted fellow, and does not harbour an atom of that ill-feeling towards England, or disloyalty, displayed by the local jack in office, and some others elsewhere, who certainly ought to know better.

Birdlip Hill.

AT the last meeting of the Standing Committee of the Automobile Club the secretary drew attention to the recent motor-car accident on Birdlip Hill, and suggested that the Club should erect at the top of the hill a caution to drivers of motor-vehicles. The Standing Committee were of opinion that caution boards should be erected, one at the top and another half way down, and that they should draw attention to the length of the hill and the steepness of the incline. The settlement of details was referred to the Roads and Traffic Committee.

Alcohol as Motor Fuel.

AT the last meeting of the Alcohol Committee of the Automobile Club, Mr. Blount expressed the view that so far as experiments had yet been carried out there seemed to him to be little to expect from alcohol as a suitable motive power for motor-vehicles. Mr. Pretty related his experiences with regard to the use of alcohol in a recent trial which he had given

it. He drew attention to the advantages in connection with the use of alcohol in respect of its emitting no smell whatever, and of its more expansive explosion and consequently smoother running. It was ultimately, at the suggestion of the Chairman, decided to recommend that the terms of reference should be extended so as to enable the Committee to consider and report on the fundamental question whether the advantages attaching to the employment of alcohol as a substitute for petroleum in internal-combustion engines were such as to render it important in the interests of automobilism that existing impediments in the way of such use in this country should be removed.

Tied Up.

AN extraordinary accident happened to Colonel McGrath recently. He had unshipped a new car at Waterford, and was driving it home to Wexford, when suddenly his progress was stopped in a mysterious way. The steering went out of his control, and before he had time to check his pace the car had dashed into a telegraph pole by the roadside. The vehicle was badly damaged, but the Colonel and the driver fortunately escaped with a shaking. On examining the car he soon solved the mystery. The front wheels were found completely clogged up with telephone wire, some coils of which must have lain across the road. It was a portion of the wire used in laying a new telephone line near by, but how it got out on the highway remains a question which has yet to be solved.

The Motor Union.

AT the Agricultural Hall on Wednesday, the 8th inst., there was held a meeting of the members of the Automobile Club and other members of the Motor Union, to elect representatives for the Executive Committee of the Union. The gentlemen elected were, Professor Boys, Mr. Charles Cordingley, Colonel Crompton, Mr. H. Edmunds, Mr. G. Helmore, Colonel Holden, Mr. Manville, Mr. Phillips, Mr. Lyons Sampson, Mr. F. R. Simms, Mr. S. Spooner, Mr. H. Sturmeay, Mr. Thornycroft, jun., Mr. Critchley, Mr. Northey, and Mr. Milton.

The Width of Indianrubber Tires.

FOLLOWING on the correspondence between the Local Government Board and the Automobile Club with reference to the regulations of the L.G.B. which prescribe, for instance, that a vehicle weighing unladen over a ton and having indiarubber tires, shall be fitted with tires of not less than three inches in width, the Club Secretary suggested that the Inspectors of the Board should make a journey on a car weighing over a ton and having indiarubber tires of a width which, under present regulations, are illegal, being less than three inches in width, with a view to noting what was the effect of the tires on the road surface. The Motor Manufacturing Company, Ltd., kindly placed at the disposal of the Club a wagonette, and on Thursday last week Colonel Phipps Carey, Chief Engineering Inspector of the L.G.B., and Mr. G. W. Willcocks, Engineering Inspector of the L.G.B., three members of the War Office Committee on Mechanical Transport, the driver and ballast representing the weight of two persons, were driven in this car from the Club to Dashwood Hill and back again. The weight of the car unladen was over a ton, and the width of the indiarubber tires was 2½ in. The Club Secretary has ascertained that the weight of a London Road Car Company's omnibus, unladen, varies between 33cwt. and 40cwt., and the width of the tires (iron) at present used by the company is 2 in. The Inspectors of the Local Government Board had a striking illustration on Dashwood Hill of the damage done to the road surface by horse-drawn vehicles and motor-vehicles respectively. The motor-vehicles skinned down hill without doing more than raise the dust on the surface of the road. The Oxford and London coach descended with an enormous shoe on the back wheel which ploughed up the road surface, while its four horses were digging the toes of their iron shoes into the roadway.

Obstruction. An Important Decision.

MR. W. C. BERSEY was summoned at the Marlborough Street Police Court "for that he did by means of a motor-car wilfully cause an obstruction." The evidence for the prosecution was given by a police constable, who stated that at one o'clock on April 15th, he was in Piccadilly; that a motor-car was standing outside certain premises causing considerable obstruction, and that the motor-car was the property of the defendant. Mr. Staplee Firth, who defended, asked the officer if he had any other witness, and upon receiving a reply in the negative, Mr. Firth stated he should not cross-examine him. The magistrate asked Mr. Firth if he intended to call evidence for the defence. Mr. Firth stated that he did not propose to call evidence to defend a case that had never been made out; upon which the magistrate quickly intimated that he considered the case was made out. A long argument followed, and ultimately the magistrate stated that he would adjourn the case for seven days to consider the law and the arguments raised. This deliberation has taken place, and we are glad to say that the magistrate, Mr. Fenwick, has decided to dismiss the summons.

THE RECENT PARIS-ROUBAIX ALCOHOL MOTOR RACE.—THE CARS LEAVING THE A.C.F., PLACE DE LA CONCORDE, PARIS.
(Cliche de) [L'Avenir de l'Automobile.]

Mr. Firth argued that any carriage stopping at any place on the side of a public road when there is traffic must cause some obstruction, and that it was clear the legislation contemplated that motor-cars stopping on the roadside would cause obstruction; they therefore enacted the regulation to the effect that the light locomotive should not be left so as to cause any unnecessary obstruction, and although in the above case Mr. Bersey was accused of wilful obstruction under an old Statute of II. and III. Victoria, there was no evidence to prove wilful obstruction; in fact, there was no evidence at all of obstruction. The police-constable stated that Mr. Bersey was causing obstruction, instead of giving evidence of some act or acts done or omitted to be done, which in themselves were sufficient for the Court to find that obstruction had been caused. The result of this decision and the recent decision obtained by Mr. Firth from the City magistrates, "that a light locomotive need not be left in charge of a competent engineer," are steps in the right direction; the result of the two decisions being that a motor-car may be left at any place of call, and it need not be attended by any person at all; and moreover it is allowed to cause necessary obstruction, and the only cases in which the driver or owner will be held to be responsible will be those where they cause unnecessary or wilful obstruction.

High and Low Speed Petrol Motors.

MANUFACTURERS of voiturettes have long been troubled with their motors because, while one motor did not give sufficient power, it was very difficult to synchronise two so as to get a maximum efficiency. These troubles have now been partially overcome by the single-cylinder high-speed engine made to develop up to 6 h.p., the cylinder being provided with a water jacket. While high-speed engines have thus been increasing in power, however, other makers have been working in an opposite direction, and are producing relatively low-speed motors running at about 800 revolutions a minute. Of course, for a given power, these are heavier than the high-speed engines; but, on the other hand, they have the advantage of being more reliable and of giving less trouble. At present the majority of small motor-car builders in France are using high-speed motors because they can be obtained more easily and more cheaply, but it is quite possible that before very long the advantage of the low-speed engine will bring it into increasing employment on light cars, though, of course, the light and fast running motor will still be used on motor-cycles.

Automobilism in Egypt.

MOTORING has lately become quite a popular pastime in Cairo, where about twenty vehicles are already in use, in addition to several motor-tricycles and quadricycles. The Khedive is often to be seen in his De Dion voiturette, a car of the same make being used by Prince Aziz Bey Hassan. The roads in the district are, however, not very favourable for motor-vehicles, so that the prospect of automobile tours in Egypt is not very great. A motor-vehicle repair establishment and garage has lately been started in Cairo by a French engineer.

Motor-Cars in Australia.

THE suitability and cheapness of motor-cars for travelling over the rough roads of Australia have recently been demonstrated by a run from Warrnambool to Melbourne, a distance of 165 miles, in a day. The vehicle used was a 3½ h.p. De Dion-Bouton voiturette, with seating accommodation for three persons. The average rate of travelling was 17 miles an hour, the fastest riding being 22 miles an hour, and the whole time spent in the journey being just over nine hours and a half. The motor consumed five gallons of petrol and a quart of lubricating oil.

CONSUMPTION AND HILL-CLIMBING.

IMPORTANT TRIALS BY THE AUTOMOBILE CLUB.

DASHWOOD HILL was the scene of an extraordinary display of activity on Thursday, the 2nd inst., when the combined hill-climbing and consumption trials promoted by the Automobile Club were brought to a successful issue. The full scheme of the operations was published in our issue of last week, the only alteration in the programme being the substitution of seven ascents for six.

Mr. R. Horner Wyeth, Mr. W. H. Kitto, Mr. Edgar Scamell, Mr. A. Ledger, and Mr. E. de Wilton.

The following were the competing cars which assembled at the start, though Mr. J. R. Hargreave's 19 h.p. Daimler proceeded from Norwich to Dashwood Hill direct, and took part in the hill-climbing trial only:—

CAR.	OWNER.	CYLINDERS.	IGNITION.	OBSERVER.
24 h.p. Daimler	Hon. J. S. Montagu, M.P.	Four	Tube and electric	Mr. R. B. B. Bruce.
16 h.p. Napier	Mr. J. A. Holder	Four	Electric	Mr. C. L. Freeston.
8½ h.p. Decauville	Motor-Car Co.	Two	Electric	Mr. R. W. Buttemer.
7 h.p. New Orleans	New Orleans Motor Co.	Two	Electric	Mr. R. H. Wyeth.

THE 5 H.P. DECAUVILLE. MEASURING OFF PETROL.
Photo by j

THE 6 H.P. DAIMLER. LORD KINGSBURGH CONSULTING HIS NOTES.
(Mr. R. W. Buttemer)

PREPARING FOR THE HILL CLIMB.
Photos by j

It was inevitable that the day's proceedings should open at a very early hour, and the competing cars and their observers assembled at the Norland Mews, Princes Road, Holland Park Avenue, by half-past eight. On behalf of the Technical and Trials Committee, Mr. T. B. Browne and Mr. Lyons Sampson supervised the arrangements for the emptying of the tanks, and the subsequent replenishing of each with a measured quantity which should suffice to carry the car to Dashwood Hill. There were also present as honorary observers the Lord Justice Clerk, Mr. R. B. B. Bruce, Mr. C. L. Freeston, Mr. R. W. Buttemer,

MR. J. R. HARGREAVE'S 19 H.P. DAIMLER COMING UP THE HILL.
(Mr. Percy Richardson.)

6 h.p. Daimler	Daimler Motor Co.	Two	Tube and electric	The Lord Justice Clerk.
5 h.p. Decauville	Motor-Car Co.	Two	Electric	Mr. W. H. Kitto.
5 h.p. Mayfair	Sports Motor-Car Co.	One	Electric	Mr. E. Scamell.
5 h.p. Wolseley	Wolseley Tool and Motor Co.	One	Electric	Mr. A. Ledger.
3 h.p. Ariel Quadricycle	Ariel Motor Co.	One	Electric	Mr. E. de Wilton.

As quickly as possible the cars were got away in turn, and, after being weighed at a neighbouring coal siding, they set off on the opening stage of the trials without returning to the milestone in Holland Park Avenue, as is usual in the quarterly hundred miles' trials. The fact that the road was up at Ealing,

and that a long détour had to be made from Acton Hill to Ealing Dean accounts for this departure from established practice.

Another innovation in the trials under notice was the promulgation of an insistent rule that very moderate speeds should be observed on the outward and home journey alike, and that, in fact, any car which occupied less than one hour and fifty minutes between the starting place and Dashwood Hill would be disqualified. It did not avail, moreover, to exceed this speed and indulge in stops, voluntary or involuntary; the actual running time was required to be 1h. 50min. or over. Naturally an embargo of this kind was somewhat irksome, particularly to a car of the calibre of Mr. John Scott Montagu's big Daimler, but the conditions were cheerfully endured, and none of the competitors were disqualified.

There was a narrow shave in this respect, it is true, for the New Orleans came in ten minutes too soon on the homeward journey, but on enquiry it was found that the driver had not been aware that he was breaking the regulation, and the disqualification was withdrawn. As will be seen later on, this car made the best performance, and it would have been a pity had its record been nullified by a breach of the regulations. Future competitors would do well to note, however, that the Club restrictions as to pace will be strictly enforced.

Two cars did not get through the initial non-stop run, namely, the 16 h.p. Napier and the Mayfair voiturette. The former did not leave the mews until a considerable time after the others, as Mr. Holder had been unable to affix a special tap to his petrol tank, and could only drain it out by disconnecting the feed pipe from the carburettor, a very lengthy process. When the car actually started, however, it was soon found that the pipe was partially choked, and could not feed the carburettor fast enough. All efforts to clear it there and then being ineffectual, the run was abandoned, and the car worked back by short stages to the starting place. The other car which had bad luck, the Mayfair, stopped for a heated axle at the end of nine miles, then, again, at the twelfth mile, and at the thirteenth abandoned the run owing to the same cause.

On arrival at Dashwood Hill it was found that Lt.-Col. H. C. L. Holden, Mr. R. E. Phillips, and the Club Secretary had driven over on Wednesday evening to High Wycombe in a 10 h.p. Delahaye lent by the Automobile Manufacturing Company. Mr. Worby Beaumont had driven down in Mr. Boulton's 12 h.p. Cannstatt Daimler, fitted with the Hall hydraulic gear, and Mr. H. J. Swindley, the honorary timekeeper, had ridden down per cycle. Mr. Hargreaves had utilised the night for his drive from Norwich, arriving in the small hours, while Mr. F. T. Bidlake, who also acted as an honorary timekeeper, had cycled across from New Barnet.

The consumption measurements having been only noted so far as the outward run was concerned, the tanks were again partially filled and the hill trials commenced. Mr. Phillips was the starter at the bottom and Mr. Swindley timed, while at the summit Mr. Johnson started and Mr. Bidlake timed, Lieut.-Colonel Holden and Mr. Worby Beaumont making themselves responsible for the fuel measurements. It need hardly be said that all the honorary officials concerned had a very lively time, and Messrs. Bidlake and Swindley had no less than fifty-six separate records each to make.

As for the public, they were afforded a free show of three hours' duration, and can hardly have felt cause to complain on the score of tediousness. To see Mr. Montagu's and Mr. Hargreave's cars romp up the hill and glide down again by gravity was a sight such as is rarely enjoyed, while the way in which the smaller cars breasted the hill was also something to remember. It may be pointed out that the hill is practically much steeper than the mere statement that it averages 1 in 14.3 would imply, as for a stretch of no less than 1,100 feet the average is 1 in 10.3, while there are bits that are steeper still.

An instructive incident while the trials were in progress was the arrival of the Oxford and London coach, which perforce descended with an enormous shoe on the back wheel, ploughing up the surface, while the sharp edges of twenty horse-shoes were further "improving" the roadway. All the cars, on the con-

trary, simply skimmed over the top on pneumatic tires. No doubt the object-lesson was not unnoticed by Colonel Phipps Carey and Mr. G. W. Willcocks, who attended on behalf of the Local Government Board. Three members of the War Office Committee on Mechanical Transport, it may be added, were also present.

Six of the seven vehicles which eventually left the scene of these interesting operations made a non-stop run back to the Norland Mews, where Messrs. Browne and Sampson were again in attendance and the final measurements were noted. The results have since been worked out by the Technical Committee, and are published in great detail in the *Automobile Club Notes and Notices*; but the salient particulars are included in the tabulation which we append herewith:—

TRIAL A (Outward Journey).												
Car.	Weight without passengers			Weight with passengers			Stops	Average Speed.	Consumption.	Passengers	Average weight.	
	T. C. Q. L.	T. C. Q. L.	T. C. Q. L.	T. C. Q. L.	T. C. Q. L.	T. C. Q. L.	1 of	Upto legal limit				
24 h.p. Daimler	13	2	0	17	2	0	28 m.		2.125 gall.	3	10st. 7lb.	
8½ h.p. Decauville	12	1	20	15	0	0	None	"	1.5 "	2	10st.	
7 h.p. New Orleans	10	3	7	15	1	21	None	"	1.03 "	3	12st. 3lb.	
6 h.p. Daimler	1	1	3	0	1	7	0	None	"	1.76 "	4	10st. 7lb.
5 h.p. Decauville	7	3	0	10	1	14	2½ m.	"	1.37 "	2	10st. 7lb.	
5 h.p. Wolsley	14	1	0	18	1	0	None	"	1.046 "	3	10st. 7lb.	
3 h.p. Ariel Quadricycle	4	3	0	7	2	0	None	"	.58 "	2	11st.	

TRIAL B (Homeward Journey).										
Car.	Stops.			Average Speed.			Consumption	Passengers	Av. wght.	
				Upto legal limit						
24 h.p. Daimler	None			Upto legal limit			1.77 gall.	3	10st. 7lb.	
8½ h.p. Decauville	None			"			1.52 "	2	10st.	
7 h.p. New Orleans	None			"			.875 "	3	12st. 3lb.	
6 h.p. Daimler	None			"			1.187 "	4	10st. 7lb.	
5 h.p. Decauville	19½ m. (puncture)			"			1.45 "	2	10st. 7lb.	
5 h.p. Wolsley	None			"			.97 "	3	10st. 7lb.	
3 h.p. Ariel Quad	None			"			.43 "	2	11st.	

TRIAL C. (Hill).										
Car.	Stops.			Average Speed.			Consumption	Passengers	Av. wght.	
				Upto legal limit						
24 h.p. Daimler	None			Upto legal limit			1 gal.	2	Not stated	
19 h.p. Daimler	None			do.			.875 "	2	do.	
8½ h.p. Decauville	One			8.36 m.p.h.			.55 "	2	10st.	
7 h.p. New Orleans	None			10.36 m.p.h.			.33 "	3	12st.	3lb.
6 h.p. Daimler	None			7.40 m.p.h.			.48 "	4	10st.	7lb.
5 h.p. Decauville	None			8.68 m.p.h.			.31 "	2	10st.	7lb.
5 h.p. Wolsley	Three			3.76 m.p.h.			.337 "	3	10st.	7lb.
3 h.p. Ariel Quad	None			10.88 m.p.h.			.173 "	2	11st.	

It should be added that the stop of the 8½ h.p. Decauville in trial C was due to the driver missing his gear when changing, and that the Wolsley stopped twice on the ascent owing to a choked fuel pipe. This ascent occupied 31 min. 51 sec. in all. The car also stopped on the third ascent, occupying 7 min. 28 sec. The five other ascents were made at an average speed of 9.84 miles per hour. The Ariel quadricycle received pedalling assistance over a total of about one-third of a mile.

THE latest fad in California is the hunting of wild cats by motor-cars. The sport is said to be a great success, the hounds keeping pace through bush and timber and "treecing" cat after cat, which the motorists brought down.

MR. CHARLES T. YERKES, a well-known American motorist, has entirely given up the use of horses and has now equipped his stable throughout with electric carriages. His garage contains an electric theatre bus, a hansom cab, brougham, stanhope and brake.

THERE is a splendid opening in Shanghai for a motor-car company to build, repair, and let out for hire motor-vehicles of all kinds, says the *North China Herald*. Shanghai possesses a great advantage over many other towns in that it is an absolutely flat city.

THE Minister for Commerce of Austria has promised the Austrian Automobile Club an exhibition prize, in the name of the Government, for the motor-car show to be held at Vienna next month. The recognition of the motor industry by the State should be a valuable help to the movement in that country.

A TEIGNMOUTH resident, and enthusiastic motorist, deplors the neglect which his part of the country has hitherto received at the wheels of the touring motor-car, and sends a well-illustrated local guide as evidence of the charming scenery to be met with in Devonshire. We agree with the enthusiast. Devonshire is a perfect paradise of rural scenery, has good roads, good hotel accommodation, a bracing atmosphere, and ought not to be neglected any longer.

FLOTSAM AND JETSAM.

BY "FLANEUR."

VERY far from impeccable are certain of the notices of the Show in the daily press. The *Standard*, for example, has informed its readers that "a great space has been kept clear in the centre of the floor, so that any car can be tried at once to the utmost of its capacity." The italics are mine. We are all prone to rhetorical flourishes at times, but rarely was a sentence ever rounded off with so amusing a disregard of fact. "Any car!" Fancy a racing Panhard getting on its "fourth" in that circumscribed arena; the hypothesis is indeed refreshing. Still, the *Standard* meant well, and may be forgiven.

HARDLY can the same be said of the portentous homily which the *Daily News* hurled at its readers' heads on Monday. One or two mistakes, more or less, in a purely surface Show report are immaterial, but when an opinionated writer, blankly ignorant of the whole subject, presumes to put himself upon a pedestal, from which he lectures those who have been engaged in the automobile industry from the start, the spectacle is more ludicrous than edifying. At the outset he comments sharply on the conditions of unreadiness at the opening, and contrasts this with the state of things which characterised the inauguration of the Salon du Cycle et de l'Automobile, at which, he informs us, he was present. I, too, "assisted" at that ceremony, and may readily endorse his description of the *mise en scène*. But I can also bring forth some further facts for his consideration, which will materially enlighten his appreciation of the matter.

THE Salon was ready—but why? At the last minute the opening was postponed for four days, simply because the exhibitors were hopelessly behindhand at the appointed time. I myself left home on the eve of the long-standing date, and should have crossed to Paris and wasted the best part of the week, but for a chance call at the Automobile Club, where the *Auto-Velo* just to hand contained the intimation of the postponement. And yet the exhibitors had had the use of the Grand Palais for a fortnight or more before the opening. But what was the case at the Agricultural Hall? The exhibitors had only two days in which to run up their stands and collect their vehicles from the railway termini, for Show follows Show with such rapidity that a full measure of preparation is seldom possible.

IN his review of the exhibits at the Show the *Daily News* critic heaps blunder upon blunder. "The most striking feature," he tells us, "is the growth of the voiturette, or small car for two people." This is the opposite of the truth. The most striking feature of the last six months is the introduction of the *voiture légère*, with *tonneau* body. Two-seated voiturettes have been at a discount for long enough, and the addition of a small spider seat has become all but general. To quote again:—"The point which must strike the visitor is the greater compactness of the French voiturettes, the unobtrusiveness of the engine, and the generally greater grace of construction." These are "points" rather than a point, but singly or trebly they are entirely inaccurate. Where is the English voiturette which is inferior to the French in the attributes referred to? Further on the question of cost is dealt with as "another direction in which the French have beaten us." Automobilists may well smile at this crowning absurdity. At every degree of engine-power the English car is cheaper than the French. The familiar 6 h.p. single-cylinder *tonneau* light cars, such as the Darracq, Gladiator, and others, all range from £250 upward; the M.M.C. "Miniature Panhard" is £235. The Parisian *chauffeur* was astounded at the introduction of the new light Panhard at the last Salon, as being vastly cheaper than any two-cylinder car on the market. Had the *Daily News* man asked as to its price on Saturday he would have been told "£420"; the Motor Manufacturing Company offer a similar type of car at £350; while the New Orleans 7 h.p. car, with two-cylinder motor, is only £242 with *tonneau* body, and, as results have shown, a marvellously efficient car at that.

On the subject of *tonneaux* the reporter once more goes astray.

Though he has told us that two-seated cars are the feature of the Show, he now observes that, "A growing tendency amongst the makers is to fit their light cars with a *tonneau* body (a *tonneau* body, be it explained, consists of the addition of two seats behind the driver)." A spider seat may hold two, or the rear seat of a double phaeton, but they are neither of them a *tonneau*, and probably a French dictionary would assist the *Daily News* man to a better understanding of the subject. Then he informs us that "the motor-cycle is now a very popular institution," which is precisely what it is not. Possibly the motor-bicycle may attain popularity in time, but that of the motor-tricycle has long been on the wane. Amid many further and amazing indiscretions the scribe flounders into a comparison of the motor-buses, erstwhile of Regent Street, with the 12 h.p. and 26 h.p. cars of to-day, and marks this as the progress of a year. My good sir, there were 12 h.p. cars in the 1,000 mile Trial, British built, and very different articles from the buses so infelicitously adduced as a comparison. "Is there a market for these huge cars?" he asks, referring to 12 h.p. and 26 h.p. carriages? The Daimler and Napier people could inform him speedily enough that these vehicles sell as fast as they can be built. But it is useless to pursue this topic further; but one may at least advise the *Daily News* to set its house in order before again dictating to the automobilist.

A CHOKED fuel pipe interfered with the success of two of the cars competing in the Automobile Club's consumption trial, putting one wholly out of the running and materially affecting the hill-climbing record of the other. A plausible explanation of the mishap is that the draining of the tanks until absolutely empty, before the start, might have brought out some sediment that had previously lain quiescent at the bottom. At the same time, this is not the only thing that might have happened. An automobilist of considerable experience has since described to me the way in which, for a period of no less three months, he was troubled more or less with a choked pipe, and sought in vain for the cause. Blowing a forced draught up the pipe with a pump would clear the obstruction for a time, but soon the annoyance would recur. At last he located the cause. The interior of the tube had scaled—through the action of the petrol, he surmises—and detached a tongue of metal, with one end free and the other fast. The flow of the petrol got behind the loose end and converted it into a sort of valve, with most inconvenient results. He only discovered the solution of the mystery by removing the pipe and cutting it up in sections.

So long as the flow of petrol is not absolutely stopped, by the way, there are humorous aspects in the situation, however inconvenient it be. The car comes to a dead stop, with that curious and unmistakable dying down of power that implies a failure in the supply of fuel. "Short of pressure!" someone ejaculates, and the contents of a two-gallon tin of petrol are poured into the tank. Then the engine is restarted, in goes the clutch, and off you go once more. Another two hundred yards, and then the same subsidence of power. In goes another tinful of petrol, and the process is renewed. Perhaps more petrol is tried, if the car is a big one, before the conclusion is arrived at that the feed is insufficient; then you open up the carburettor and find it nearly empty, the petrol trickling slowly in, instead of welling up rapidly. It may happen that you try unseating the joint between the pipe and the carburettor, wriggling your way beneath the car to do so, and when no fault is found in this direction the fact that the pipe is choked higher up is certain. If it does not occur to you that to remove the nozzle of a foot-pump, and place the rubber tube over the pipe would be useful, you try to move along on the homœopathic doses that the obstructed pipe condescends to play into the carburettor. It becomes a case of scientific traffic dodging, for the moment the car gives signs of stopping you have to steer it adroitly to the gutter, to keep clear of other vehicles. This may not always be easy, and then the ribaldry of bus-drivers, cabmen, and costers breaks loose with torrential force. It is interesting while it lasts, an experience of this kind, but it is not one of such pleasure unalloyed that you hanker for its recurrence.

CONTINENTAL NOTES.

BY "AUTOMAN."

A SERIOUS epidemic has suddenly attacked the police authorities of Brussels, and, to the amazement of the automobile world, they have proposed to the Council of the Commune to establish a special force, mounted on cycles, in order to "better repress the numerous breaches of the law committed daily by conductors of motor-cars, motor-cycles, and velocipedes which compromise more and more of the traffic on the public roads." It is notorious that horse accidents are very frequent, but then that has been going on for a century, and has become one of the customs of the country. It is also notorious that there are rarely any serious motor-car accidents, but when there is one every paper in the country writes about it until it is magnified and reflected into many accidents. The new step the police are about to take, however, proves conclusively that the numbering of motor-cars is quite useless and ineffective. Here is a country where every car carries by law a large number back and front, and yet the police want cycles to chase an offender; numbering, therefore, is of no value, and is discredited in the very country where it springs from.

On the 2nd, 3rd, and 4th of June there will be an automobile fête at Namur, commencing on the Sunday with a race from Namur to Bastogne and back, 111½ miles, in which four different classes of cars will take part, viz.: (1) Carriages from 6 to 10 h.p. with at least two passengers up; the first prize will be £16 and a gold medal, the second prize £8 and a silver medal, the third prize £4 and a silver medal, and the fourth prize £2 and a silver medal; (2) carriages of more than 10 h.p., for which there will be four similar money prizes and medals; (3) voiturettes, for which the first prize will be £12 and a gold medal, the second £6 and a silver medal, the third £4 and a silver medal, the fourth £2 and a silver medal; (4) motor-cycles, for which the first prize will be £8 and a gold medal, the second £4 and a silver medal, the third £3 and a silver medal, and the fourth and fifth £2 and a silver medal each. In the evening an Exhibition will be opened and a banquet and concert will be held. On the Monday there will be a hill-climbing trial and a driving competition, and on Tuesday the distribution of prizes. The entries close on May 15th, and should be sent to the President of the Namur Vélo, 21, Rue Saint Jacques, at Namur. The membership of one of the affiliated clubs is an essential condition in all the races except that for motor-cycles.

The A.C.F. have finally decided on the route for the Paris-Berlin touring competition which is to be run in connection with the great international race from Paris to Berlin. The following is the itinerary:—

June 22	From Paris to Reims...	99 miles.
" 23	" Reims to Luxembourg	130 "
" 24	" Luxembourg to Coblenz	115 "
" 25	" Coblenz to Frankfurt...	81 "
" 26	" Frankfurt to Eisenach	112 "
" 27	" Eisenach to Leipzig	108 "
" 28	" Leipzig to Potsdam	86 "
" 29	" Potsdam to Berlin	19 "

The participators will be divided into two classes, viz., those who wish to be controlled and those who do not wish to be controlled. The entrance fee, which should be forwarded to the A.C.F., amounts to £8 for the first category and £2 for the second category if paid on or before June 1st, £16 and £3 if paid after June 1st. The entries close on June 15th. Each carriage must be entered by a member of the affiliated clubs and run at his risk. The distances are very similar to those chosen last year for the English 1,000-Mile Trial, but there is no day's rest or day's exhibition between the runs.

The separation into two classes has been made to meet the objections raised by many private owners that they don't want to be hampered by conditions and compulsory stops, but wish to jog along easily and stop and start as they please, whilst on the

other hand the makers want records of the performances of their touring vehicles for trade purposes, so that the A.C.F. has tried to please everybody, and it is to be hoped that the result will not be like the miller and his ass of Lafontaine.

The Gordon-Bennett international race is fast approaching, and all sorts of rumours are afloat. I hear of one English firm who expect to be ready this week with a four-cylinder 30 to 35 h.p. car weighing 9½ cwt. Comparing the weight and horsepower and speed of the Mercedes with these figures, this little car, if well driven, should stand a good chance; but then the great problem is to find a driver whose experienced nerves can stand the strain of such high speeds, and yet who complies with the requirements of the competition as to membership of the Automobile Club. Rumour has it that Mr. Henri Farman may be the chosen driver of this car. The Napier 70 h.p. car has been making its strides, and I understand that the second speed is judged to give as much as the fourth speed of the 16 h.p. car of the same make. There are, however, clutch troubles to be got over yet, and weight will tell very much against its chances. A persistent rumour is going round automobile circles that the German Daimler will withdraw from the race, and leave Benz as the sole Teutonic representative. Panhard and Levassor are secretly preparing for the struggle, and judging from the fact that they passed the Mercedes in the Nice races, and would have won but for a breakdown, it appears to me that they stand the best chance of securing the International Cup.

For the Italian tour, thirty-one competitors started from Turin on April 27th, at 7 o'clock in the morning. The weather could not have been worse, and the torrents of rain damped the ardour of a great many of the seventy odd who had entered their names for the tour. Amongst the starters were five foreigners and two ladies, one from Venice and the other from Padua. The roads were in a very bad condition, and the rain still continued on the 28th, when the tour left Genoa for Spezzia.

Michelin's "Monday" in the *Auto-Velo* this week is short and sweet, and tells you how to inflate your inner tube, warning you that you must first free the little rubber valve, which is apt to stick to its seat, and must be loosened by pressing on the protruding stem. If you pump without first loosening your valve you will be likely to spoil your manometer, which is only constructed to measure 150 lbs. to the square inch, whereas a man can pump 225 lbs. to the square inch.

THE Antwerp Motor-Car Exhibition was opened by the Burgomaster of that city, on Saturday, April 20th, in the Zoological Gardens, and I had a turn round it before going off to the kilometre competition. It was not much of a show, and the only new thing that struck my attention was a car in course of construction by the Société Belgica, in which there is an attempt to solve three difficult problems, namely (1) Self-starting; (2) Efficient brake power; (3) Efficient cooling of the water surrounding the cylinder head. The Société Belgica are trying to achieve these results by calling in the aid of compressed air. The compressed air is produced whenever the brake is applied, that is to say, the friction of the brake is turned into useful work and made to produce compressed air, which is duly stored in a receptacle fitted for this purpose, and having a safety and escape valve, which lets the air out when the pressure reaches a certain point. Across the car is fitted a starting cylinder, connected with the fly-wheel of the crank-shaft by a wire rope and clutch. Whenever it is desired to start the car the compressed air is allowed to pass into this cylinder, and gives the required preliminary motion to the motor. In order to cool the water the escape of compressed air is allowed to pass through a coiled tube, which is placed in the water-tank. It is well known that the re-expansion of compressed air produces cold, so that the water-tank is being continually cooled by this means, and only a little water need be carried.

FRENCH motorists and Parisian gendarmes are waging bitter war against one another. The gendarmes are on the alert to catch the motorist scorching down the streets, and have resorted to all sorts of ingenious tricks to catch the offender. Under the name of "agent chronometreur," special policemen have been provided with first-class chronometers. These "specials" take up their position on the Bois de Boulogne at a "given spot," the distance from which to another point in view has been accurately measured by him. When a motorist speeds past the first point, the policeman times him to a second spot, and invariably nabs him for furious driving. In nine cases out of ten, it is stated, the motorist can only plead guilty when confronted by the unimpeachable evidence of his time taken on a first-class chronometer.

AN Automobile Club has been organised in connection with the Princeton University, Princeton, U.S.A.

THE Hawaiian Automobile Company, Limited, Honolulu, H.I., has inaugurated a public electric vehicle service, consisting of twenty-seven vehicles of various types.

THE municipal authorities of Hanover, Germany, have just appropriated £4,000 for three automobiles for the use of the city's fire department, provided that they prove satisfactory during a certain trial period.

THE *Sketch* considers that the problem of the streets will never be solved until motor-traction is introduced. "The horse is as much an anachronism as the elephant in a huge modern city such as London is."

A MOTOR omnibus service on the Lombard-Gerin system is about to be started between the railway station and town of Eberswalde, Germany. In this system the electric vehicles run on the road, but take the current, the same as trolley trams, from an overhead conductor.

THE arrangements for the Namur-Bastogne race, in which 4,000fr. in prizes will be distributed, are well in hand. It will take place June 2, and the itinerary will be: Jambes, Assens, Emptinne, Sinsin, Hogue, Marche, Champlon, Bastogne, a distance of 180 kilometres for the round trip.

THE Automobile Club of St. Petersburg was obliged by the intense cold and snow to put off the races which were to be held on February 25th. The start was to take place at Alexandrovskaya, between St. Petersburg and Warsaw, but the snow-drifts were so deep and the thermometer so much below zero that it was considered advisable to abandon the race until a later date.

AN automobile station has been established in Philadelphia by John Wanamaker. This station will be conducted in connection with the automobile department in Wanamaker's store. The feature of this station is an automobile driving school, where persons can receive instruction in the operation of motor-vehicles. Experienced operators have been engaged, and it will be one of the most complete places of its kind in the United States.

THE Automobile Club de Var held a race meeting at Draguignan, France, a few days ago. On the first day a series of kilometre races was run off with the following results:—Motor-cycles: 1, Marius, 1 min. 4 sec. Cars: 1, De Fabrègues, 1 min. 9 sec. Voiturettes: 1, Latil. The second day's event was a race from Draguignan to Cogolin and back, a distance of 127 miles. The winner was M. Chouchard on his Panhard racer, who, starting at 9.30, arrived back at 11.26 a.m.

AT a recent meeting of the Rhode Island Automobile Club Mr. Joseph P. Manton entertained the members with a description of a steam carriage which he built in 1866. This was the first horseless carriage seen in Providence, U.S.A., which, it is claimed, had a speed of fifteen miles an hour. It was not very practical, as sufficient fuel could not be carried to run it any great distance. The coal was carried under the seat. A large boiler was used and required considerable coal and water. The carriage was used for some months by Mr. Manton, but the great difficulty was the unsurmountable fuel arrangements which rendered the carriage unfit for everyday use.

CORRESPONDENCE.

SUGGESTIONS TO BEGINNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had considerable experience with machinery of various sorts, both in business and pleasure, and having bought a motor-car a year or so ago, I have lately added much to what had gone before. As I notice some of your readers frequently give their experience and views on motor-cars, perhaps you will be able to find space for mine. Motor-car builders, to make their vehicles a success, have to produce machines that can go both in rain and sunshine, winter and summer, over rough country roads, up hill and down, through mud and dust—and keep going. The machinery must be easy of access, so that it can be thoroughly cleaned when necessary, and examined to see if in perfect order; in case of breakage, broken parts must be easily replaced by any ordinary machinist. They must not be lightly built, but have sufficient weight to stand all kinds of rough usage they are sure to encounter in use. As, in my opinion, weight *versus* power cuts no figure, too much avoirdupois is better than too little. The machinery should be covered everywhere where grease or oil is used, or friction occurs, to exclude the dust and dirt; otherwise serious cutting cannot be avoided. All nuts and bolts should be locked to prevent losing them. All machines vibrate, in spite of manufacturers' statements to the contrary, and, in time, cause these movable parts to get out of place. Simplicity and directness of action of mechanical parts should be the object sought by all manufacturers, with a view to increased utility and durability. Builders should first test their vehicles under the most adverse conditions before putting them on the market. Those using electricity in the operation of their motors should be sure that the wiring will stand all kinds of weather without grounding, that it is protected from grease and petrol, and that as much as possible all tendency to break from vibration is provided against. A competent electrical authority's advice should be procured when planning this part of the machine, and not the cheapest wire and the easiest way be selected, as is so frequently the case now.

The would-be automobilist, before he makes the plunge and invests, should first realise that he knows nothing about a motor-car, and, before buying, should thoroughly investigate all the systems offered for sale; get all the experience he can from his friends who have already tried; learn of the defects and advantages of the vehicles that various individual manufacturers may produce, and then endeavour to find a car that combines the greatest number of good and the least number of objectionable points.

The would-be motorist must start carefully and thoroughly learn all parts of his machine before venturing too far away from "home and mother." He should know when he hears some new sound or squeak, and at once locate it, and be so thoroughly familiar with the outside and inside of his motor that he knows when it is not working right, and what is necessary to make it do so. This experience and knowledge cannot be acquired in a minute, and can only be gained by patience and study. Don't let any one touch the engine or other machinery in your car unless you know his knowledge is greater than your own. A motor-car will not run itself, and while it does not require to be fed, like a horse, it demands as careful grooming, and either the owner or experienced employes must do this.—Yours truly,

JAMES WILKINSON.

THE NESSELSDORF STEERING GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—In your issue of April 20th there appears a letter from the Nesselsdorfer Wagenbau-Fabriks-Gesellschaft, in which I am asked to give proof that my steering gear is identical with theirs. The different cases I have to adapt my gear to require, it may be, a slight difference in the design, and that represented as being the invention of our Austrian friends is one among a number of designs of mine. The proof, however, is to be definitely ascertained by a reference to my patent specifications. The

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

British patent is dated May 11th, 1892, and the official number is 8,905; the German patent is dated April 15th, 1893, and the official number is 71,381.

The particular application of my invention is something that I have a right to control, I take it, and it is novel to me to have my statement doubted when it was backed up with proof that this gear had been fitted by me for steamships for eight years past. If your correspondents will be good enough to procure a copy of my specification from the Patent Office, and study the illustration set forth there, and also read the claim, they will soon see that my claim is too sound for any shadow of dispute. I offered my explanation to your readers previously in no hostile spirit, but merely to point out that the said invention was not new or novel, as I had held the patent rights since the date given above.

I trust this explanation will be satisfactory, as any other explanation would require the assistance of a British jury.—

Yours truly,

J. J. KERMODE.

THE MOTOR RACE AT BRIGHTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your issue of April 27th Mr. R. Dennis writes to say that he won the five miles motor race at Brighton by 2½ laps. I beg to inform you that this is not the case, for, as a matter of fact, I won the first prize on a 1½ h.p. Werner bicycle, Mr. Dennis being disqualified. I may add that the objection was not lodged against him by me. He finished half a lap in front, not 2½ as Mr. Dennis states.—Yours truly,

T. H. TESSIER.

THE LOMBARD MOTOR-COOLING DEVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the motor-cooling device which was described in your issue of 20th April I am of the opinion from experiments which I made some three years ago that such a method of reducing the temperature of the cylinder is not very successful. The introduction of water into the cylinder of an internal combustion engine weakens the explosion of the charge, and in most cases prevents the charge taking fire at all. The presence of water vapour in the cylinder even in very small quantities is very detrimental to the economical working of the engine and is to be avoided as much as possible. The drier the cylinder the more rapid and perfect is the combustion with a corresponding increase in the power developed by the engine. I have no doubt that many of your readers have obtained similar results and I should be very pleased to hear from any on this interesting subject.—Yours truly,

RAYMOND WHITELEY.

TRICYCLE AND TRAILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A correspondent signing himself "Indignant" has, like myself, been charged £2 2s. by the Inland Revenue for a tricycle and trailer. The Hampshire magistrates have decided that they are two carriages, and the tax is 15s. each. I have asked to be refunded for the two years overcharge that I have paid.—Yours truly,

HAMPSHIRE.

A SUGGESTED MOTOR-CAR SERVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“A Frequent Visitor” suggests an opening for a motor public service; and, without wishing to offer any opinion as to the route he mentions, I cannot help thinking that he would have done a greater service if he could have pointed out a really suitable car for public service. As one who has for two years been connected with the motor-car hiring business, I have been looking for such a car, but without success. The only type so far available commercially is the 6 h.p. Daimler. Now these vehicles at the most do not carry more than ten persons beyond the driver, and even at that are very heavily loaded on a hilly route; against this the ordinary two-horse omnibus carries twenty-four persons. These little vehicles are expected to earn wages for

driver and conductor and make up the very heavy charges for interest and depreciation on first cost, and at the same time show a profit over the horse-drawn vehicle; and when they fail to do so the blame is laid upon the makers of the cars, drivers, anyone and anything, the promoters owning ignorance of the question they try to solve. Those automobilists who have an open or latent objection to electric tramways should restrain their animosity until some practicable form of public service motor-car is upon the market, and in the meantime welcome any form of mechanical traction on the roads.—Yours faithfully,

FRANK SHEPPARD.

RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter in your last issue from “Steam,” his letter loses a great deal of its interest from the fact that he assumes that the motor of a racing Panhard weighs 25½ cwt. It is the complete motor and motor-carriage that weighs this, according to Mr. Mayhew’s notes, although on this point the printers do not seem to have made it quite clear. The weight of the latest 70 h.p. Napier oil engine is 700lb., and I think no steam boiler and engine can come anywhere near this.—Yours truly,

S. F. EDGE.

THE GERMAN AUTOMOBILE INDUSTRY.

THE annual report of the Union of Berlin Merchants and Industrials states that the German automobile industry has gained in extent and importance during the past year, although the sales in the home market have not kept pace with the technical improvements. The public in Germany, while taking a constantly increasing interest in the substitution of mechanical for animal power in the transportation of goods and passengers, remains at the moment reticent as a buyer, and is confirmed in its position by the inferiority of the many ephemeral products with which the market is flooded. The result of this reticence is that a number of concerns which, on account of insufficient financial backing, were dependent upon an immediate disposal of their products were forced to suspend operations during the year. The larger automobile manufacturers, on the other hand, made a successful bid for business in foreign countries, especially in England and France. Orders from these countries are so important that the greater part of the production of the coming year is covered by them.

The extended trials which the German military authorities made with automobiles as dispatch vehicles during the last manoeuvres have proved very satisfactory. The experience thus far gained justifies the expectation that the crying need of the army of a substitution for horses by mechanical power, especially for the propulsion of the ever-growing “trains,” can be satisfied through the placing in commission of a large number of motor-vehicles. Nevertheless the change will probably only be made when another propulsive medium than petrol or steam can be made use of. The objection to petrol is that the raw material is not a domestic product in Germany and its regular supply is therefore not to be relied upon; against the application of steam it may be urged that too much of the carrying capacity of the vehicles would be required by the large quantities of fuel that would have to be carried and that the replenishing of the water supply would cause considerable delays. Everything seems to point to the conclusion that as long as no fundamental changes occur in the application of electricity to automobile purposes, alcohol is destined to gain the most in favour among the common sources of motive power. The practical difficulties which have so far been in the way of the application of ordinary denaturated alcohol may be regarded as practically overcome. Stationary and portable alcohol motors are already doing good service in industrial and trade establishments and have also been introduced with success in agricultural work. An increased use of alcohol would give an important agricultural industry a long desired market and at the same time a great impetus to the automobile industry itself.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

JOTTINGS BY A WORLDLING.

IN reading Taine's splendid study of Shakespeare the other day I came across the following quotation from Esquirol, the great alienist:—"L'homme est une *machine* nerveuse, gouvernée par un tempérament, disposée aux hallucinations, emportée par des *passions* sans *frein*, déraisonnable par *essence*, mélange de l'animal et du poète, ayant le verve pour esprit, la sensibilité pour vertu, l'imagination pour *ressort* et guide, et conduite au hasard par les circonstances les plus déterminées et les plus complexes à la douleur, au crime, à la démence et à la mort." The italics are mine, and mark the words we use currently to-day in our automobile talk. It is curious to find so many of them in one sentence that is over a hundred years old.

I DROVE down on Sunday to lunch at the White Lion, Cobham, the proprietor of which most excellent inn is an ardent automobilist and the owner of an Ariel tricycle. On the way I saw a large Décauville going splendidly, several tricycles, three or four De Dion voituresses, a big Daimler with about sixteen very lively passengers, a Stanley steamer, a Darracq and a Benz in difficulties, and last, but not least, a racing Panhard, doing, *dure et auspice* Mark Mayhew, its twelve miles an hour without difficulty.

I STRONGLY advise people who want to see the finish of the Gordon-Bennett Cup to go out to Bordeaux by the General Steam Navigation Company's boat that leaves London at three o'clock on Saturday, the 25th inst. I am going that way myself because I know it to be most comfortable and very cheap. The best place to see the race from is on the road out from Angoulême towards Barbézieux.

OF course it is very nice to have a "real, live lord" in the motor-car industry, particularly when he is premier earl of England and Ireland and a thoroughly good sportsman to boot. But this is no excuse for a contemporary's talking of "His Grace of Shrewsbury and Talbot, whose ducal coronet graces (no pun intended) most of the London hansom cabs." Furthermore, I do not think there are many hansoms about to-day with the S. and T. monogram and the "eight pearls mounted on high golden rays."

IT is a perfectly shameful thing that we should have weather like this in May. I had arranged a short tour to start on Wednesday, but I woke up to see a yellowish fog and read in my paper terrible tales of snowstorms in Devonshire, the warmest part in England. It would not surprise me a bit if the Gordon-Bennett Cup race were run, like an historical Derby, in a snowstorm, and if the Bay were to be horribly rough.

SOMEBODY ought to suggest to Sir Thomas Lipton to have a land "Shamrock" built to challenge for the Cup next year. It ought to be built by Georges Richard, but, of course, that cannot be. I suppose the day will come when people will be as keen about our races as they are about any other sporting event; but it is not with us yet.

I WENT up to the Exhibition at the Agricultural Hall the other day and it seemed to me to be a success in every sense of the word. The trade must have benefited by it greatly if one may judge by the numbers of the right sort of visitors there, the majority of whom were on business intent. Most of the men I met seemed thoroughly pleased with the Show. Among those who told me that they intended to get cars immediately were Mr. Panmure Gordon, the Stock Exchange magnate; Mr. W. C. Taylor, of lawn-tennis fame; Mr. Charles Bois, who was there with his sister and Miss Saunders, Mr. Ernest Hill, Mr. Chadwick, Mr. Anderson, Captain Ernest de la Pature, who is still very lame, Mr. Eustace Williams, and Baron von Ruhl. Mr. C. N. Williamson and Captain Simpson are changing their Benzs for bigger cars.

I WAS very disappointed at not seeing any of the Gordon-Bennett cars at the Show, because, as my readers will have found out by now, I take an inordinate interest in racing. The questions I asked about them were not received with any enthusiasm by the representatives of the Motor Manufacturing and Motor Power Companies, who only gave me *non possumus* answers. In a round-about way I was "credibly informed" that the Motor Manufacturing Company car is a *voiture légère* of about 8 cwt., with four 5 h.p. English-made De Dion motors coupled. This certainly sounds like speed, but I should think the engine would be difficult to drive.

DRIVING into Windsor from Bagshot, the other day, nearly had a bad accident, owing to the fact that the Park gates were shut without any light to show that they barred the road. The way in which I had to slam on my brakes did my tires no good. This should be seen to at once; a lamp in the middle would cost very little money and practically no trouble.

MONSIEUR DE BREYNE, who happily got over his attack of scarlet fever very quickly, drove me down from the Exhibition to Walsingham House on his new *tonneau* double-cylinder Pieper. The little car went extremely well and, I should say, is fairly fast. At a reasonable price it should become very popular.

AN EARLY CANADIAN STEAM VEHICLE.

M R. CHARLES BAILLAIRGE, of Quebec, writes to the *Canadian Electrical News* describing a steam wagon he built in 1844. "While Trevethick's motor was a single engined one without a fly-wheel to get it over the "dead points" when it happened at an impediment in the roadway, my machine was a double cylindered one, whereby the cranks on the axle being at 90 degrees apart, the dead points were got over by one of the pistons being only half way on its travel, while the other was at the turning point and thus capable of exerting a force necessary to overcome any inequality in the paving or macadam. The twin engines were of the ordinary "working beam" type, with parallel bars at one end engaging the cross-head of the piston rod working in guides as usual, while as connecting rod at the opposite end of the oscillating or working beam engaged the crank on the axle or shaft of the vehicle on which the wheels of the automotor were mounted, a third wheel of less diameter, and capable of running in under the carriage to which it was attached by a bar turning on a swivel, was used to steer the wagon and turn it when required end for end in a radius of a few feet. This vehicle, as stated, I built in 1844, working at it after hours and on holidays, as I was then a pupil in the Quebec Seminary. I was helped at it by another boy, one Frederick Holt who lost his life at the fire of an old Quebec theatre. It may be foolish now to say so, but I was ever so much pleased when on letting steam into the cylinders for the first time, I found I had placed the eccentrics so exactly as not to require their position to be altered in the least to admit and cut off steam at the absolute moment of time necessary to prevent any loss of power whatever by back pressure. The two engines were built entirely by ourselves, including the drilling of every hole and the making of every screw, bolt and nut in the whole concern; while all we got done by outsiders were the boiler, a horizontal one, some two feet in diameter and three feet long, with a 15-inch fire flue within it, and the three wheels, which we had made by a regular wheelwright. The cylinders were, I believe, about three inches inside diameter or less, and some 8 or 9 inches long, the pair developing under steam at 30 lbs. pressure about 1 h.p. or more, which drove us along the road at from eight to nine miles per hour, the weight upon the driving or bearing wheels being hardly more than 1,200 to 1,500 lbs. all told, and with from two to four persons in the vehicle. The vehicle was nothing but a rectangular box-like construction of some four feet wide and six feet in length: the boiler being at the centre and the twin-beam engines on either side of it. The boiler was so raised that the crank-shaft and axle of the wagon rode beneath it from wheel to wheel. A standard with cross-head rose from the front wheel for steering."

THE Motor-Car Exhibition at the Agricultural Hall.

Photo by]

A GROUP OF CARS IN THE ARENA.

[Argent Archer.

DESPITE the counter attractions of Saturday last, the opening day of the annual exhibition of the Automobile Club at the Agricultural Hall, Islington, N., was a great success. There was no formal ceremony, but in a quiet, unostentatious way, to the accompaniment of the blowing of horns and the tinkling of bells, the turnstiles were set going, and during the whole of the week they have been revolving in a very pleasing way. Not only have the public attended; but that section of it which contemplates purchase as well as evinces curiosity has been present—a fact to gladden the hearts of exhibitors and give confidence to those firms that had not previously occupied space in the great Hall.

Entering from the Upper Street, Islington, the well-filled arcade prepares the visitor for a busy scene on entering the main building, on the ground floor of which hundreds of motor-cars stand stationary, while others career round the arena with all the vigour of the chariots of old. This year the Minor Hall to the right of the principal entrance is occupied, and there the Queen's Victrollette, a biograph reproduction of the 1,000 miles non-stop run at the Crystal Palace, and Madame Lockert's display of posters—a portion of which is in the Gallery—attract attention. For the first time, too, the exhibits have overflowed to the Gallery, and the several stands located there should be visited by all who go to the Hall during the remaining hours that the Exhibition will be open. It closes at 10 p.m. on Saturday, the 11th, and great crowds are expected all day.

As in previous years, the arena seems to present a scene of never-failing interest. Passengers are numerous, and there is none of that diffidence on the part of the public which was

observable on the first occasion that Mr. C. Cordingley afforded motorists such a fine chance of displaying their skill in driving and the power of control they possess over their cars. These exhibitions are overcoming prejudice and begetting confidence; and from confidence to custom is a step that the persuasive eloquence of exhibitors can overcome in the case of most people whose pockets have the necessary length.

Last week we suggested a few novelties, etc., that would be present, and the forecast has been amply fulfilled. In fact, the excellent efforts put forth by exhibitors to have their stands ready by noon on Saturday led to a completeness on the opening day which is not usually associated with such displays. Only a few firms were laggard in this respect, the great majority having exerted themselves to present a good appearance to the buyers who put in an early appearance. The representatives of the newspaper press were quickly astir on Saturday, and just as the early bird is said to catch the worm, so the exhibitors who were ready got the newspaper paragraph that is not without value in these days when advertising is necessary—even for such an innovation on our common roads as the motor-car.

Below we commence the publication of a complete record of the Exhibition in which are noted the new features and the prominent exhibits. There are no startling deviations from the practice of recent months, and probably the universal favour attained by the *tonneau* body is the most characteristic impression of the whole display. In a very few years the Exhibition will certainly attain international dimensions; it has already gained much of that character, as the representative exhibits from America, France, Germany, and Belgium testify.

Stand No. 1, which is one of the largest in the show, is that of the Motor Manufacturing Company, Limited, of Coventry, a range of cars and motors of exceptional interest being staged. To deal first with the cars, we find a Granville wagonette with detachable omnibus top of the type which is now being used for public service purposes in various parts of the country. The

FIG. 1.—THE M.M.C. 7 H.P. TONNEAU.

general arrangement is similar to that in the well-known type of Panhard and Daimler cars, it being driven by a two-cylinder engine of 6 h.p., and having four speeds forward and reverse. Next we come to a 10 h.p. *tonneau* car, painted in heliotrope, dark red and black lines, it is adapted to seat five persons, an ingenious arrangement of combined rear door and seat being adopted. The artillery road wheels of this vehicle are shod with solid rubber tires. The engine, by the way, is of the gravity feed type, and is fitted with both tube and electric ignition. A very neat 7 h.p. *tonneau* next attracts attention, the body being comfortably upholstered and painted in dark green with light green lines. The frame of this vehicle is fitted with what is termed a "fitch plate," which is claimed to add to the elasticity and strength. The engine is of the pressure feed type, the change speed gear giving four speeds ahead and reverse. The 10 h.p. Marlborough phaeton to seat six is a car which is attracting considerable attention. Finished in yellow and black, the driver is protected by a glass screen in front. We now come to a neat *tonneau* having a body finished in red and black, and imitation basket work. This car, which is fitted with a 7 h.p. gravity feed engine, is adapted to seat six persons. It is fitted with a new style of motor bonnet, which lifts entirely away, and in the front of which the radiating coil is located. We give an illustration of this car in Fig. 1. A 10 h.p. phaeton, built for Mr. G. D. Newton, of St. Neots, a 6 h.p. nine-seated omnibus, and a 7 h.p. four-seated "Chariotee" are also to be seen; while there are also two 12 h.p. phaetons, one finished in dark green and gold, and one in heliotrope. The latter has several times been taken round the arena, where its quiet and smooth running has been very noticeable. The engine, which develops 15 h.p. on the brake, is fitted with both tube and electric ignition, foot pedal accelerator; Brampton roller chains transmit the power

to the rear road wheels, to which Clipper pneumatic tires are fitted. These cars can, it is claimed, attain a speed of forty miles per hour. The M.M.C. Miniature Panhard on exhibit has already been fully described in the *Journal*, so that it need only be said that it is driven by a $5\frac{1}{2}$ h.p. M.M.C. De Dion motor, and that it has three speeds forward and reverse (the gear wheels, by the way, being always in mesh). It may also be mentioned that the artillery road wheels are shod with Collier pneumatic tires. Perhaps the most interesting novelty on the stand is the light car (Fig. 2) fitted with a slow-speed vertical two-cylinder motor of 7 h.p. Outwardly the car resembles the Miniature Panhard; it has three speeds forward and reverse, controlled by two levers. The change speed gear wheels are always in mesh, the change of gear being obtained by means of a sliding feather. The body of the car takes the form of a comfortable *tonneau*, and either solid or pneumatic tires can be fitted to the road wheels, which are of the artillery type. The regulation inclined wheel steering is fitted, while ample brake power is provided. The car complete weighs about 12 cwt., and should meet with a large adoption. Reference must not be omitted to the Werner $1\frac{1}{4}$ h.p. motor-bicycle, which when not on the stand has been ridden round the arena by Mr. Leonard. To conclude our description of this stand, we may call attention to the big display of M.M.C.

petrol motors, ranging from a $2\frac{3}{4}$ h.p. air-cooled one of the De Dion type up to a 24 h.p. four-cylinder one of the Daimler type, which can develop up to 30 h.p.

"Anti-Rustine" is, as its name implies, a compound which defies the action of that arch enemy to all machinery—rust. Messrs. M. McCoy, of the Phoenix Works, Phoenix Place, London, W.C., make this their sole exhibit. It is also useful as a cleanser, leaving a bright polish when removed. Sold in tins at sixpence and a shilling it is certainly worth a trial, which will probably lead to its finding a permanent place on every well-turned out motor-car.

FIG. 2.—THE M.M.C. 7 H.P. LIGHT CAR.

Writing of cleansing reminds us of another preparation exhibited by the Zamol Syndicate, Limited, Palace Chambers, Westminster, S.W. "Zamol" is its name, and its chief use to the motorist will be the removal of stains from hands or clothing after cleaning his machine. It may also be used for many domestic purposes, and unlike many preparations for similar purposes, is free from offensive odour, a slight and refreshing

scent of ammonia being all the most delicate nose can detect. "Clenveet" is a duster exhibited by the same syndicate, which has the peculiar property of really removing dust, which adheres to, it in preference to depositing itself in some other and equally undesirable place.

An interesting stand is that of the Daimler Motor Company, Limited, of Coventry. An inspection of it, under

FIG. 3.—FRONT ELEVATION DAIMLER "KIMBERLEY" CAR.

the able guidance of Mr. P. Richardson, shows that considerable progress has been made by this company during the past year. At the last Show, if we remember rightly, the highest-powered car was a 12 h.p.; while this year the first vehicle to meet one's gaze is the Hon. J. Scott-Montagu's 25 b.h.p. four-cylinder car, with racing body, the owner having kindly lent it to the Daimler Company for the exhibition. This vehicle, which has covered a distance of one mile in but fifty-eight seconds, embodies all the latest improvements, including roller bearings and ball thrusts, and pressure lubrication to all parts except the road wheels. The engine is of the gravity feed type, and is fitted with both tube and electric ignition. The question of brake power has been well attended to, while Clipper pneumatic tires, of large diameter, render the vehicle exceedingly easy riding. Passing along we come to a couple of 18 h.p. Daimler *tonneau* and *tonneau phaeton* cars, one of which belongs to Mr. J. D. Siddeley, the managing director of the Clipper Tire Company, Limited. The Daimler *tonneau* has the rear seats arranged each in semicircular form, with arm-rests for the passengers, practically forming two comfortable arm-chairs. Both cars are driven by four-cylinder 18 h.p. Daimler motors, with the latest form of valves, and are fitted with both tube and electric ignition, capable of united or separate employment. In connection with the electric ignition, a double switch and spare accumulator are provided, so that should one battery give out the other can be switched on instantly. The Daimler forced lubrication, with sight feeds on dashboards, and roller bearings with ball thrust bearings, are other features of the cars. Inclined steering pillars with worm and wheel steering of the irreversible character are furnished. The cars have two brakes each—a double band brake on the countershaft, pedal applied, having a water-cooled drum, and powerful compensating band brakes on the sprocket rings, lever applied. Both vehicles run on artillery wheels shod with large section pneumatic tires. A feature of one of the 18 h.p. cars is the adjustable driving seat, the back of the seat being arranged so that it can be fixed at any position

within, of course, a certain range. The next vehicle is a 9 h.p. Marseilles *tonneau phaeton*, with front hood, and with ample and comfortable accommodation for four persons. This car is driven by a two-cylinder engine of 9 h.p., having both tube and electrical ignition. The radiator for cooling is carried in the front of the vehicle, while a new departure in the engine is the fitting of the inlet and exhaust valves on opposite sides of the cylinder heads. Foot and hand accelerators are fitted, as also the Daimler pressure lubrication, to all parts, except the road wheels. Clincher pneumatic tires are provided, while the carriage body, which was built in the Daimler Company's works, is comfortably upholstered. We next encounter a Coventry wagonette, capable of seating six comfortably, the vehicle being driven by a 6½ h.p. two-cylinder motor, having tube ignition, with fittings for electric if desired. The Daimler pressure lubrication is employed, the sight feed lubricators being placed on the dashboard. The gear, which is of the usual type, gives four forward and reverse speeds, of four, eight, twelve, and sixteen miles per hour. Hand and foot accelerators are fitted, and three brakes—one a band brake on the countershaft, pedal applied, and the others compensating band brakes acting on drums, forming part of the sprocket wheels, applied by side lever. The car is carried on artillery wood wheels shod with 2½ in. solid rubber tires. A new 6½ h.p. Daimler *tonneau phaeton*, to carry four, with its body by Messrs. Mulliner, in aluminium, has attracted considerable attention, and is driven by the latest pattern two-cylinder engine, having tube ignition and provision for fitting electric. The gear affords four speeds forward and reverse. Every detail has been taken care of in the fitting up of the body, little useful pockets being contrived in several places in the *tonneau*. The last car to call for notice is the 4½ h.p. Kimberley (Figs. 3 and 4), which has already been described in the *Journal*. It has a Ralli dogcart body, with seating capacity for two, and space beneath seats and at rear for baggage. The two-cylinder engine is located in front, as usual, and drives the rear axle by a single belt and spur gearing, three speeds up to eighteen miles per hour, and one reverse, being available. Steering is controlled by a hand wheel at the right of the driver. The car complete weighs about 12 cwt., and with cycle-type wheels and pneumatic tires makes a comfortable riding vehicle. Three brakes are available, while an arrangement is provided whereby the driving belt can be tightened when necessary without the driver having to descend from the car. Finally we may refer to a 6 h.p. Daimler launch engine, fitted with forward and reverse gear, suitable for a 36 ft. boat, and the now well-known full-size section of the Daimler engine and transmission gear, which latter, by the way, has seen 10,000 miles use.

FIG. 4.—PLAN OF DAIMLER "KIMBERLEY" CAR.

Messrs. Friswell, Limited, of 48, Holborn Viaduct, London E.C., have a large exhibit. First we notice a Mors Petit Duc fitted with a 5 h.p. motor and *tonneau* body; a 4½ h.p. De Dion *tonneau*, with water tank under a bonnet in front; an ordinary 4½ h.p. De Dion voiturette, a light American two-seated steam-car known as the "Milwaukee," and a 7 h.p. two-cylinder

Peugeot car, the engine of which has both tube and electrical ignition. The Peugeot vehicles are now too well known in motoring circles to need a long description, but reference may be made to the huge 20 h.p. racing car of this type which Mr. Friswell has driven round the arena several times, and which, we are informed, has attained a speed, on French roads, of fifty-eight miles per hour. A new French light car to the English market

FIG. 5.—THE "TORPEDO" CAR.

is the Vehel, which is being introduced into this country under the name "Torpedo." The car (Fig. 5) is fitted with a *tonneau* body, but a three-seated spider or phaeton body can be fitted if necessary. The motor is of the vertical single-cylinder type with water-jacket and electrical ignition, capable of developing 6 h.p. Located under a bonnet in the fore part of the frame it drives the rear axle through a train of gears and duplicate sets of chains and chain wheels in a way very similar to that adopted in the Panhard cars. Three speeds forward and one reverse are provided, the change of speed being controlled by a hand lever at the side. The crankshaft and the variable gear run in oil-containing cases; the engine is provided with a governor, in conjunction with which is an "accelerator" operated by a pedal. Steering is controlled by an inclined hand wheel, while both hand and foot brakes are provided. The water circulation is maintained by a pump and radiator, a feature being the provision in front of the dashboard of a gauge glass, by means of which the driver can tell at a glance whether the pump is working; while another noticeable point is the neat way in which the "taps" controlling the electric ignition and the carburettor are grouped around the steering column. The weight complete is given as below 9 cwt. One of the "Vehel" cars with four persons up is said to have made the journey between Paris and Orleans in four hours.

FIG. 6.—THE PEUGEOT 8 H.P. HANSOM CAB.

Well located along one side of the Minor Hall is the stand of the British Automobile Commercial Syndicate, Limited, 97-98, Long Acre, W.C. Here no attempt has been made to introduce new cars, but the company has restricted its exhibit to some of the best-known vehicles in which it deals; the central

carriage being a 12 h.p. Panhard et Levassor phaeton, fitted with tube and electric ignition, the whole surmounted with a canopy. This has been sold to the Earl of Shrewsbury and Talbot, who during the fortnight preceding the exhibition travelled more than 900 miles on the vehicle without any break-

FIG. 7.—THE BROWN MOTOR-COUPÉ.

downs whatsoever. A Peugeot hansom cab of striking appearance is another attractive exhibit. The motor is of 8 h.p., and the illustration (Fig. 6) will enable readers to readily identify the vehicle when it is seen on the streets. A 16 h.p. Panhard with *tonneau* body, a 5 h.p. De Dion-Bouton voiturette of the *vis-a-vis* type, a 5 h.p. De Dion voiturette with a "Mylord" body, and a 4½ h.p. De Dion car complete an exhibit which represents some of the best French workmanship. The British Automobile Commercial Syndicate, Limited, has a complete repair shop to deal with automobiles, and at its *garage* is able to stable and store cars with every convenience.

The leading exhibit on the stands of Messrs. Brown Bros., Limited, Great Eastern Street, London, E.C., is the Brown petrol light cars. The motor and mechanism are mounted on independent frames, so that any type of carriage body can be fitted—*tonneau*, spider, phaeton, two-seated, etc. An attractive little vehicle is the one fitted with closed coupé body (Fig. 7), with spider seat at the rear. The inclined steering wheel and control levers are all inside the coupé, the driver, although covered, having an uninterrupted view. In fine weather the door and cover can be removed, converting the car into an open spider. The motive power in the cars on view is supplied by a 6½ h.p. Aster water-cooled motor, but a 4½ h.p. De Dion can be had if desired. Electrical ignition is provided, while there are three speeds forward and a reverse motion, the transmission being much on

FIG. 8.—THE BROWN MOTOR-BICYCLE.

the lines of that adopted in the Renault and Darracq light cars, that is to say, the power is transmitted direct to the rear live axle from the variable speed gear box through a universal-jointed longitudinal shaft and bevel gearing. Three brakes are provided, while the wooden road wheels

are shod with Clipper-Michelin pneumatic tires. Messrs. Brown Bros. have lately taken up the agency for the Locomobile, and a couple of these well-known steam vehicles are to be seen on their stand. We now come to another novelty, the Brown motor-bicycle. The machine itself is built up of B.S.A. parts and has a specially strengthened head and duplex

FIG. 9.—THE NEW ORLEANS LIGHT CARRIAGE (GEAR-DRIVEN).

front forks—not shown in Fig. 8. The engine, a small air-cooled petrol motor developing $1\frac{1}{2}$ h.p., is, as will be seen, supported on the top of the lower cross tube of the frame, the crank chamber being at the bottom bracket. Messrs. Brown claim that by placing the engine in this position the frame is really strengthened than otherwise, the whole being exceedingly rigid. A combined petrol tank and surface carburettor is employed, this having a capacity sufficient for a run of eighty miles. The ignition is electrical, by coil and accumulators, a switch in one of the grips of the handle bar breaking the circuit at will. The power of the engine is conveyed to the rear wheel by a strap working on light pulleys, a small adjustable pulley being provided by means of which the tension of the driving belt can be regulated. The engine is started by pedalling the machine, a free-wheel clutch in the rear hub permitting the rider to cease pedalling as soon as the motor is in operation. The machine was examined and was fitted with a Bowden rim-brake to the rear wheel, but we understand that a brake acting on the front wheel will also be provided. The machine, which weighs complete 75 lbs., can attain a speed of thirty miles per hour on good roads. Messrs. Brown Bros. inform us that in addition to supplying motor-bicycles complete they are arranging to supply the motor and its fittings to cycle makers, so that the latter may furnish motor-bicycles to order. In addition to the foregoing Messrs. Brown Bros. made a display of motor-tricycles and quadricycles, trailing cars, De Dion motors, motor-car chains and chain wheels, horns, bells, lamps, and accessories of every kind for automobilists and motor-vehicle builders. Among the latter we may specially mention a new three-speed gear and the BB induction coil, which has a brass case instead of one of vulcanite, the change being claimed to overcome the danger of breakage and of short circuiting.

We have been greatly impressed during the week with the quiet running of the New Orleans voiturette exhibited by the New Orleans Motor Co., Ltd., of Twickenham. This is another car which has been illustrated and described in these columns, so that but a brief description will suffice at the present time. The motor is a single-cylinder one of $3\frac{1}{2}$ h.p., with electric ignition, and cooled by means of a fan driven from the periphery of the flywheel. The power is transmitted from the motor-shaft to the countershaft by a crossed belt. On the countershaft are three wood pulleys, that on the left hand side being the fast speed, the centre the loose, and that on the right hand the slow-speed pulley. The last named is carried on the countershaft and the fast-speed pulley on a sleeve, upon which the loose pulley runs. The two speeds are obtained by spur and pinion gear wheels, which are always in mesh. The car, which is fitted with two brakes, is provided with a simple and ingenious method of taking up the slack of the belt by means of a lever placed conveniently in front of the driver. A very useful improvement is to be found in a new form of striking gear, which enables the driver to stop the car by using a pedal the same as on the Panhard and Daimler.

Of the belt-driven cars, three are shown—a two-seated one, a two-seated vehicle with lengthened wheel base, and a three-seated car. Considerable interest is being shown in the New Orleans gear-driven light car, which made its appearance at Easter, and which has been alluded to in these columns. The vehicle, of which we give an illustration in Fig. 9, is driven by a 7 h.p. two-cylinder water-cooled engine, located in the fore part of the frame. The whole of the moving parts are

FIG. 10.—THE HUMBER CAR (see page 169).

entirely cased in and run in oil. The transmission from the motor is by means of a live shaft through a special clutch and change speed gear, giving three speeds forward and one reverse, direct longitudinal shaft and bevel gearing to the rear axle. Two brakes are fitted, one acting on main shaft and a band brake acting in both directions on wheels.

A good deal has been heard during the past few months of the Gobron-Brillié motor-cars by reason of the fact that the engines with which they are fitted are claimed to be not only able to work without alteration with either petroleum spirit or alcohol, but also that they are practically free from vibration. It is not, therefore, surprising that the stand of Messrs. Botwoods, of Woodbridge Road, Ipswich, who are introducing these cars into this country under the name "Teras," should be receiving great attention at the hands of visitors to the show. There are a number of special features in the Gobron-Brillié cars, but as these have been illustrated and described in detail in the *Motor-Car Journal* a brief résumé is only necessary at the present time. Of the large type of cars Messrs. Botwood have brought two to the Show—a 12 h.p. char-a-banc and a six-seated 12 h.p. wagonette. To enable visitors to inspect the details they have wisely included in their exhibits a complete *chassis* without body (Fig. 12), in which the motor and mechanism can be readily inspected, and as the difference between the two cars above referred to is only one of carriage-builders' work—which, by the way, appears to be well carried out—

FIG. 11. THE "TERAS" MOTOR.

the following particulars may be taken as applying to both vehicles. The engine (Fig. 11), which is located at the rear of the frame, is of the vertical type; while there are only two cylinders there are four pistons, the explosions taking place between them. The piston rods of the upper pair are attached to a cross-head, which in turn are connected by side levers to the crankshaft below, the arrangement being claimed to overcome the difficulty of vibration. Electrical ignition is adopted, while the ordinary carburettor is replaced by a cone, on the face of which are cut out a number of small buckets or "aveoles"; this cone is seated into another cone in which the first revolves in such a manner that the buckets are filled with petrol, which is drawn into the explosion chamber at a further portion of the revolution. This measurer is rotated by a small ratchet actuated by a hit-and-miss lever on the governor shaft, in such a manner that absolutely no more petrol is consumed than the exact quantity required. A governor, operated by a small handle, is also provided, regulating not only the air supply and advance of electric spark, but also controlling the supply of the petrol through the positive feed. All the working parts of the motor are securely inclosed in an aluminium dust-proof box. The speed of the motor may be regulated by the aforementioned handle on the steering pillar to any speed between 250 and 1,300 revolutions per minute.

The cylinders are water-cooled, a pump and radiator being fitted. The inlet and exhaust valves are situated one above the other, and by removing a single bolt the two pairs of valves can be quickly taken out. Three speeds and a reverse motion are provided. A large spur-wheel on the engine shaft gears with a pinion on a countershaft, which carries, in an oil-containing box, a train of

FIG. 12. ELEVATION AND PLAN OF "TERAS" 12 H.P. FRAME.

spur wheels, any one of which can be brought into gear with corresponding wheels on the parallel differential shaft, from which two chains transmit the power to the rear road wheels. The reverse motion is obtained by means of a small pinion which can be interposed between the two gears giving the low speed. The gears are generally calculated for speeds of thirty, eighteen, or eight miles per hour, with the motor making one thousand revolutions, but, owing to the control that the driver has over the governor, any intermediate speed can be obtained. There is a powerful brake on the differential shaft operated by a pedal. There are also two powerful double-acting band brakes on the hubs of the rear road wheels actuated by a lever at the right-hand side of the driver. These, however, are seldom used except in case of emergency or when the car is left standing on a hill. The usual sprag for use when ascending very steep inclines is also provided. Steering is controlled by a horizontal hand wheel; the car is practically self-steering, for the hands may—although, in our opinion, this is not desirable—be removed from the steering wheel while the car is running and it will steer straight ahead, while in turning corners the front wheels will automatically

FIG. 13. THE "TERAS" 8 H.P. DUC-TONNEAU.

come back to the straight. The steering, moreover, is geared down on a new principle, which does away with any fatigue which might be experienced when driving on a rough road. The driver has either under his hand or foot all the levers to regulate the driving and control of the carriage. Immediately under the steering wheel are situated three little handles, one for

changing the gear, one for reverse movement, the other controlling the electric ignition, air and petrol supply; while on the right hand side of the car is the lever of the emergency brakes. Under the left foot is the pedal working the clutch, under the right foot the pedal working the brake. The body is fastened to the frame by six bolts, which can be undone in a few minutes, and the body of the carriage changed if desired. The frame is constructed entirely of steel tubes on a triangulated principle,

FIG. 14.—THE "DIANA" CAR.

giving great strength and rigidity. The road wheels are of the artillery type, shod with pneumatic or solid rubber tires, at the desire of the purchaser. The petrol tank is located under the seat and has a capacity sufficient for 100 miles; the water tank, which holds seven gallons, is placed in the front of the frame. Very little water is, however, used, Messrs. Botwood informing us that after a run of 500 miles it was found that only four pints of water had been used. To meet the demand for a low-built light car the firm have also introduced a 8 h.p. *Duc tonneau* (Fig. 13). This car, which in general arrangement follows the line adopted in the Darracq and Renault vehicles, was illustrated and described in our report of the recent Automobile Exhibition in Paris. We may mention, however, that it is fitted with a Gobron-Brillié two-cylinder four-piston balanced motor, giving 8 h.p., located under a bonnet in the fore part of a tubular frame. Like the 12 h.p. engine it has electrical ignition, special petrol feed in place of carburettor, water-circulating pump and radiator. The power of the motor is transmitted to the change-speed gear, which gives three speeds forward and a reverse, a universally jointed shaft and bevel gearing conveying the motion from the gear box to the rear live axle. Inclined wheel steering is fitted; one lever controls the ignition, the petrol feed and the governor; there are three levers at the right side of the driver, one for the brakes, one for the change speed gear, and one for the reverse motion. The four-seated *tonneau* body is finished in natural wood and is comfortably upholstered, the artillery road wheels being shod with pneumatic tires, the whole forming an attractive vehicle which is likely to become very popular in this country.

Two cars are shown by Messrs. Lewis and Lewis, of Townmead Road, Fulham. The car (Fig. 14) which is being introduced into this country under the name "Diana," follows, generally speaking, the lines adopted in the Benz cars. The engine, a horizontal one of 4 h.p. in one case and 6 h.p. in the other, is located in the rear of the frame. The cylinder is water-jacketed, the circulation being on the thermo-syphon system; a radiating coil is provided. Three speeds forward, ranging from four to twenty miles per hour, are available. The power of the engine is transmitted by two belts, working on fast and loose pulleys, to a countershaft, from which it is conveyed to the rear axle by a duplicate set of sprocket wheels and Brampton chains; the low speed is obtained by means of a Crypto gear. The car is fitted with special band-brakes to the hubs of the rear wheels, they acting equally well whether the car is running in a forward or backward direction. The crank chamber of the engine is closed in, and the crank pin is lubricated from a sight-feed lubricator by means of a hollow ring outside the crank and an oil hole through the centre of the crank pin; a half compression cam and a starting handle are used for starting the engine.

The belts are shifted from fast to loose pulley, and from medium to top speed, by a special arrangement, using one handle only. The countershaft runs in swinging brackets, which can be drawn forward by tension screws to tighten the belts and chains. A sight-feed lubricator with four outlets is fixed at the back of the cars. The starting handle, water-filling plug, and petrol-filling plug are all accessible on the outside without opening the back cover. The coach work is of strong construction and upholstered in leather. The cars, which are fitted with wood wheels and pneumatic tyres, weigh about 11 cwt., and can attain a speed of twenty miles an hour.

The Sports Motor Car Company, of 103, Fulham Road, London, S.W., have this year a most varied and interesting exhibition. First we have a couple of the well-known Mayfair voituresses fitted with 3½ h.p. De Dion water-cooled engines, electric ignition, pump and radiator, inclined wheel steering, two independent brakes. This car will, it is claimed, climb any hill of 1 in 10 with a full load at ten miles an hour. Close by are a couple of similar cars, except that they are fitted with De Dion engines of 4½ h.p. and specially strong frames. Two speeds are available by means of a single belt and spur gearing. One of these vehicles is specially adapted for doctor's use, being fitted with a hood. A new car of interest is the Sports 4½ h.p. *tonneau* to carry four persons. Three speeds ahead and one reverse are obtained by a single belt, gear wheels and one chain to the live axle. The vehicle is fitted up on up-to-date lines, with inclined wheel steering and radiator; while a useful feature is that the engine can be set in motion from the driver's seat. The car complete weighs about 7 cwt., and can attain a speed of twenty-eight miles per hour. An American phaeton with 8 h.p. motor is also shown. The engine is of the two-cylinder horizontal type, the piston rods working on to a central crank shaft. The speed gear is arranged to give four speeds forward and one reverse, the transmission being direct to the rear axle by bevel gearing. Quite a new car is the "Sports" 9 h.p. car, the frame carrying the whole of the transmission gear so that any form of carriage body can be fitted; the illustration (Fig. 15) showing a *tonneau*. It is driven by a 9 h.p. two-cylinder water-cooled vertical motor, in which both the induction valves and the exhaust valves are well surrounded with water jackets, and are readily accessible by the removal of a single nut. The circulation is maintained by a pump and radiator. A Sthenos carburettor is employed, and the normal speed of the engine is 1,200 revolutions per minute. The car is gear driven by means of longitudinally-set Panhard type of gearing, and a universally-jointed shaft and bevel gearing on to the rear axle. It has four speeds forward and one reverse, all controlled by one lever. It is provided with three brakes—one pedal applied on the countershaft, and one

FIG. 15.—THE "SPORTS" 9 H.P. TONNEAU.

on each of the rear wheel hubs applied by hand lever in the usual way. Wheel steering with inclined steering pillar is fitted. The water tank which is situated beneath the front seat has a capacity sufficient for a run of 120 miles. The *tonneau* body is very commodious, and the car is altogether nicely finished; its weight complete is about 9 cwt. Those on the look out for a good light car at a relatively low price should not overlook the Sports Company's stand.

An entirely new car to the English market is the "Ader," made by the Société Industrielle des Telephones, of Paris, and introduced into this country by Messrs. G.A. Nussbaum and Company, 29, Ludgate Hill, London, E.C. Two cars on are view—one a spider (Fig. 16) and one a *tonneau*, the only difference being in the body. Working upon the "Otto" cycle, the 6 h.p. motor (Fig. 18) has two cylinders set at an angle of 90 degs. The diameter of the cylinders is $3\frac{1}{2}$ in. by $3\frac{1}{2}$ in. stroke, the normal speed being from 1,200 to 1,500 revolutions per minute. The piston-rods are attached to the same point of the crank shaft, which carries a couple of flywheels, the whole encased in an aluminium gear-box. The explosions are produced by the ordinary system of electric ignition. The system of water-cooling adopted presents some novel features. The water which is contained in the cylinder jackets is, under the action of the heat, changed into steam, and as such passes into a condenser, which is a copper tank cooled by flanges fixed to the motor shaft. In the form of water it falls then into a small reservoir, then passes into another similar receptacle, and finally mounts again by means of pulso-meters into the cylinder water-jackets. The pulso-meters are india-rubber membranes, to which the differences of pressure in the motor base-chamber give an oscillating movement, and thereby cause the water to ascend. The frame of the car is built up of two parts, the one rectangular, the other triangular. The

FIG. 16.—THE ADER LIGHT CAR.

front axle forms the base of the triangle, of which the apex rests on the rear side of the rectangular portion of the frame. This latter is sustained by the back axles. Under normal conditions the planes of these two parts blend, but they can incline, the one upon the other, so giving to the car great suppleness, and assuring easy travelling over the most irregular of roads. The motor itself is carried in the fore-part of the frame, while the carburettor, petrol tank, accumulators, and induction coils are all stowed away beneath the driver's seat. An induction coil for each cylinder is used. The motor drives a shaft which carries at its extremity a friction clutch and also a small pulley, the latter being fitted on its rim with a series of springs, by the intermediary of which the propulsive effort is transmitted to the wheels. With such an arrangement any sudden shock which the car may receive while travelling is only communicated to the cylinders after the springs have deadened the greater part of the blow. It is on this kind of little pulley that the flanges for cooling the condenser are fitted. There are three forward speeds and a separate reverse motion. The transmission of the propulsive effort is finally completed by means of a differential and ordinary duplicate pair of chains. The pipe connecting the motor to the exhaust box passes through another and larger tube, so heating the air which is drawn in through the latter to the carburettor. The car is fitted with

two brakes. The first, which is a hand-brake, acts upon the rear wheels, while the second, operated by a pedal, is connected to the differential. The application of either produces exactly the same effects: (1) To disconnect the friction clutch; (2) to cut off all but sufficient explosive mixture to keep the motor running, thus minimising vibration and economising petrol; (3) to apply one or other of the brakes. Cycle type road wheels and pneumatic tires are fitted, while the steering is con-

FIG. 17.—PLAN OF ADER LIGHT CAR.

trolled by a horizontal hand wheel. The car complete weighs about 7 cwt., and can attain a speed of from thirty to thirty-five miles per hour.

The Automobile Manufacturing Company, Limited, of Long Acre, W.C., have a fine array of cars of the latest pattern, including an 8 h.p. Panhard with four-cylinder motor and latest type of transmission gear, also a 6 h.p. Mors Petit Duc. A car which is attracting much attention is the identical Darracq racer which won the race at Pau in February last. It is fitted with a two-cylinder engine of 12 h.p., capable of doing thirty-eight miles an hour on a give-and-take road, the maximum speed being fifty-five miles per hour. Another interesting item is the chassis, or complete frame, of the new 8 h.p. Darracq car, which, in addition to being of greater power than the well-known type, is longer in wheel base and of correspondingly increased strength to the wearing parts. A car which should appeal to doctors is the "Richard," fitted with a hansom cab top and glass front, the latter being removable. This vehicle is driven by a 5 h.p. water-cooled vertical engine located in the front part of the vehicle. The transmission is by means of a single belt and spur gearing direct on to the rear axle, three speeds ahead and one reverse being available. The road wheels are of the cycle type and fitted with pneumatic tires. There are two brakes under the control of the driver, the little vehicle being well worthy of inspection. Those on the look out for a little vehicle at a relatively low price, should inspect the Delin car (Fig. 19)

FIG. 18.—SECTIONAL ELEVATION OF ADER MOTOR.

on this stand. The car is made by La Société des Usines Delin, of Louvain, Belgium. The frame is of tubular construction, in the fore-part of which, under a bonnet, is fixed a $3\frac{1}{2}$ h.p. motor. This is fitted with radial ribs to the cylinder and a water-cooled head, the circulation being on the thermo-siphon system. The power is transmitted by a chain to the counter-

shaft, which is fitted with a variable-speed gear giving two speeds forward and reverse; from the countershaft a centrally-located chain transmits the power to the rear differential axle. On the level the car can attain a speed of twenty miles an hour.

FIG. 19.—THE DELIN VOITURETTE.

while on the low gear it will, it is claimed, mount any hill, it having been successfully tested on the steep thoroughfare in Brussels known as the Montagne de la Cour. A pedal-operated clutch is interposed between the engine and the transmission gear, so that the former can be thrown out of gear at will. Wheel steering, cycle type wheels, and pneumatic tires go to complete an attractive little car weighing between five and six cwt. Passing by a Minerva motor-bicycle, we come to a handsome Serpollet steam car of 8 h.p., fitted with a four-seated phaeton body similar to that being built for the King. Of accessories and motor parts a wide selection is offered, among which were many spare parts for Panhard and Peugeot cars, a lifting jack which, while weighing only 20 ozs., will lift 5 cwt., and a new foot-operated signal bell.

A very fine display is made by Messrs. De Dion Bouton, Limited, of 14, Regent Street, London, S.W., no less than five of the well-known De Dion voiturettes being staged. Prominent among these is a car with a well-finished Mylord body, built for Mr. T. H. Weguelin, an elegant phaeton with detachable canopy, leather wind-shield, and plate-glass screen in the front, which is detachable independently, and a *tonneau* in dark blue with imitation motor bonnet in front. All these vehicles are fitted with a water-cooled engine, with electric ignition, developing $4\frac{1}{2}$ h.p. This makes the car suitable for carrying four persons and enables it to be driven up any hill on an ordinary main road

Under favourable conditions a speed of twenty-six miles an hour can be maintained, and ordinary hills can be taken on top speed. In addition to a larger engine, the cars are now fitted with a reversing gear. The frames of the cars are formed of weldless steel tubing; on these frames bodies of various designs are fitted to suit the tastes or requirements of purchasers. The carriage is hung on easy springs. Band brakes are fitted—one acting on the balance gear, and one on drums on each of the driving wheels. The length of the carriage over all is 8 ft., and the width 4 ft. 4 in. The weight is about 800 lbs. A new exhaust regulator enables the driver to make the engine run more quietly when in traffic or stationary. It is also claimed to effect an economy in the amount of petrol consumed. The engine is cooled by water carried in a tank in the front of the car, and circulated by means of a pump, driven by the engine through radiators suspended between the front wheels. It is almost impossible to make a mistake with the change speed gear. By pulling the lever back the low gear is brought into action; by pushing it forward the high gear is engaged; whilst in

the middle position the engine is out of gear with the driving wheels. Up-river motorists will be interested in the De Dion $4\frac{1}{2}$ in. water engine, mounted, together with a gear giving two speeds ahead and one astern, an aluminium base plate ready to be fitted into a boat. The De Dion Company are having one of these combinations fitted

FIG. 20.—THE DE DION LAUNCH MOTOR.

to a boat and hope to have it at work shortly. An illustration of the launch engine complete with speed gear is given in Fig. 20.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

The Roadway Autocar Company, Ltd., of 44, Berners Street, London, W., have, in addition to an array of accessories, four different makes of cars on view—the Mors, the Renault, and the Bardon petrol vehicles, and a new electrical automobile. Dealing first with the Mors type, the trend of the times is to be seen in a couple of 6 h.p. light cars fitted with the popular *tonneau* body, one being finished in green and black and one in white and black. In these vehicles (Fig. 21) the power is supplied by a two-cylinder water-cooled engine, the cylinders being placed opposite to one another across the front of the frame, so that the

FIG. 21.—THE MORS 6 H.P. PETIT DUC.

two piston rods work on to the central crankshaft. The ignition spark is furnished by the Mors arrangement of dynamo and accumulators, while a governor and radiating coil are also provided. Three speeds forward and a reverse motion are available, the engine transmitting its power through a friction-clutch to the variable gear box, located towards the rear of the frame (Fig. 22). From the differential countershaft duplicate sets of chains and chain wheels convey the power to the rear road wheels. Steering is controlled by a bar, somewhat on the lines of those used on cycles; the road wheels are of the artillery wood type and shod with pneumatic tires. Ample brake power is provided, there being altogether three brakes. Two cars shown on this stand which are attracting attention are the 10 h.p. and 16 h.p. Mors cars (Fig. 23), both fitted with *tonneaux*. As the general arrangement in the two vehicles is identical one description will suffice. The engine in both cars consists of four vertical cylinders, the circulation being maintained by a pump and radiator. The cylinders in the 10 h.p. engine have radiating flanges to the cylinder walls and water-cooled combustion chambers, while in the 16 h.p. motor the water-jacket extends around both the head and walls of the cylinders. The ignition is effected by means of a dynamo and accumulators, while a pedal-operated accelerator acting on the governor and a small handle on the steering column regulating the gas admission are available. From the engine the power is transmitted through a clutch to the variable-speed gear box, which is adapted to give four

FIG. 22.—PLAN OF MORS 6 H.P. PETIT DUC.

speeds forward and reverse, the forward motion being controlled by one lever and the reverse by another. Bevel gearing connects the change-speed gear countershaft with the differential shaft, which in turn is connected to the rear road wheels by the usual duplicate set of chains and chain wheels. Ample brake power, inclined wheel steering,

artillery wooden wheels, and pneumatic tires are all part and parcel of the Mors 10 h.p. and 16 h.p. cars, to which, being built with standard frames, any type of carriage body can be fitted. It will be remembered that the Hon. C. S. Rolls has now a 24 h.p. car of this firm's make, and his selection speaks volumes for the reputation the Mors cars have earned in the motor world, as well in this country as in France. Of the Renault light cars little need be said, they being one of the best-known types of the kind on the market. One of the cars on show has a *tonneau* body, another that of a three-seated spider, while one, known as the Doctor's car (Fig. 24), has a detachable top with glass front, the rear riders being entirely enclosed. The cars are equipped with $4\frac{1}{2}$ h.p. De Dion motors of the latest type, with pedal-controlled exhaust lifter for quietening or slowing down the engine. Another car, shown for the first time in this country, is the Bardon; this is of French construction, and has been illustrated and described in the *Journal*. The car on exhibition is a *tonneau*, neatly finished in blue with primrose wheels. It is fitted with a special 5 h.p. horizontal engine. As will be seen from the plan view (Fig. 25), the engine is placed transversely on the frame, and has only one cylinder but two pistons, the explosion chamber being in the centre. Four fly-wheels are employed. The peculiar construction and arrangement of the engine and working parts render the car almost entirely free from vibration. The transmission is effected by a combination

FIG. 23.—THE MORS 16 H.P. CAR.

of gear and chain driving, three speeds forward and a reverse motion being available. Three brakes are provided, and with inclined wheel steering, wood wheels, and pneumatic tires the car is at once both comfortable and speedy, as well as a good hill climber. The Roadway Company are also introducing a new electrical car, one of which they have on view. This is a five-seated cabriolet, capable, it is claimed, of travelling fifty miles on one charge of the battery, which consists of forty four accumulators. The car is equipped with two electric motors, geared direct, one each to the rear road wheels. The controller is adapted to give three speeds forward (three, six, and twelve miles on hour) and the same number in a reverse direction, the latter being controlled by a heel pedal. The wooden road wheels are shod with Diamond single tube pneumatic tires, while both hand and foot operated brakes are fitted. Complete, the car weighs about a ton. Out of the many motor accessories shown we may refer to a new acetylene headlight known as the Phare Ducellier. This will burn for five hours on one charge and throws a powerful light in the front of the car. Samples are also shown of the R.A.C. sparking plug, of which we hear very good accounts. The plug is of short and stout construction, which is claimed to prevent fracture of the porcelains. Should, however, the porcelains become cracked, they can be quickly replaced. The two porcelains and the whole internal parts are mechanically held without cement of any kind, and by unloosening the lock-nut the whole of the parts collapse. No sealing matter or cement is employed, so that the frequent troubles arising from short circuiting are overcome, the joints being made by mica and asbestos washers. The spark passes between two conically shaped platinum points, so that the

insulators may be turned round without affecting the spark. The two points are of best platinum, while the sparking end of the insulator is rounded and easily cleaned, the return electrode being brazed in.

FIG. 24.—THE RENAULT DOCTOR'S CAR.

Considerable attention is being centred on the new light car of Messrs. Humber, Limited, Coventry, of which four are exhibited—three *tonneaux* (Fig. 10, page 163) and one a three-seated body. As in each the motor and general arrangement of the transmission gear are identical, one description will suffice. To deal first with the frame, on which the whole structure is built, this is of tubular construction, a feature being that the longitudinal tubes extend the whole length of the frame, being braced together by cross tubes which are not split, but which are connected to the longitudinal tubes by lugs on the latter. The motor, which is located under a bonnet in the fore part of the frame, is a genuine French De Dion $4\frac{1}{2}$ h.p. of the latest pattern. It is fitted with the exhaust valve closer, by which the speed of the engine can be regulated to the greatest nicety. The ignition is electrical, and it is worthy of remark that, the batteries and coil being close to the engine, long lengths of wiring are avoided, thus minimising the possibility of short circuiting. The carburettor is De Dion's latest development of the well-known float feed type; the air supply being heated from the exhaust pipe. The engine is, of course, water-cooled, the water circulation arrangements comprising a gear driven pump and a radiator. The water tank is located under the bonnet in front of the dash board, while the petrol and lubricating oil tank is carried behind the dash. Before leaving this part of the car, reference may well be made to the ease with which the motor and its various accessories may be inspected. By simply undoing two screws the radiator, which is hinged, can be let down in front, and the bonnet, also hinged, can be turned upwards, thus laying open to view the whole of the engine, carburettor, batteries, water tank, sparking plug and trembler, and all the electric wiring and connections. This does not necessitate the stopping of the engine, as the cooling water can freely circulate through the radiator even when it is swung down. Coming now to the transmission gear, two forward and two reverse speeds are provided by means of a change-speed gear of the De Dion type; both are operated by one hand-lever, the movement being the same in both cases, with the addition of a foot-pedal to change the gear from forward to backward direction. The speeds attainable are up to twenty-five miles per hour on the level, and from six to eight miles per hour on stiff hills. These can also be regulated by varying the mixture, by advancing or retarding the sparking, or by the exhaust valve closer, previously referred to. The power is transmitted from the variable speed gear box to the rear driving axle by means of a longitudinal

shaft with universal joints and bevel gearing. The brake system consists of, first, a pedal manipulated from the driver's seat, actuating a hand brake on the longitudinal shaft, and secondly, a lever moving along a notched plate to the right of the driver, and operating two powerful hand brakes on the hubs of the rear road wheels. The steering is of the irreversible type, the same as used on racing cars. The steering wheel is a special feature, it consists of a ring of steel tubing covered with leather, placed centrally over the steering column, to which it is attached by only one arm. In this way the driver has free access through the top of the wheel to the levers regulating the petrol and ignition, these levers being brought close up to the top of the wheel. The arrangement is certainly an ingenious and convenient one. The road wheels are 28 in. dia., with 3 in. pneumatic tires, all four wheels being the same diameter, and fitted with the same size of tires; the latter are thus interchangeable, a single spare tube and cover being all that it is necessary to take on a tour. The carriage work of the vehicles is handsomely and comfortably finished, while the *tonneau* has plenty of leg room for two passengers. The *tonneau* or spider seat can be quickly detached and the space utilised for luggage, thus affording an excellent touring car for two persons. Complete, the vehicle weighs about 9 cwt. Mr. Craig, of the Humber Company, informs us that the car has been subjected to extensive trials, which have resulted so satisfactorily that arrangements are now in hand for the construction of the Humber car in series.

There are only four cars on the stand of the Motor Power Company, Limited, 14, Regent Street, London, S.W., but as each one represents a different type of automobile, it is one worthy of close inspection. First, we have a replica of the car in which the writer made a trip to Brighton in the early part of the year—a 16 h.p. Napier car, kindly lent by Mr. Roger Fuller. The details of these vehicles are now so well known that it is not necessary to go into them at length on the present occasion. Suffice it to say that the motive power is supplied by a petroleum-spirit engine, comprising four water-jacketed cylinders, which develop 24 h.p. on the brake. Two independent sets of powerful hand brakes are fitted. One set is operated by hand by means of a lever on the right side of the driver, the other set being operated by the driver's foot; in the latter case the drum is cooled by water, so that there is no chance of it heating and destroying the fibre of the brake strap. Either of these brakes, when applied, is more than sufficiently powerful to prevent the car moving backwards on the steepest hill, should it be necessary to stop on a declivity. Roller bearings are fitted to the working

FIG. 25.—PLAN OF BARDON CAR.

parts, while to reduce weight aluminium is used wherever possible. The carriage work of the car is of the highest class; the body is of the *tonneau* type, the back portion being built up to the same height as the front seat. Strong road wheels of the artillery type are fitted, and these are shod with 90 mm. and 120 mm. Clipper-Michelin pneumatic tires. The 9 h.p. Napier car to be seen is practically identical with the higher-powered one, except that it is fitted with a two-cylinder engine developing

10½ to 12 h.p. on the brake. Electrical ignition by means of accumulators and coil is employed. It will be remembered that the first car of this type was the "Sir Charles" of Mr. E. Kennard, J.P., which competed in the 1,000 miles Trial last year. Passing from the Napier cars, which are now well known in the automobile world, we come to the Gladiator light car, a vehicle of French construction, and for which the Motor Power Company are the agents in this country. This is a powerful little car (Fig. 26), and is fitted with a single-cylinder vertical petrol motor of the Aster type developing 6½ h.p.; the cylinder is water-cooled, having a jacket over the whole of the cylinder, the water circulation being ensured by a rotary pump driven off the fly wheel. The water tank holds about three gallons of water, and with the radiators provided the water is kept cool for a great length of time. The ignition is electrical, being generated by accumulators and an induction coil placed in a box under the driver's seat. The speed of the engine is, as usual, controlled by advancing or retarding the electrical ignition. The carburettor is of the float-feed constant level type. The petrol reservoir, which holds about three gallons of spirit, is placed under the seat. A small reservoir for lubricating oil is set on the dashboard so that the engine can be lubricated at will, when running, from the driver's seat, thus obviating any necessity for stopping for this purpose. The engine is set in the front of the car under a bonnet, the same as in all the best known big carriages. From the engine the power is transmitted through a pedal-operated friction clutch

FIG. 26.—THE GLADIATOR LIGHT CAR.

to a variable gear of the Panhard type, giving three distinct changes of speed and a reversing gear, thus combining a good speed on the level with ample hill-climbing powers on the lower gears. The change of gear is effected by means of a small hand lever placed beside the driver, and under his immediate control. From the variable speed gear box the power is conveyed by a longitudinal shaft, through bevel gearing, to a differential countershaft, on the ends of which are sprocket wheels, these being connected with chain wheels on the rear wheel hubs by two chains. Irreversible inclined wheel steering is fitted, the wheel being on the right hand under the control of the driver, within whose reach are also placed the driving and braking mechanism. The road wheels are of the wooden artillery type, and are shod with pneumatic tires. The body, which is of the now well-known *tonneau* shape, has seating capacity for four people, the frame being hung both at the back and the front on laminated C springs, so that comfortable riding is ensured. There are two distinct sets of brakes, one being actuated by the right foot and acting on drums on the hubs of the driving wheels, the other being actuated by a hand lever and acting on a large drum on the countershaft. The weight of the car when in going order, with water and petrol tanks filled, etc., is 10½ cwt., while the overall measurements are, length, 7ft. 6 ins.; width, 4ft. 6 ins.; height, 4 ft. 3 ins. Finally we come to the 3½ h.p. Gladiator voiturette, a small car adapted for two persons. The frame of the car is built up of steel tubes, and is suspended on the axle by plate springs. The motive power is supplied by an Aster 3½ h.p. water-cooled engine located in the front part of

the frame. The ignition is electrical, the carburettor is of the Longuemare type, while the water circulation is maintained by a small pump, a radiating coil also being provided. The power of the motor is transmitted to a countershaft by a chain, a friction clutch and a two-speed gear (giving 22 and 8½ miles per hour) being provided. From the variable-speed countershaft a centrally-located chain transmits the power to the rear axle.

FIG. 27.—PLAN OF "EMPRESS" CAR.

Steering is controlled by an inclined hand-wheel, on which is fitted the electrical switch, while the remaining control levers are fixed on the steering standard. Three brakes are provided, while the petrol tank has a capacity sufficient for a run of 125 miles. Complete this little car weighs about 4½ cwt.

The United Motor Industries, Limited, 64, Holborn Viaduct, E.C., have a comprehensive display of parts and accessories, amid which the "Empress" light car fitted with a *tonneau* body has a conspicuous place. This car, of which we give a plan view in Fig. 27, is fitted with a 4½ h.p. De Dion-Bouton motor, three speeds forward and a reverse, and a special direct transmission. The range of lamps, reservoirs, horns, driving aprons, baskets, etc., is most complete, and among other exhibits of interest we notice the "Reclus" sparking plugs, the "D" lubricating oil for De Dion motors, the "P" lubricating oil for Panhard cars, the "Mercié" gear, the "Brissard" water-cooled combustion chamber, the "U.M.I." speed changing gear, and a folding toolbag of good design and great convenience. On this stand there is also a collection of worm steering gears, differential gears for cars up to 25 h.p., and of gears from the Paris Show. The "Dupont" two-speed gear with free clutch is also shown (Fig. 28). In this the pinions are always in gear, and are hermetically inclosed in a case filled with grease, thus keeping them free from dust and dirt while securing con-

FIG. 28.—THE "DUPONT" GEAR WITH FRICTION CLUTCH.

tinuous lubrication. A "U.M.I." frame with three speeds and a reverse, differential gear and steering complete, clutch, axles, springs and hubs, complete, one of the most comprehensive displays in the Exhibition. On this stand there is something of interest to every visitor.

High-speed petrol motors, which have been given the name "Kelecom," are a speciality of Messrs. Antoine, Fils and Company, of Liege, Belgium. They are of both the air and water-cooled vertical type. The air-cooled engine is of $2\frac{1}{2}$ h.p., and runs at a normal speed of 1,800 revolutions per minute, the weight

FIG. 29.—THE ANTOINE 8-H.P. MOTOR.

coming out at 60 lbs. Of the water-cooled motors two sizes are to be seen—a single cylinder engine giving 4 h.p., and a two-cylinder one of 8 h.p. (Fig. 29). The former runs at 1,600 revolutions and weighs 105 lbs.; while the normal speed of the double-cylinder engine is 1,400. The inlet and exhaust valves are located one above the other in such a way that they can be readily removed. In the larger engines, the suction valve is so arranged that the inlet pipe can be set at any angle. All the engines have electrical ignition, with special contact breaker, while a centrifugal governor acting on the inlet valve and driven off the crank shaft, is fitted. Messrs. Antoine are also making a special centrifugal water-circulating pump (Fig. 30), suitable for engines up to 8 h.p., the weight of the pump being only $4\frac{1}{2}$ lbs.

FIG. 30.—THE "KELECOM" PUMP.

The Collier twin tire (Fig. 31) for motor-vehicles is being shown by the Collier Tire Company, Limited, Camp Road, St. Albans. In this tire the canvas walls of the tire parts are carried underneath and vulcanised in the usual way. Part is used to form an arm on each side, or tread to hold the rubber in its place. These arms are then laced together by ligatures passing

right through the rubber tread. Consequently, the rubber tread is helped by a triple force, viz., the vulcanisation to the canvas, the arms, which terminate in a beading, and the ligatures, which pass through the rubber tread from one arm to the other. This latter is the special point, and one upon which the makers rightly lay great stress. It is claimed that in this combination of a pneumatic and solid tire the narrow tread makes the tire a fast one, and results in very little dust being made, while skidding is greatly minimised. The special form of fastening adopted prevents creeping, thus removing the chief cause of the bursting of the inner tube.

The largely-used Benz motor-cars are kept well to the front by Messrs. Hewetson, Limited, of 251, Tottenham Court Road, London, W., who have nearly a dozen cars of different types on view. It is difficult to say much that is not already known of these cars. The various details have, however, been modified and strengthened as experience has shown to be necessary, the result being a neat carriage, which is well intended to maintain the already great popularity of this firm. Glancing at the cars on the stand, we first notice a vehicle intended for doctors' use. It is intended to seat two persons and is fitted with a detachable hansom cab top, so that the riders may be protected in bad weather. The car is fitted with a $3\frac{1}{2}$ h.p. horizontal engine with electrical ignition. Three speeds, obtained by means of belts working on fast and loose pulleys, are available, the vehicle being capable of maintaining an average speed of sixteen miles per

FIG. 31.—SECTION OF COLLIER TIRE.

hour. A $3\frac{1}{2}$ h.p. belt-driven Benz dog cart, with seating accommodation for three persons, is next seen, close by which is a three-seated car fitted with a $3\frac{1}{2}$ h.p. engine, the feature being that gear transmission is adopted in place of belts. Three speeds are provided as also a reverse motion. A useful car is that with seating accommodation for three persons, and with a $4\frac{1}{2}$ h.p. engine fitted with electrical ignition, water circulating pump and radiator. This is a gear-driven vehicle, there being four different speeds available as well as a reverse motion. The car on exhibition is fitted with wooden wheels and a useful hood for use in bad weather. Another style of Benz car is to be seen in the one fitted with a twin-cylinder engine giving 6 h.p. This is of the gear-driven type, and can attain a speed, on good roads, of thirty-five miles per hour. Coming to the higher powered cars, we notice a four-seated belt-driven dog-cart, fitted with a double-cylinder engine. This vehicle has three speeds forward and reverse motion; it weighs about 19 cwt., and can attain a speed of twenty-four miles per hour. At the time we visited the stand, Messrs. Hewetson

were expecting a 10 h.p. four-seated "Emperor" car. This has already been illustrated in the *Journal*, but we may mention that it is of the gear-driven type, the engine having two cylinders set opposite to one another and working on to the same crank shaft. Finally, we may refer to the Benz $3\frac{1}{2}$ h.p. light delivery van to be seen at the back of the stand. This little vehicle has, we are informed, been in use for the last three and a-half years, and, like "Charley's Aunt," is "still running."

Accumulators or secondary batteries for spark ignition on motor-tricycles and cars form the leading speciality of Messrs. Peto and Radford, Limited, 57B, Hatton Garden, E.C. The batteries give a flaming spark of great capacity; they are made in several sizes, ranging from 4 ampère-hour capacity up to 50 ampère-hours. The tricycle size has, it is stated, a capacity sufficient for a run of 500 miles, after which they can be re-charged at a small cost. The accumulator consists of an ebonite box divided into two compartments. Each compartment is fitted with positive and negative plates, separated by ebonite rods. Conspicuous on their stand is a primary battery for re-charging accumulators at home, sal ammoniac being the only addition necessary, the use of other agents being obviated. The "Dinin" accumulator, with which the name of the firm has long been associated in this country, is also shown; while a

FIG. 32.—THE CELLULOID ACCUMULATOR.

distinct novelty is to be seen in storage batteries for motor-tricycles in celluloid cases (Fig. 32). Being transparent they secure a great advantage for the rider.

The novelty on the stand of the Star Motor Company, Wolverhampton, is a new Star light car with comfortable *tonneau* body. It was only with difficulty that this vehicle was got ready for the Show, and it is well worthy of inspection. The general arrangement is similar to that adopted in the Darracq and Renault cars, the engine being carried in the fore part of the frame under a bonnet. A two-cylinder vertical motor is used to drive the car, this being of 6 h.p., and fitted with electrical ignition and water jackets, the water circulation being maintained by a pump and radiator. Three speeds and a reverse motion are available, the engine transmitting its power through a clutch to a variable speed gear of the Panhard type, and thence by a universally-jointed longitudinal shaft and bevel gearing to the rear live axle. The changespeed gear is operated by a single hand lever, while steering is of the inclined wheel type. The road wheels are of the artillery wood type shod with Dunlop pneumatic tires. A foot pedal actuates a band brake on the driving shaft, while there are emergency band brakes on the hubs of the rear wheels operated by a hand lever. Complete, the car weighs about 11 cwt., and it can attain a speed of thirty miles per hour. The body is well finished, the back of the *tonneau* being brought well up, adding to the comfort of the passengers. In addition, the Star Company stage a couple of their well-known $4\frac{1}{2}$ h.p. belt-driven cars, and one $3\frac{1}{2}$ h.p. of the same type. These have been fully described in the *Journal*, but a modification we may refer to is the fitting of a kind of chimney to the crank chamber of the motor, by means of which the pressure in the chamber is reduced, not only keeping it cool, but also preventing the splashing of the oil.

A good lamp is a necessity in connection with motor-cars, and visitors to the Exhibition find several attractions on the stand of

Messrs Salsbury and Son, of Green Street, Blackfriars, S.E., who make a special feature of light-giving articles. The firm are the British agents for the Dietz paraffin lamps, and are showing samples of the latest improved patterns. For those who prefer an acetylene lamp they are introducing a novelty in an acetylene candle which will fit into an ordinary carriage lamp. Among other exhibits are the new model motor-car lamp, the Salsbury motor-cycle lamp, the Invincible motor-cycle lamp, and an acetylene generator attachment for motor lamps. The firm have introduced a new system of acetylene gas lighting for omnibuses and public vehicles. Two lamps are employed, each giving a 30-candle power light, a total of 60-candle power as against ten obtained with the present methods of lighting public vehicles. The lamps are arranged so as to secure equal diffusion of light in every part of the vehicle. The front lamp throws an exceptionally brilliant light ahead, but at the same time not of such a dazzling nature as to cause any inconvenience to traffic coming in the reverse direction. The rear lamp throws a light which fully illuminates the stairway of the omnibus, the conductor's stand, the step of the omnibus, etc., so that it is impossible for accidents to happen to passengers for lack of light. A new lamp for small cars, the "Essaness voiturette," is being made much of at this stand. The back and front are easily opened to gain access for cleaning, the lamp being held in the socket by screw barrels. The firm have just issued a new list, which is as bright and attractive as the lamps with which it is concerned.

Clincher tires for motor-vehicles are the most interesting of the many exhibits of the North British Rubber Company, Limited, Castle Mills, Edinburgh. Pneumatic Clinchers for motor-cycles and light cars are, we were informed, in ever increasing demand, and those which we inspected were neatly turned out, and suggestive of speed, comfort, and durability. The proof of the pudding is, however, in the eating, but judging from the past there is every reason to believe that the North British Rubber Company will with the tires on view more than hold the position which it has made for itself as the pioneer of rubber tires. The big traction engine wheel which occupies the centre of the company's stand does not claim to be the biggest wheel in existence, but the tire which covers its eighteen feet of circumference is probably the largest yet turned out. Its weight is 640 lbs., and its value £160; it is solid, of course, but so also are many of the tires made by the company even for small cars. Amongst these the "Castle" tire is conspicuous for its solid virtues; being vulcanised to the flat steel surface of the wheel it cannot possibly come off, and will wear to the very rim. Waterproof clothing, rugs, etc., are here also to be found in pleasing variety and good taste.

Naturally the Dunlop Pneumatic Tyre Company, Limited, of Coventry and London, are represented, and in addition to their well-known tires have a motor tire repair outfit which is one of the most compact and useful things of the kind we have seen. Fitted into a remarkably small compass are the necessary tools, etc., to deal with troubles by the way. The patching rubber is packed in neat tin cylindrical boxes, and neatly wrapped with canvas. This new box will be found on many cars during the coming season. The wired-on principle, which has been applied so successfully to motor-cycles and voiturettes, is now being introduced in connection with heavy cars, and these tires will shortly be ready for delivery. Hitherto the company has supplied a thickened edge vulcanised tire of foreign manufacture for large cars; but they are now well equipped to supply British-made wired-on tires, and so do for makers of heavy cars what they have long done with success for those interested in lighter vehicles.

A Locomobile and a New Orleans voiturette find places on a stand occupied by Mr. J. Van Toll, 15A, Netherwood Road, Shepherd's Bush, W. Mr. Van Toll intends to employ his experience in connection with the practical part of motoring in the repair of motor-cars. He will have facilities for storing cars, and in letting cars on hire during the coming season will doubtless find much activity. Such a business should be capable of much development, and Mr. Van Toll may be relied upon to give the necessary qualities that will make for success in that direction.

The Orient Express Car Syndicate, of 1, Princes Road, Holland Park Avenue, London, W., have on view a couple of Orient Express cars, including a *duc* and a three-seated *vis-a-vis*. They are fitted with a 6 h.p. horizontal single cylinder motor. The ignition is magneto-electrical, the cylinders are water-cooled, and the transmission is by means of belts with jockey tighteners. The "Orient Express" cars, which are of German construction, are of elegant design, and by reason of their relatively low cost should become very popular. Three forward speeds and one reverse motion are available, belt transmission being adopted. The speeds are actuated by a jockey pulley, which is pulled down on to the belts by a lever worked by hand. The car is easily driven, the whole of the levers, etc., being close to hand. They are fitted with artillery wood wheels, shod with either pneumatic or solid rubber tires as desired. The belt pulleys are made of aluminium, and, although no pump is usually fitted, provision is made so that one can readily be affixed. The engine is lubricated by a central oiler, actuated from the seat, while a useful feature is that the motor and gearing are protected from dirt and wet by a detachable guard. The cars weigh about 14 cwt., and can attain a speed of from twenty to twenty-five miles per hour. The company have also on view a powerful Canello-Durkopp *tonneau* car having a four-cylinder motor of 16 h.p., fitted with both tube and electric ignition. In addition the "Bergmann" magneto-electric ignition apparatus, which has the advantage over the ordinary magneto that it is rotary. We hope to illustrate and describe this in a later issue.

Messrs. Dennis Brothers, of the Barracks, Guildford, have an array of their "Speed King" motor tricycles, quadricycles, and trailers. The tricycles and quads are fitted with $2\frac{1}{2}$ h.p. De Dion engines, water-cooled, with combination water, oil, and petrol tank and radiator. These machines are fitted with the firm's friction clutch, which is of a wide conical shape, lined with leather, and specially designed to allow a start to be effected without any jar, Mr. Dennis giving us a convincing demonstration of this. A spray carburetter is now supplied on all their machines, and the diamond frame is filled with a tank, the upper part being used for extra petrol, and the lower for accumulators or dry batteries. Three band brakes are fitted, operated by levers beneath the handle-bar. The firm also show a new light car with *tonneau* body on Darracq lines; it is fitted with a 6 h.p. vertical engine in front, Panhard type of gear, and a central transmission shaft engaging by bevel gear with the rear live axle. They have an 8 h.p. car on similar lines, but fitted with a two-cylinder Buchet motor, in hand, which, however, they were not able to finish in time for the Show. Other exhibits include business and pleasure trailing cars for motor-cycles, and a light pony trap of tubular construction.

The Automobile Supply Company, 56, Broad Street, Birmingham, exhibit two vehicles. The first is a Darracq 6 h.p. *tonneau* voiturette of the type which has become very popular in this country. The other is one of the latest Darracq 8 h.p. light cars with long wheel base, the vehicle having been driven up by road from Birmingham.

The Anglo-American Oil Company, Limited., of 22, Billiter Street, London, E.C., exhibit a brand of petrol already famous amongst petroleum-spirit motorists all the world over. In the matter of storage the company meets the most exacting requirements of the Government and motorist. Their two-gallon can, square-shaped, and fitted with a spout applicable to any form of receptacle in such a manner as to practically render spilling of the precious liquor impossible, should find a place on every spirit-propelled car, no matter how valuable space may be. A neat wooden case, holding four of these cans, is, in a larger way, of course, equally convenient. The company's twenty-gallon tank is fitted with pump and sink, any overflow thus finding its way back to the tank, which, like all their vessels, is absolutely airtight.

Messrs. Carless, Capel, and Leonard, of the Hope Chemical Works and Pharos Works, Hackney Wick, N.E., are present with an exhibit of their well-known petrol for petroleum-spirit

motors, also samples of petroleum oils for lighting and heating, etc., and lubricating oils of all kinds. Included among the latter are lubricating oils specially adapted for petrol cars, while the petroleum oils include those of the Lighthouse, Pilot, and Phœbus brands. Among these are special kinds for spirit motors, and a capital "S" oil, which is specially prepared for the lubrication of air-cooled motors or of water-cooled motors running at great speeds. There is also a good collection of petrol storage tanks and receptacles for the conveyance of petrol, oils, etc. One of the attractions at this stand is a patent benzine safety lamp suitable for lighting motor-car houses, or for use in any buildings where inflammable materials are stored. The lamp is constructed on the principle of the Davey safety lamp, which is the interposition of a fine wire gauze between the internal flame and the external atmosphere, the action of the wire gauze being to radiate or dissipate any heat from the flame, and so reducing the temperature much below that necessary for the firing of an explosive mixture of air and petrol vapour. The lamp consists of a double wick raised and lowered from below, and it is ignited by the flame produced by striking a portion of prepared cotton which is carried in a small metal box; the lamp can thus be lit without opening it to the outside air—a very great advantage.

If there has been one stand in the Exhibition that has been sought out more than another it is that of the City and Suburban Electrical Carriage Company, of 6, Denman Street, Piccadilly Circus, London, W. The attraction has been the identical Victoriote which has been supplied to Her Majesty the Queen, and which arrived from Sandringham on Tuesday. This little vehicle has seating accommodation for two persons, and is, naturally, comfortably upholstered, and has silver-plated fittings, electric bell lamps, etc. It is fitted with a single electric motor, located at the rear of a tubular frame, and geared direct to the rear axle. The driving power is obtained from a battery of forty-four accumulators, the capacity of which is equal to run the car at a speed of fifteen miles for three hours. Steering is controlled by a tiller, while the driver has at his left hand a small handle, by the manipulation of which three different speeds forward and two reverse can be obtained. The battery is located in a chest at the rear, and can be recharged *in situ* or taken out. The vehicle is well supported by springs on wooden wheels, shod with 3 in. pneumatic single-tube tires, the result being a quiet, smooth-running car. A couple of brakes give the driver great command over the car, which weighs complete about 12 cwt. An identical car built to the order of Baron Alfred de Rothschild is also staged. Close by is found a car of novel design, a four-wheeled, two-seated grand hansom, with the driver's seat perched up high at the rear. Each of the rear wheels of this car is equipped with an electric motor, energy for which is furnished by a battery of forty-four accumulators. At an average speed of twelve miles per hour, the car can run a distance of thirty-five miles on one charge of the battery. The driver has three speeds ahead and the same astern at his disposal, by means of a small handle, while a tiller controls the front steering wheels. The wooden road vehicles of this car are shod with $2\frac{1}{2}$ in. solid rubber tires. Every attention has been paid to the details, which include electric bells and lamps, even a speaking tube being provided to enable the passengers to communicate with the driver. A landaulette to be seen at this stand is a type of car which is likely to become familiar in the West End, it having seating accommodation for four persons, in addition to the seat for the driver and attendant. This car is driven by a couple of electric motors—one to each of the rear wheels, and with its battery of 44 accumulators can travel a distance of forty miles, on one charge, at an average speed of twelve miles per hour. The vehicle can be quickly converted from a closed to an open carriage, and, being well sprung and fitted with 3 in. pneumatic tires, is a most easy-riding car. The weight complete comes out at about 25 cwt. Another car which has attracted attention, especially when shown in operation in the arena, is a comfortable Victoria, with the driver's seat fixed high up at the rear, leaving

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

an uninterrupted view to the two passengers for which it is tended. This is equipped with two electric motors, and has a capacity of forty miles at a speed of twelve miles per hour on one charge of the battery of forty-four accumulators with which it is provided. While the Victoriette may be termed the "dwarf" of the stand, the fifteen-seated covered omnibus may be regarded as the "giant"; it is intended for hotel or station use. It is arranged to carry eight inside and two out, as well as a quantity of luggage on the roof. On one charge of its battery of forty-four cells, which, by the way, is in this car located in the fore-part, a run of about thirty miles may be made at an average of ten

FIG. 33.—THE COMPOUND PUMP.

miles per hour. Equipped with tiller steering, wood wheels, and 3 in. solid rubber tires, the bus complete weighs just under two tons. All the vehicles are handsomely finished, and now that a big effort is to be made to popularise electric vehicles in this country we expect to see them largely adopted.

A "Compound" foot pump (Fig. 33) stands first and foremost amongst the exhibits of Messrs. Hedley S. Hunt and Co., of 199, Upper Thames Street, London, E.C. The main advantage claimed is rapid inflation of pneumatic tires for motor cycles and cars. Two cylinders working in conjunction, the up stroke of the piston compresses the air of the larger into the smaller; the down stroke forces the compressed air into the tire, and at the same time fills the larger cylinder. A pressure of 150 lbs. is obtained with less effort than is required to work an ordinary pump, and three strokes will inflate the tire of a 28 in. wheel. Indeed, so great is the pressure that the tires of a 20 cwt. car can be inflated without the use of a jack. Another point of some importance is the "instantaneous" connection which enables the pump to be applied to all machines.

The Clarkson and Capel Steam Car Syndicate, Limited, of Deverell Street, Great Dover Street, London, S.E., confine their exhibit mainly to their kerosene burners and radiating condensing tubes. The burner is of the true Bunsen type, and the quantity of air allowed to mix with the oil vapour before combustion can be adjusted to a nicety. The burner is stated to be clean and quiet and burns without smoke or smell. It can be adjusted at will to high or low flame, and can also be arranged for automatic adjustment. On the stand is a Bunsen burner for a 200 h.p. boiler on a river raft belonging to the London County Council. Contrasted with this is a small burner for the Locomobile and other light steam cars, thus enabling users of such vehicles to substitute kerosene or ordinary heavy oil for petrol, and so securing some advantages in economy and rendering it impossible for the burner to light back. The Clarkson and Capel radiating, condensing, and cooling tubes are shown made up in several forms of coils for cooling the jacket water on petrol cars or for condensing the exhaust steam on steam vehicles or stationary steam plant. These are made for tricycles, voiturettes, and cars up to the size of the 50 h.p. racing cars. The tubes are constructed of light copper tube corrugated spirally. On the outside of the tube is wrapped a special coil of tinned electrical wire that is subsequently soldered to the tube. The result is a very light yet strong radiating tube, claimed to be 30 per cent. more efficient than filled tubes of same size length for length. The Clarkson Syndicate have also a light steam car running in the arena, using petrol as fuel instead of the spirit.

Messrs. Anderson, Anderson and Anderson, Limited, 37, Queen Victoria Street, E.C., have an attractive showcase in which are shown numerous specialties in waterproof goods.

Their wind and dust-proof garments are well calculated to please both lady and gentlemen motorists, and among their novelties is an "automobile kilt," which affords ample protection for the knees and seat. It opens at the side, a wide lap affording ample protection from wind or rain. Knee rugs and aprons in box-cloth, rubber, leather, and oilskin are also shown, as well as the firm's "anti-vibrate" cushions for motoring. A good selection of indiarubber mats and waterproof covers for motor vehicles completes a very representative display in the arcade.

Messrs. Brampton Bros., Ltd., of Oliver Street Works, Birmingham, have on view specimens of their block and roller chains for motor-cars. These are now so largely used by motor-car builders in this country and on the Continent as to render any lengthy description unnecessary. Mention should, however, be made of a chain which is on their stand, having been made to an unusual specification. It has a 4 in. pitch, the rollers are 2½ in. in diameter, and the rivets 1½ in. Messrs. Brampton are prepared to supply motor chains of this or any other pitch. They have a good display of chain wheels of gunmetal and mild steel, and point with pride to many testimonials they have received from well-known motorists.

The Singer Cycle Company, Ltd., Coventry, make an interesting display of their motor-bicycle and tricycles for both ladies' and gentlemen's use. As these were described in our report of the National Show in December last, it need only be mentioned that the engine, carburettor, gearing, magneto-electric ignition device, and in fact everything additional to an ordinary cycle (except one lever and its connections) are contained in the back wheel of the bicycle or the front wheel of the tricycle. All working parts of the engine are of easy access, and there is a marked absence of complications. Small detail improvements since our last description are to be found in the fitting of an adjustable mud deflector to the rear wheel to prevent mud being thrown up on to the engine and its parts, and an oil catcher below the motor. Another little modification is to be found in the provision of a twisting handle on the handle-bar, this handle controlling the motor through connecting rods, a much more convenient device than the plain lever formerly employed. The identical machine which took part in the Easter Volunteer manoeuvres, and which has covered a distance of 200 miles in one day, is on the stand, and attracts much attention. Three machines—two bicycles and a trike—are kept on hand for demonstration purposes in the arena, the performance of the lady rider—Mrs. Narraway—on the two-wheel machine being particularly noticeable.

Messrs. Joseph Lucas, Limited, of Birmingham, have a bewildering display of accessories, lamps, oilers, sparking plugs, terminals, horns in silver, brass, and bronze, calculated to split the ear of the deafest and most hardened disturber of traffic that ever loitered in the King's highway; in short, everything that break down, wear and tear, or police regulation could possibly demand. A "Two-Stage" motor pump (Fig. 34) exhibited claims the advantage of rapid or easy inflation, as may be required. By using the larger cylinder the former is gained. The piston used in this process may be attached to, and become, in fact, part of the cylinder; a smaller piston, till then inside the larger, coming into play produces the less laborious, if slower, inflation. A

FIG. 34.—THE "TWO-STAGE" PUMP.

lifting jack, 8½ in. when closed, and opening to 15 in., might almost be described as a pocket instrument, though capable of lifting 20 cwt. Its larger brother is 11½ in. when closed, and opens out to 21 in. A tire repairing outfit in a neat wooden case, measuring 5½ in. by 2½ in. by 1½ in., contains all that the most troublesome tire could demand.

(To be continued.)

EXHIBITION ECHOES.

THE Duke of Devonshire and Lord Wilton were among the visitors to the show on Tuesday, the latter going for a spin round the arena in one of the Daimler Company's cars.

THE news that Her Majesty the Queen's electrical car was on view seems to have spread like wildfire. It would be difficult for us to say how many times we have had to answer the question—"Where is the Queen's car?"

WE understand that the huge steam caravan of Messrs. Turgan and Foy, which has been the centre of attraction in the Minor Hall, has been sold to a Scotch gentleman, who intends to use it for shooting parties in the Highlands.

It really is astonishing with what rapidity the average man picks up the ins and outs of anything new. We heard one explaining the other day that the radiator of a motor-car existed for the purpose of preventing little boys taking free rides!

THE *Daily News* reporter was very severe on the firms that were late on the opening day—a fact they will probably note on another occasion; for on Saturday we heard of more than a score of purchases, some of them running into four figures.

THE coming tour in Ireland of the Automobile Club seems to have awakened considerable interest in automobiles in the Sister Isle, more than one exhibitor having remarked to us that the number of inquiries for motor-cars on the part of Irish gentlemen is most noticeable.

AS was to be expected, doctors have been well represented among the visitors to the Show. The number, however, has exceeded expectations, one exhibitor telling us that 33 per cent. of the enquiries he has received for cars were from members of the medical profession.

THE people of Islington and the district evidently appreciate the presence of the motor-vehicles in their midst, and although hundreds of cars have journeyed through the main streets to the Agricultural Hall not a single accident has occurred—nor have we heard of the startling of a single quadruped.

A CASUAL visitor going along the Upper Street on Monday would not have imagined a motor-car exhibition was in progress. In front of the main entrance there were two long lines of fashionable carriages, all splendidly horsed. Their owners were in the exhibition examining and, in many cases, purchasing motor-cars.

A *chauffeur* who has been to every Exhibition and automobile event of any importance in both England and France during the past two years, remarked to us that never had he seen such a sight as the yard at the Exhibition has presented any day during the past week. "Motor enthusiasm is great in France," he remarked, "but this beats all!"

MR. W. J. PEALL, the well-known billiard player, who is now one of the most enthusiastic of motorists, kindly played an exhibition game of billiards before members of the Automobile Club in one of the rooms off the Gallery on Wednesday evening. Mr. Peall's handling of the cue was much enjoyed by the thirty or forty members who assembled. We may add that Mr. Peall will give another exhibition game to-day (Saturday), at 5 p.m.

WHILE speaking of Mr. Peall, we may mention that he is about to receive delivery of a 12 h.p. Daimler, which will make his third car. Mr. Peall has been very well pleased with his well-known light green 6 h.p. Daimler, he having driven it over 7,500 miles and only had one stoppage, that of half-an-hour to change a valve.

A LARGE block of rubber in the raw state, resembling an overgrown football, but weighing 6½ cwt., and valued at £140, which is to be seen amongst the exhibits of the North British Rubber Company, suggests an industry to which the Englishman bent on going abroad might turn his attention with advantage. Rubber grows freely almost anywhere in South America; trees are ready for tapping two or three years after planting, and the demand for the raw material is likely to increase. Indeed, it is even now outstripping the supply.

"FAMILIARITY breeds contempt," and the awe, not to say fear, with which the motor-vehicle has hitherto been regarded in this country by a large section of the public shows signs of breaking down. In the Hall the various motor-cars moving to and from the arena excited no consternation amongst the promenading crowd. If anything, the boot was on the other leg—people were not disposed to budge so much as an inch, once having become convinced that the motor-car is really inoffensive and quite tractable. Let us hope that familiarity with its habits will not reduce the motor-car to the deplorable status of the cycle in the seventies of last century.

WELL-CHOSEN was the venue of a pleasant social function which took place on Wednesday evening at the "Welcome" Club, in the Hall, the scene of the Automobile Club's greatest triumph, and to the distant accompaniment of the musical whirl of the motor-cars in the arena, and the murmur of a multitude of enthusiastic spectators who watched their graceful evolutions, members and friends to the number of a hundred dined under the genial chairmanship of Mr. Robert Wallace, K.C. After the health of the King, proposed and drunk in a manner becoming loyal subjects, the Chairman congratulated the Club on its splendid Show, but more particularly on the interest taken in it by the general public, and concluded by toasting all present. Mr. Staplee Firth gave "Our Chairman," responded to with full honours. The Chairman rose once more to announce that speeches were not the order of the hour, though he ventured on a caution, briefly summed up in a few words, "Don't raise the dust." The dust, he remarked, was made by the hammering of horses' hoofs on the hard high-roads, and there it was left. Still it was accounted a crime to motorists who raised it. He thought it would be better if for the present the drivers of broad tired motor-cars would stop at home on dusty days. Referring to the much belaboured question of frightened horses, the Chairman narrated an experience of his own. Stopped on his motor-car one day by a constable regulating traffic, he noticed the restiveness of a horse beside him, which the unsympathetic and somewhat rough efforts of its driver and the constable could not induce to proceed. Requesting both to stay their efforts, he spoke a few soothing words to the animal, which trotted quietly off, quite reassured. The moral of the anecdote is, of course, that tact and good temper on the part of the motorist will do more than anything else to break down the prejudice which still exists against him and his car in some benighted minds. A letter from Sir Francis Jeune, regretting his unavoidable absence from the dinner, was read by Mr. Johnson, and the party broke up.

A PARISIAN cripple, who formerly lived on charity and went from one place to another in a small truck, which he propelled by hand, using two small sticks, has succeeded in buying a specially built motor-car. Now he flies along the streets and is especially engaged by tradesmen as an express messenger. He is said to be proving a serious competitor to the official telegraph, post and parcel service in the district.

MR. D. W. BLAINE, a farm implement dealer of Pratt, Kansas, is now using a motor-car in his daily business. When the vehicle made its first appearance in the district, farmers from far and near drove in their buggies to see it, and were quite delighted when the owner took them for a free drive. Mr. Blaine who is quite enthusiastic over his experiences, says: "I have found that I can get through with three times as much business with the horseless as I could with a horse-drawn buggy."

AT THE EXHIBITION.

BY "WANDERER."

FIVE minutes after I had presented my brick-red ticket at the turnstile through which I was admitted last Saturday to that singularly hideous building, the Agricultural Hall, I was welcomed with a cheery smile by my friend Cordingley, the excellent *impresario* of the Motor-Car Exhibition. There was a "Will you walk into my parlour? said the spider to the fly" look in his eye as he led me into his office. This materialised into, "I wish you'd do me a column or two about the Show. But leave the technical stuff to us." In my charity I agreed to do so, and started round the Hall to pick up "copy." The first thing of interest I came to was a pretty girl selling programmes. She was so pretty that "bang went sixpence"—a bad start, especially as it was full of the "technical stuff" that was taboo for me. The next thing I came to—I cannot explain this—was the same girl selling the *Motor-Car Journal*. I bought two copies, although I had read every word of the paper the day before. Pulling myself together, I went to the telegraph office and wired to several friends, "Splendid show, come up at once." I then thought I would go round and have a look at it.

I SAW much that was of very great interest to me, but that I may not set down here, for it had all to do with carburettors, transmissions, ignitions and other things that I suppose are technical. I explained this trouble to a friend, who said, "The action of C_2H_5OH on CO_2 in suspension in water is very interesting. Let us consider it carefully by experiment. Then you can write about it, as it isn't exactly technical." The experiment was in every way successful, but as I have not the pen of my friend The Pitcher, I cannot make even a paragraph out of it.

I SAW all sorts of distinguished people, whose presence will doubtless be chronicled in some other part of the *M.-C.J.*, as most of them were members of the Club. I had an interesting chat with M. Canello about his eight-cylinder car, which is to win the 10,000 francs, and I listened to him so sympathetically that he took me down to lunch at the Trocadero, where we discussed technicalities to our hearts' content.

I WENT back to the Show in the afternoon and found an enthusiastic *confrère* dragging a charming but very tired wife from car to car. "Doing it thoroughly, old chap," he said. He was. "But I don't expect to get a tenth of it done to-day." This I believed, as after an hour's hard work he had only done a Locomobile and a Mayfair, and was at about the eighth nut of his first Benz. "But we'll come early on Monday and spend the whole day at it." His wife staggered faintly into the sympathetic arms of a *mannequin* in a wonderful fur coat.

I WENT up again to the exhibition on Monday afternoon, and was conveyed round the arena three times. I then went into the small hall, where I met Mr. Panmure Gordon, the great financier. He told me he intended to get the best kind of motor-car. This I believed, as up to now he has had the best kind of everything else there is. Later I ran into the arms of a lesser light in the financial world, Mr. Edgar Pulbrook, who unfolded to me a tale of woe about his De Dion voiturette and Virginia Water, the moral of which was "two special Scotches and a Polly split." And then to bed, as old Pepys would have said.

ON Tuesday morning, being thoroughly tired of motor-cars, I decided not to go out, but to sit in front of my study fire and read a book about horses. I had hardly settled down when my man brought me in a telegram: "Meet me exhibition 12.30. Hales." Now as Hales is that very brilliant Australian journalist who went to South Africa for the *Daily News*, and as he talks well and is a prince of good fellows, I got into my boots and a hansom cab and went up to the Hall via a *Pernod* at the Café Royal. On my way I made up a little plot, in which the chief

players were that programme girl, we two journalists and a sixpence—his sixpence; but I am sorry to say it did not come off. We foregathered between a mauve-coloured Panhard and a Décauville that were panting for the fray in the arena, and I took him round and put a lot of truth into him. He takes a great interest in motor-cars and has his own theories about their possibilities in war, which are very interesting, but which I am not going to write down here—not because they are too technical, but because he is going to write them himself elsewhere. And more power to him.

My friends evidently expect me to live at the Agricultural Hall for I have just—that is, midday Thursday—received another wire from an old friend, "Coming show this afternoon." And it is a horribly damp, yellow day, and my fire is very bright; but after all—he is sure to buy a programme, and I have still a ticket left.

THE Automobile Club of Florence, Italy, is organising an international meeting for June 2nd, 3rd, and 4th next.

THE National Capital Automobile Club has promised to use its influence to induce all owners of automobiles to keep the speed of their vehicles within the legal limits in Washington, U.S.A.

THE Illinois Electric Vehicle Company have decided to go out of business, being unable to operate their carriages at a profit. This is the second of such concerns to take this course, the New England Electric Vehicle Company having closed several weeks ago.

GREAT interest has been aroused in Calcutta by the announcement that Mr. Jamsetjee Tata, the Parsee millionaire, is about to establish a public service of motor-cars between Boona and the hill station of Mahabbishwar, a distance of seventy-five miles.

AT the request of the French Touring Club, M. Pierre Baudin, French Minister of Public Works, has protested against the decision of the railway companies of France, in refusing to accept as ordinary luggage motor-cars weighing more than 150 kilogrammes.

THE Crest Manufacturing Company, Cambridgeport, Mass., is putting on the market a special petrol motor lubricating oil called Crestoline. The oil is claimed to have a high viscosity and a high burning temperature, qualities which are essential in an oil for explosive engine cylinder lubrication.

THE District of Columbia Commissioners recently proposed to frame a regulation compelling each automobile used in Washington to display in a conspicuous manner a number which would enable it to be identified by the police in case of trouble. The Automobile Club has protested vigorously against any rule requiring private vehicles to bear these numbers.

CAPTAIN LATKA, an officer of the Austrian general staff, in a recent lecture before the Military Club of Vienna, stated that an army composed of four corps and two divisions requires for commissariat and transport purposes for a seven-days' march 13,000 wagons, 26,000 horses and 14,000 men, and that the general use of motor-vehicles would enable 6,000 men to do the same work without horses.

MAJOR MAXFIELD, of the Signal Corps of the U.S. Army, has been ordered to Elizabeth, N.J., and Tarrytown for the purpose of determining the possibilities of securing a type of automobile that could be used for a telegraph repair wagon in the field. The use of automobiles in the U.S. Army in various connections is generally looked upon with favour by Lieut.-Gen. Miles, and the entire subject of the utility of the machines will be carefully gone over in the near future.

IN the course of a paper on "Automobiles in New York City," read before the members of the New York Electrical Society recently by Mr. G. H. Condict, consulting engineer of the Electric Vehicle Transportation Company, the author predicted that in a few years notices will be posted to the effect that no horses will be allowed upon the streets of New York, street cars will disappear, and the sidewalks will be elevated so that pedestrians will not be in the way of the electric, petrol, or steam vehicles that will then be in use.

HERE AND THERE.

Le Mois Scientifique et Industriel, a kind of technical monthly review published in Paris, has opened a London office at 30, Durham Road, Finsbury Park, N.

THE motor-car industry is showing signs of progress in India. A company has been recently formed in Bombay under the name of the Indian Motor-Car Company.

THE Bexhill District Council has granted a licence to the Bexhill Motor Car Company which proposes to run four motor-cars as omnibuses within the district.

THE Automobile Club has given a contribution of £25 to the Roads Improvement Association, and one of two guineas towards the Police Orphanage.

ON Monday next Mr. Shrapnell Smith will give a lecture on motor-cars before the members of the Scottish Automobile Club and the Royal Scottish Society of Arts in Edinburgh.

THE photos used in our last issue of the Control Contests at the Crystal Palace were reproduced from negatives kindly lent by Mr. E. M. C. Instone.

MESSRS. MILLS AND FULFORD, Coventry, have introduced a little trailing car for attachment to motor-cars and motor-cycles. The trailer is made in various sizes to suit either juveniles or adults, and is fitted with pneumatic or cushion tires.

IN forwarding us their new alphabetical pocket list of agencies at which their motor spirit may be obtained, the Anglo-American Oil Company call our attention to the large increase. In November last the agencies numbered 512. The April list to hand shows a total of 880.

YET another royal convert. This time it is the King of Italy who has ordered from a well-known French firm two 12 h.p. motor-cars. The elite of Italy will not be slow to follow an example which cannot fail to have beneficial effect on the motor-vehicle industry of the country.

MR. ERNEST HARTLAND, J.P., of Hardwick Court, Chepstow, whilst returning from Raglan in his motor-car with his wife met with an accident at the Star Pitch caused by brake failure. The motor-car ran into a hedge and was disabled, its occupants escaping with a few bruises and scratches.

Two young men, named Spalding and Page, riding in a motor-car along the Thorpe-road at Peterborough, lost control of the vehicle, which dashed into the wall of Thorpe Park, and was wrecked. Both passengers' injuries necessitated their conveyance to the infirmary.

THE horse appears to have accepted his fate and resigned himself to the inevitable. The Right Hon. Sir J. A. Macdonald counted the number passed whilst returning last week from Dashwood, Hill. Of 1,442 horses only three took any notice of his car, and not one of the three shied or showed any signs of alarm, all being quite amenable to their duties.

A LETTER which appeared in our correspondence column last week, in which the writer complained of being unable to obtain petrol at Brighton on Sunday, has drawn a reply from Mr. James Miles of that town, who is as willing to supply petrol on a Sunday as on any other day. He informs us that he holds a large stock at his dépôt, 1, Trafalgar Court. If not found there on a Sunday he is not far off, 22, Argyle Road, the first turning on the right after passing the railway viaduct on entering the town from London being his private address.

WHEN the motor-car made its first appearance in the Philippine Islands, the natives were quite overcome and regarded the end of the world as near at hand. An old native of an ingenious turn of mind, however, solved the great problem that had so upset his brothers and sisters by stating that the car was built on the plan of the modern hand-car used by the President of the Manila and Dagupan Railway, when on his tours of inspection, and that hidden inside were several big, strong Americans, who were working the lever that gave the propelling power. This solution gave the greatest satisfaction to the listeners.

THE Automobile Club of America is organising a run to New Haven, Conn., for May 25, to occupy two days.

IT is announced that a syndicate is being formed to run a line of motor-omnibuses in Sydney, N.S.W.

THE Automobile Club *garage* in Prince's Street, Westminster, adjoining the Royal Aquarium, is to be opened to-day, the 11th inst.

THE fourth run of the season of the Yorkshire Automobile Club will take place on Sunday, the 12th inst., from Bradford to York. The meet takes place at Manningham Park at 9.15 a.m.

AT a meeting of the Penistone Council it was decided to write to the various firms for catalogues and terms for payment in instalments for a steam motor-car.

A COMPANY has been formed in Lerwick for the purpose of purchasing a motor-car, which it is proposed to run between Lerwick and Scalloway.

THE Mikado of Japan has been presented with an electrical motor victoria by Japanese subjects in America. The Mikado is said to be very proud of his new vehicle, and can be often seen in the streets of Tokio.

MR. A. L. DYKE, who was formerly manager of the St. Louis Automobile and Supply Company of St. Louis, U.S.A., has now embarked in business for himself at Linman Building, St. Louis, and will continue to furnish motors, running gears and carburettors, and will also handle all kinds of automobile supplies.

THE *Daily News* considers that "if those who still cling to the superstition of the horse will compare the behaviour of the motor-cars with that of the equine relics on the Epsom road on Derby Day, they will be moved to change their opinion regarding the relative merits and demerits of horse-drawn and self-propelled vehicles."

IN addition to the two electrical vehicles referred to in our last issue, we learn that Mr. Harrison Benn, of Bradford, one of the vice-presidents of the Yorkshire Automobile Club, has ordered a 12 h.p. Serpollet steam car, delivery of which he expects to be made during the present month.

WESTON MOTORS, of 14, Mortimer Street, London, W., have just furnished us with an abridged list of their motors, and an intimation that their complete catalogue is now in the press. The list contains a summary of the many advantages claimed for the Weston. First amongst these is rapidity in starting; the time required for this, it is urged, is less than is required to harness a horse. "Start it with a match" is the motto of the firm.

THE United States Post Office Department has issued an order for the establishment of an automobile mail service between the city post office in Buffalo and the postal station on the grounds of the Pan-American Exposition. Electrical vehicles will be used, and not more than seven and not less than five round trips a day are to be made.

THE Riker Electric Vehicle Company, Elizabethport, N.J., have just finished a new petrol motor. It is a two-cylinder engine having water jackets cast solid with the cylinders. The cylinders are 4 by 4 inches, and the engine, running at 850 revolutions per minute, gives 9 brake horse power. The motors will be made in two sizes, 8 h.p. and 16 h.p. The carriage on which they will be used will have a *tonneau* body, a type which is gaining much favour in America. The motor will be mounted on the front under a suitable bonnet, while there will be a chain drive on each of the rear wheels.

AT the last meeting of the Committee of the Automobile Club, a letter was submitted from the Anglo-American Oil Company as to the difficulties raised by District Councils to the granting of licences to stock motor spirit. The Committee decided that the Anglo-American Oil Company should be asked whether the district authorities refuse to grant licences, provided that the regulations are complied with, and whether they can inform the Club of any specific cases in which licences had been refused although the applicant was prepared to abide by the regulations.

THE FORTHCOMING LIVERPOOL HEAVY VEHICLE MOTOR-CAR TRIALS.

On Monday last, Mr. E. Shrapnell Smith, Hon. Sec. Liverpool Self-Propelled Traffic Association, gave an address on the above subject to the members of the Incorporated Chamber of Commerce of Liverpool, from which the following is an extract :—

The members of this Chamber were addressed on the subject of "Motor-Vehicles for Heavy Traffic" on September 9, 1896, by Mr. Worby Beaumont, when the concluding piece of advice given was—"Stick to your horses for the present." Since then the Liverpool Self-Propelled Traffic Association has been successful in directing public attention to the important future which lies before modern applications of mechanical power to goods haulage on common roads. It is generally well known how the wheels of the vehicles which competed in the 1898 trials proved structurally defective when subjected to the hammering action of granite sets and cobble-stones, whilst other minor troubles, *e.g.*, with the condensers and in respect of adhesion, justified that "sitting on the fence" which was the policy adopted by our Liverpool teamowners and ship-owners, and by Lancashire manufacturers as a whole. The second trials, which took place in 1899, provided satisfactory evidence that the tire and adhesion difficulties had been overcome, for none of the wheels gave the smallest trouble, and five out of the six competing vehicles successfully climbed, both unladen and laden, Everton Brow, Brow Side, and Rupert Lane, where the inclination varies between 1 in 9 and 1 in 13, the heaviest load taken up and brought down again being six and a-half tons. Yet these trials did not satisfy the judges that the time was ripe for any extensive or general adoption of motor wagons. The limit of tare is the great drawback to the undertaking of really heavy work, and here again has this Chamber done good service to the cause of automobilism by moving, and securing the adoption of, a resolution at the recent spring conference of the Associated Chambers. As a result, the memorial of the Automobile Club to the President of the Local Government Board will be supported by a second powerful memorial praying for the same modification of the 1896 Act, *viz.*, the substitution of a maximum weight per inch width of tire per wheel for the rigid and seriously repressive limit of three tons as the total tare weight of any vehicle.

In order to see whether manufacturers could improve their designs so as to produce an efficient vehicle under the three-ton limit of tare, the Association decided to allow an interval of two years between their second and third trials. The result has been that all vehicles have grown heavier, and there is now another strong argument in favour of the desired increase. We have, however, every reason to hope that the Engineer-Inspector who will represent the President of the Local Government Board at the forthcoming trials will be clearly satisfied that the extra weight involves no risk and possesses many advantages. In fact, we sincerely feel that our disabilities should be removed before the end of the present session, and it cannot be gainsaid that an increase is all important for the future development of road haulage. The average daily mileage of a motor wagon, when upon straightforward work, is from thirty-five to forty miles, and, whilst this distance, measured from many of our ports, brings one into sparsely populated districts, such range of action opens up great possibilities for Liverpool and a few other ports in particular.

We ask, not unnaturally, at what cost can this service be performed. The following tables of working costs have been compiled from actual results, and corroborate the judges' estimates of the previous trials and the curves of costs included in Professor Hele-Shaw's paper on "Road Locomotion" before the Institution of Mechanical Engineers twelve months ago.

ESTIMATES FOR LANCASHIRE OF THE AVERAGE ANNUAL WORKING COST OF MOTOR-WAGONS, ACCORDING TO ROADS AND LOADS.

Class of Work.	Weight Capacity.	
Per week { 70 hours under steam. 5½ days. 50 weeks per annum.	Self-contained Motor-wagon 4 Tons.	Motor-wagon and Trailer 7 Tons.
PRIME COST	£600	£675
Interest at 5 per cent. per annum ...	30.0	33.75
Depreciation at 15 per cent. per annum	90.0	101.25
Fuel—Furnace Coke at 15s. per ton ...	63.0	94.5
Wages—Driver at 35s. per week ...	91.0	91.0
Assistant at 17s. 6d. per week ...	—	45.5
Repairs and Adjustments ...	75.0	90.0
Water, lubricants and sundries ...	20.0	25.0

These results are to be obtained from a motor capable of dealing with no larger unit than one of seven tons when fully loaded, i.e., four tons on the motor-wagon and three tons on a trailer, this being the maximum obtainable under the three-ton limit. Shortly, this weight of freight will be increased to not less than ten tons, i.e., six or seven tons on the back of the motor-wagon and three or four tons on the single trailer allowed by law. Increased economy of working will result proportionately, and I might here mention in passing that, although the motor-wagon deals with small units and has high charges per ton for the driver and attendant, it differs in several important respects from the traction engine, which is capable of hauling as much as thirty or forty tons of freight in three trucks. I place the principal features of the two systems of haulage side by side, in order that those who are interested may form their own opinions, but have no intention of abusing the traction engine, which suits many classes of work.

MOTOR-WAGON.

Lorry design.
Smooth tires.
Load, or major portion carried on platform.
Legal speed 5 m. p. hr. throughout.
One man in charge.
No time regulations apply.
Each 4 or 7 tons has its own motive power and driver.
Economy with a load of 4 tons.

TRACTION ENGINE.

Locomotive design.
Ribbed tires.
Load hauled on trailing wagons.
Legal speeds 4 m. p. hr. in the
country, and 2 m. p. hr. in towns.
Three men in charge.
Operations hindered by limits upon
times of working.
Clumsiness of distribution at
termini.
Large trains essential to economy.

Town Haulage.

It is very difficult to give comparative figures for horse-drawn *versus* motor-wagon traffic. For town work a large number of users have found that one motor-wagon will do the work of three two-horse drays. The inclusive cost per annum is that for a service rendered upon average granite sets, and, from the table given earlier in my address, proves to be £381, even if the vehicle travels as much as thirty-five miles per working day. Hence, the cost per horse, inclusive of depreciation, repairs to lorries and gear, wages, fodder, bedding, veterinary attendance, farriery, stabling, and all other charges must not exceed £64 per annum to be as economical.

The Forthcoming Trials in Lancashire.

Passing now to the arrangements for the trials of motor-vehicles for heavy traffic which are to be held from the 3rd to the 7th of June, it is satisfactory to find that there will probably be not less than thirteen vehicles taking part, against six in 1899 and four in 1898. The classification and entries are as follows —

CLASS A.—Load, 1½ tons; maximum tare, 2 tons; minimum level platform area, 45 sq. ft.; minimum width of driving tyres, 3 inches; speed, 8 miles per hour.

Official
No.

A 1.) Geo. F. Milnes and Co., Ltd., (Motor Department), London.

A 2.) CLASS B.—Load, 5 tons; maximum tare, 3 tons; minimum level platform area, 75 sq. ft.; minimum width of driving tires, 5 inches; speed, 5 miles per hour.

Official
No.

B 1.) The Lancashire Steam Motor Company, Leyland.

B 2.) The Mechanical Transport Company, 165, Cromwell-road, S.W.

CLASS C.—Minimum load, 5 tons; no tare limit; minimum level platform area, 95 sq. ft.; minimum width of driving tires, 6 inches; speed, 5 miles per hour.

Official
No.

C 1.) The Thornycroft Steam Wagon Company, Limited, Chiswick.

C 2.) C. and A. Musker, Limited, Liverpool.

C 3.) Simpson and Bibby, Cornbrook, Manchester.

CLASS D.—Minimum load, 4 tons; no tare limit; level platform area not specified; minimum width of driving tires, 4 inches; speed, 5 miles per hour.

Official
No.

D 1.) The Thornycroft Steam Wagon Company, Limited.

D 2.) T. Coulthard and Company, Limited, Preston.

D 3.) Mann's Patent Steam Cart and Wagon Company, Limited, Leeds.

D 4.) Simpson and Bibby.

The trials will be attended by prospective users from all parts of the United Kingdom and abroad. The principal visitors will include representatives of four Government Departments, the High Commissioner for Canada, and five of the Agents-General for the colonies. The Secretary of State for War has appointed the following seven officers:—Col. R. E. Crompton, R.E., Col. C. H. Scott, C.B., R.A., Lt.-Col. F. B. Elmslie, R.A., Lt.-Col. H. C. L. Holden, R.A., F.I.S., Superintendent of the Royal Gun Factory, Capt. E. F. Lindsay Lloyd, R.E., Capt. C. H. H. Nugent, R.E. The Indian Office have appointed Col. Scott, as above, who is Ordnance Consulting Officer for India, and Commander G. T. Wingfield, R.N., Superintendent of the India Store Department. The Postmaster-General has appointed Mr. Francis Salisbury, Postmaster of Liverpool, and the President of the Local Government Board, Mr. G. W. Willcocks, M. Inst. C.E. Lord Strathcona will be represented by the Assistant Canadian Government Agent, Mr. G. H. Mitchell, of Liverpool. The Agents-General who hope to come down are, Lt.-General the Hon. Sir Andrew Clarke, R.E., G.C.M.G., C.B., C.I.E. (Victoria and Tasmania), the Hon. Sir John Alexander Cockburn, M.D., K.C.M.G. (South Australia), the Hon. Sir Edward Horne Wittenoom, K.C.M.G. (Western Australia), and Sir Walter Peace, K.C.M.G. (Natal). A number of municipal corporations have also intimated their intention of sending deputations to watch the competition, whilst the pleasure side of automobilism will be well represented by the leading members of the Automobile Club, who have arranged to tour down to Liverpool direct from the Gordon-Bennett race in France.

Monday, June 3rd, will be devoted to hill-climbing tests at Everton and manoeuvring tests at the docks. The Liverpool depot, where the vehicles will be on exhibition, is the shed and open space at the west side of the George's Dock. The routes and approximate time-tables for the four distance trials will be as under:—

1901.

June 4th. Liverpool (George's Dock) depart 9.15 a.m., Widnes (Town Hall) arrive 11.45 a.m., Warrington (Patten Arms Hotel) arrive 1 p.m. Warrington depart 2 p.m. for Manchester via Hollinfare and Eccles. Manchester (Town Hall) arrive 5.15 p.m., Belle Vue (Longsight entrance), 6 p.m.

June 5th. Albert Square depart 9.15 a.m., Bolton (Town Hall) arrive (Wednesday) 12.15 p.m. Bolton depart 1.30 p.m. for St. Helens via Atherton, Leigh, Pennington, Newton, and Haydock. St. Helens (Town Hall) arrive 4 p.m., Liverpool (George's Dock) arrive 6.15 p.m.

June 6th. Liverpool (George's Dock) depart 9.15 a.m. for Wigan via (Thursday) The Horns, Knowsley, Rainford and Billinge. Wigan (Market Square) arrive 1 p.m. Wigan depart 2 p.m., Chorley (Cattle Market) arrive 3.45 p.m., Blackburn (Artillery Barracks) arrive 6 p.m.

June 7th. Blackburn (Artillery Barracks) depart 9.15 a.m., Preston (Friday) (covered market) arrive 11.30 a.m., Rufford (Hesketh Arms) arrive 1.15 p.m. Rufford depart 2.15 p.m., Ormskirk (Clock Tower) arrive 4 p.m., Liverpool (George's Dock) arrive 6.15 p.m.

Supplies of Pratt's Motor Car Spirit will be provided at the terminal depôts by The Anglo-American Oil Company, Limited.

Influential committees have been formed at the nine important towns embraced by the itineraries. The following gentlemen are acting as local honorary secretaries.

COMMITTEE.

HON. SEC.

Manchester Mr. Alfred J. King, J.P., 20, York Street.
Blackburn Mr. Joseph Watson, Secretary, Chamber of Commerce.
Bolton Mr. Arthur H. Ashworth, Birtenshaw, Bromley Cross.
Chorley Mr. A. Cottam, Assistant Town Clerk.
Preston Mr. W. Lewis Moore, C.A., 32, Ribblesdale Place.
St. Helens Mr. Arthur Robinson, The Brewery.
Warrington Mr. Arthur Bennett, C.A., Market Gate Chambers.
Widnes Mr. Max Muspratt, Gaskell Deacon Works.
Wigan Mr. R. O. Burland, J.P., Poolstock House.

In the "Particulars of Competition" it is stated that, "The Association will arrange with Lancashire manufacturers and Liverpool shipowners for the provision of loads of general merchandise, which will be collected, transported, and delivered free of any charge, as a demonstration that the motor-wagon is a practical and commercial success." The arranging of loads has been the least difficult of the work of organisation, for, contrary to what one might have expected, there appears to be more interest in the matter in East Lancashire even than in Liverpool.

During the discussion which followed the address, Professor Hele-Shaw remarked that the forthcoming trials could not fail to bring out points of the greatest importance to the users of heavy motor-vehicles. These trials did not bring out all the conditions under which motors had to work, for it was not all a question of performing certain tests satisfactorily; there was wear of the machine and other conditions to be taken into consideration. There were not in the whole range of engineering, not even in the case of torpedo boats, cases in which the strain upon the machinery was so great as in motor-vehicles. In these they had to compress into a small space very complicated machinery. It was not intended to hold another series of trials, as it was thought the Association had given the movement a fairly good start, and it now remained for the commercial people to push it on.

The Chairman said he was very glad that Professor Hele-Shaw called attention to the figures given by Mr. Shrapnell Smith. One could easily understand how very economical these motor-wagons would be in bringing coal, say, from the pits of the St. Helens collieries direct to the houses of Liverpool. They had spent a great deal of money in these trials, and this was a movement that Liverpool should be proud of, because this industry was being materially helped on by the aid of the Association.

Mr. A. Holt said that while he would not praise he would not condemn the motor system. He had taken great interest and worked for many years upon the subject of road traction, and they all knew what his ideas were.

Mr. Shrapnell Smith in replying said that with regard to Mr. Alfred Holt's scheme, motor-vehicles could be worked upon a small scale, and their number gradually increased and their scope enlarged if they were found successful.

At the end of the discussion a vote of thanks to Mr. Smith and the Chairman, Mr. Alfred L. Jones, J.P., President of the Liverpool Chamber of Commerce, closed the proceedings.

THE BRITISH MOTOR TRACTION COMPANY (LIMITED) v. SHERRIN.

In the High Court of Justice, Chancery Division, on Wednesday, before Mr. Justice Kekewich, the above action for an injunction to restrain the infringement of certain patents relating to motor-cars was heard. The plaintiffs were the registered legal owners of the following patents:—(a) No. 16,072 of 1893, granted to Wilhelm Maybach for an invention of "improvements in the methods of producing the explosive mixture in hydro-carbon engines"; (b) No. 19,734 of 1895, granted to Count Albert De Dion and Charles Bouton for an invention of "improved means or apparatus for electrically igniting and governing petroleum and other like motors"; and (c) No. 13,671 of 1899, granted to the British Motor Company and Charles Jarrett for an invention of "improvements in or relating to motor-vehicles." The plaintiffs complained that the defendant had imported and sold in this country motor-cars constructed in infringement of the above letters patent. The defendant did not deny the infringement, but disputed the validity of the plaintiffs' patents on all the usual grounds—viz., want of novelty, no good subject-matter, etc. Mr. Justice Kekewich granted an injunction in respect of all three patents, and he also granted a certificate of validity in respect of them.

ACTION BY MOTOR MANUFACTURERS.

In the Chancery Division of the High Court of Justice, last week, the case of De Dion Bouton (British and Colonial Syndicate), Limited, v. C. Manning and Sons, Limited, came before Mr. Justice Cozens Hardy. Mr. A. J. Walter, counsel for plaintiffs, stated the plaintiffs sought an injunction to restrain the defendants from using the trade names of De Dion and Bouton, or either of them, in connection with the sale of motor-vehicles and motors not manufactured by the plaintiffs, and to restrain infringement of copyright, and from issuing circulars similar to or only colourably differing from the circulars of the plaintiffs. Mr. Buckmaster appeared for the defendants, and it was arranged that the first part of the motion should stand over until the trial of the action, and the defendants without prejudice gave a perpetual undertaking not to infringe the plaintiffs' copyright in the circular complained of. Defendants also undertook to keep an account until the trial of all motor vehicles and

motors sold by them under the title De Dion and Bouton, or either of them. Mr. Justice Cozens Hardy assented to the arrangement.

FURIOUS DRIVING CASES.

AT Bedford Borough Petty Sessions Albert Brace was charged with furiously driving a motor-car on April 20th. Defendant pleaded not guilty. P.C. Lutetford stated that about 7.30 p.m. on the date in question he saw the defendant driving a motor-car at a furious rate, and to the danger of the people. The rate was between fifteen and seventeen miles an hour. He called on defendant to stop, but he did not, and on the return journey defendant told witness that he did not see him when he called on him to stop. Alfred Eaton said he was driving a young horse at the time, and the motor-car was travelling sixteen miles an hour. Eliza Wheeler, of Marston, said he was driving a motor-car at a furious pace, but she could not tell how fast it was going. The car passed between her cart and that of Eaton. Defendant stated that it was impossible to travel more than fourteen miles on a level road, with the engine running at full speed, and with an empty car. On this occasion he had eight passengers besides himself. He had thrown off the engine and the car was running with its own weight. Thomas Cource, son of the owner of the car, said he was on it at the time. It was travelling between nine and ten miles an hour. William Cource, owner of the car, said the speed limit was twelve miles an hour, although it was guaranteed by the makers to go fourteen miles. The Bench, after some deliberation in private, decided to convict, and fined defendant 10s. and 19s. 6d. costs. The Mayor said he happened to be an eye-witness of the incident, and he trembled as he saw the car go through the carts.

AT the City of London Court last week Mr. Louis Sinclair, M.P., of Romford, Essex, was summoned for driving a motor-car in the City to the common danger. P.C. Honour stated that Mr. Sinclair drove his motor-vehicle at a very rapid pace at the corner of Cornhill during a press of traffic, and nearly ran a gentleman down. P.C. Gurney said Mr. Sinclair went down Leadenhall Street by St. Mary-axe at a pace of ten to twelve miles per hour on the wrong side of the cab rank, outpacing all the trotting traffic. He put up his hand and called out, "You are on the off-side," but Mr. Sinclair looked straight at him and kept on. He followed, but could not catch him, and witnessed the collision. Mr. Sinclair said that by St. Mary-axe the axle of the motor-vehicle broke, and it was impossible to drive it except by pedalling. It was a quadricycle, and the utmost he could get out of it by pedalling was three to four miles an hour, as the motor was disjointed. An elderly gentleman stepped off a bus backwards, and the motor-car just touched his leg. It was almost stationary, as he had great difficulty in starting it, and the gentleman was uninjured. Master Harry Sinclair gave evidence similar to that of his father, and said he was sitting on the front of the quadricycle with his parrot in a cage. David Smith, engineer, said he sent two men to Cornhill, and they had to push the car, as they could not pedal it. Mr. Holt (for Mr. Sinclair) eulogised the City police and regretted the conflict. He suggested the police had been mistaken. The summons was eventually dismissed.

IN the King's Bench Division, before the Lord Chief Justice and Mr. Justice Lawrence, the appeal of Smith and Boon was heard. In November last appellant was fined £5 for driving a motor-tricycle at an excessive rate through Esher. It was stated that he was driving at the rate of from eighteen to twenty miles an hour. This he denied, and contended that there could be no conviction if no one was interrupted or affected by the speed at which he was riding. On these grounds he asked that the conviction should be quashed. The Lord Chief Justice said in his opinion the magistrates were right in coming to the conclusion that eighteen or twenty miles was not a reasonable speed in High Street, Esher, having regard to the traffic on the highway. Mr. Justice Lawrence concurred, and the appeal was dismissed.

AT the Lincoln City Police Court Frank Jeacock, Gainsborough, cycle agent, was summoned for not keeping his motor-car on the left or near side of Newland on April 25th. Police-constable Cook stated that defendant came down Mint Street driving a motor-car, and he went past the Crown and Anchor public-house on his wrong side. A telegraph message boy had to get off his bicycle, and the defendant ran over it. Defendant admitted that he was on the wrong side, but said the other side of the road was greasy on account of the fair. Defendant was fined 10s., and 5s. costs.

BEFORE the Norman Cross (Peterborough) magistrates Mr. John E. Hutton, of Northallerton, was summoned for driving a light locomotive on the Great North Road at a greater speed than fourteen miles an hour. Defendant did not attend. It was alleged that defendant's car attained a speed of about thirty-five miles an hour. A railway signalman said defendant scattered a wedding party near Wansford Station, and nearly ran over a child. The Bench imposed the maximum fine of £10, with £3 17s. 6d. costs. The chairman remarking that this was one of the worst cases that had been brought before them.

AN OVER-ZEALOUS OFFICER.

As our readers know, Mr. J. Colman, of Woking, has for some time past been carrying His Majesty's mails on a motor-car between Woking Post Office and West End, Chobham. Both car and owner have attracted the attention of the police by committing an imaginary breach of the law.

While the mails were being unloaded at Woking on the first day of the experiment, an officer asked the driver if there was any name on the vehicle, and, on ascertaining that there was none, reported the circumstance. In due course Mr. Colman appeared before the Guildford County Bench "for that he on April 9th, at the parish of Woking, did contravene the regulations of the Local Government Board, made in pursuance of the Light Locomotives Act, 1896, by allowing a locomotive used for the carriage of goods to be used on the highway there without having the name and address of the owner legibly painted thereon."—Defendant pleaded not guilty, on the ground that he was at the time on the King's service—and handed to the Bench a communication from the Solicitor to the G.P.O., stating that it should be pointed out to the Magistrates that the motor-car was not being used for carrying goods, but solely for the conveyance of His Majesty's mails, and was therefore on the same footing as other vehicles similarly employed.—After consultation, the Bench dismissed the case.

WITHOUT A LIGHT.

AT St. Albans City Sessions, Benjamin Swan was summoned for driving a motor-car without a light at St. Albans on April 25th.—Defendant did not appear.—P.C. Cowan said that he was on duty near the Great Northern Inn, London Road, at 10 p.m. on the night in question, when he saw the defendant driving a motor-tricycle without a light. Defendant said he had only come from his shop in the London Road, and he never thought anything about a light.—Fined £1, including costs.

THE EDINBURGH AUTOCAR COMPANY.

AT a general meeting of the shareholders of the Edinburgh Auto-car Company, Mr. John MacDonald (chairman) made a statement, after which a director recommended that they should gradually and carefully wind up the concern, taking time to realise the assets to best advantage, and endeavour to dispose of the business as a going concern, if possible. Other motions to wind up immediately, and to carry on the business, were proposed, but the majority voted in favour of the directors' recommendation, which was adopted.

THE introduction of the motor-car into Klondike is hailed with delight by the inhabitants. Messrs. Clear and Dunham, of Cleveland, Ohio, are the pioneers. The cars, which are built like a three-seated surrey, to accommodate twelve people in all, are propelled by 15 h.p. motors. There is also room on the cars for small packages for the different mining camps on the daily run, and the motor-cars run on the trails and climb the hills without the slightest difficulty.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, MAY 18, 1901.

[No. 115.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MR. C. CORDINGLEY would take this opportunity of returning thanks to the many kind congratulations which he has received from motorists throughout the country on the success of the Automobile Club's Exhibition. These have come from exhibitors and visitors, from members of the Club, and country folk, who rarely come to town, and will be treasured as evidence of the universal

kindly interest felt in an effort to popularise the automobile, and also provide intending adherents of the movement with an opportunity of seeing the latest and the best that money can provide. The organisation of such an Exhibition and obtaining the necessary publicity to ensure good results to exhibitors is no light responsibility. Undertaken with a full knowledge of the valuable help that would be rendered by friends of the *Motor-Car Journal*, the result has justified the effort, and demonstrated that good fellowship can enter into business relations, and that commercial circles are often radiated with perfect harmony and entire friendship.

The Catalogue.

JUDGED by the catalogues sold during the exhibition and the number ordered by readers in the provinces who were unable to come to town, the interest in the automobile has grown quite a hundred-fold during the year. The compilation of such a catalogue necessitates care and caution as well as the prompt co-operation of exhibitors. These three qualities being combined, resulted in a catalogue which will be of permanent interest. In time, the catalogues of these annual displays will constitute a capital record of the progress of the industry, chronicling new firms and indicating the years in which improvements were made in details as well as changes in design. A few copies of the catalogue are left for those anxious to have a set of these annual tributes to the growth of the trade.

To Dust or not to Dust.

OUR subheading is an automobilist's variant of Hamlet's famous soliloquy. The dust nuisance is an irritating, penetrating, unpleasant thing which is associated with all forms of road locomotion. It arises from the state of the roads and not from an inherent evil in vehicles, whether drawn by horses whose hoofs raise dust in clouds, or automobiles, that seem to be regarded in some quarters as the only carriages associated with such an undesirable feature. On a dusty road the most elegant carriage and pair or the most fashionable four-in-hand will secure plenty of inconvenience to the riders, and it is creating a false impression to regard the automobile as distinguished in this respect.

Protection Wanted.

At the same time we recognise the desirability of manufacturers giving full attention to the matter. If they can obviate or lessen the evil, they will provide another feature of popularity for the automobile in securing a vehicle that is not only rapid in its movement, but clean in its disposition.

According to "Teuf-Teuf," in the *Express*, the King recognises this, and is prepared to appreciate the value of any expedient that will enable a ride to be taken without the occupant of the carriage being covered with dust at the end of the journey. In France we have seen an overhanging fabric screen of the same colour as the upholstery of the vehicle used to protect the rear passengers from the dirt of the road. Such a device is not, of course, adaptable to every form of automobile, but it is suggestive in one direction. Now that the touring season is beginning it seems an opportune time to bring the matter forward and whoever successfully encounters the difficulty will reap distinction and probably a royal reward.

The Position of the Patents.

THE result of the action which the British Motor Traction Company, Ltd., brought in the High Court last week with regard to their patents in connection with the Maybach carburettor, the Dion ignition and the De Dion gear has naturally further determined the directors in their policy of prosecuting cases of infringement—a fact which purchasers are not likely to overlook when acquiring automobiles. Mr. Justice Kekewich's decision is certainly likely to play a prominent part in the present position, and the licencees of the company, including the Daimler Company, the Motor Manufacturing Company, the Motor Power Company, Dion Bouton Ltd., Humber and Company, the Ariel Company, etc., will doubtless appreciate the effect that the judgment may have upon the industry. The British Motor Traction Company, Ltd., inform us that they are adding some notable improvements to motor-carriages, and that they regard the latest judicial decision as "the beginning of many great successes." We deal with the action of the trade in reference to Mr. Justice Kekewich's decision in another part of the present issue.

The Tilburstowe Climb to be Repeated.

ON Saturday, 15th June, of glorious memory, the English Motor Club will repeat their hill-climbing competition up Tilburstowe. Events will be arranged for every description of motor vehicles, and in each class there will be a handicap based on the horse-power and passenger-carrying capacity of the vehicles. Several entries have already been received, including some of the cars that will run in the Paris-Bordeaux and Paris-Berlin races. Entries must be posted not later than 8th June. The handicaps will be published in the *Motor-Car Journal* for 15th June.

Medical men and Motor-Cars.

AS further evidence of the growing interest, referred to last week, which the medical profession displays towards the motor-car movement, we call to witness the many pages devoted to the subject in last week's issue of the *British Medical Journal*. The writer, Mr. W. Worby Beaumont, M.I.C.E., urges the importance of a thoroughly reliable motor-car, in preference to some of the cheaper types of vehicles. The medical man, he contends, must save in the long run by substituting steam, petrol, or electricity, for horse-flesh, but let the trade for its own sake see that he has the best motor-vehicle that it can turn out, rather than the cheapest. The question of

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

cost is to the doctor, he continues, precisely that which the manufacturer himself faces when he considers the expediency of throwing out old plant, quite capable of turning out excellent work, but limited in producing power as compared with the new plant, which will cost a great deal and add to his capital outlay. In both cases the outlay means an increased earning capacity. The advantages and disadvantages of the three systems of propulsion in use are dealt with in a manner which cannot fail to prove instructive to all intending purchasers of motor-cars, medical or otherwise.

A Demonstration in Norfolk.

WEST NORFOLK motorists, who have lately suffered somewhat under the law as administered by the various "Benches" of their part, made the hearing of two recent charges of furious driving the occasion of a demonstration. In both cases Mr. Frank Morriss, of King's Lynn, was the individual charged, and as the particular Bench before which he appeared only convicted in one case, dismissing the other, there is reason to believe that the

HOW MR. MORRISS WENT TO PAY THE FINE.

demonstration was not altogether thrown away. The first of our illustrations, Mr. Morriss leaving King's Lynn for Grimston on the day the cases were heard, accompanied by the long-suffering and sympathetic motorists of the district, and the second shows the procession of motor-cars leaving the Court house, the latter being in the background. The particulars of the two cases will be found in another column.

Live Axles.

A NOTICEABLE feature of the Exhibition was the extent to which the live axle is being adopted on light cars. The principal advantage of its use is the facility it offers for an entirely enclosed gearing; and provided that the necessity is realised for a live axle being twice the strength of a fixed one, there are few objections to it. This need is due to the fact that an alternating strain may be taken as twice as destructive in its effect as a continuous one, and the conditions under which the live axle works need a large factor of safety. Another point that has never been alluded to, but is sufficiently obvious, is that the differential gear is exposed to several times the strain that it is under its usual conditions on a countershaft geared up to, perhaps, four or six times the number of revolutions that the road wheels perform, and therefore needs corresponding increase in dimensions. Nothing about a car suggests weakness so much as wheels splayed out under the load they have to carry, which is not an uncommon appearance with light cars, and recalls the Wardour Street dealer's reply to a customer who complained that the chair he had purchased had broken: "Why, someone must have sat in it!"

An Honest Confession.

WE were somewhat surprised when at the Show to hear a strong endorsement of our remarks concerning French and English carriage-work, from the manager of a well-known firm of coach-builders, who further asserted that the same comparison obtained in ordinary carriages, which were better designed and constructed, especially as regarded their ironwork, across the Channel; but to find such facts recognised by those concerned is the best guarantee of improvement. The interests involved, too, may not be merely commercial ones, as was suggested the other day by the sight of a small Locomobile, at the back of which a *tonneau* of large dimensions and solid build had been attached by a local builder. We should have been sorry to occupy it with full load without a preliminary investigation of the factor of safety of the rear axle!

Speed of Motor-Cars.

At a meeting of the County Council's Association, Mr. C. G. Milnes Gaskell (West Riding), on the question of "Roads in Relation to Motor-Cars and Traction Engines," asked whether the present regulations of the Local Government Board were sufficient. At present the cars were required to run at a proper pace not exceeding twelve miles an hour, while a traction engine could not go more than six miles an hour. Should these paces be increased or decreased? Should the drivers be licensed? Should some mark be upon the car? These were the three important questions for decision. Twelve County Councils were in favour of the reduction of the pace of a car from twelve to ten miles, and thirteen were against any reduction. With regard to traction engines, seventeen County Councils were in favour of the reduction of the pace from six to four miles, and four Councils were against any reduction; while seventeen Councils were in favour of the mark being carried, and only one against. No resolution was passed on the subject. In connection with the suggested alteration it is interesting to note the rate of speed permitted in other countries. France enjoys 19 miles in the open country and 12½ miles in towns and villages; Italy 15½ miles in the open and 6½ miles in inhabited districts; and Belgium 19 miles and 6¼ miles respectively.

A Suggested Competition.

DURING the period while the automobilist is debarred from satisfying the elementary sporting instinct of humanity—to get there first—competitions flourish, and nearly every desirable quality in a car—reliability, economy, power—to observe the law, has been the subject of distinct and separate test. But, notwithstanding improvement, now and then—more than now we may hope—a little, just a little, trifling adjustment is necessary. And cars vary exceedingly in the facility with which such adjustments are effected, as was borne in upon us recently when lining up some bearings in two cars. In one, the removal of half-a-dozen bolts was all that was necessary; in the other, twenty-eight bolts had to come out, and involved the search for some box spanners and ratchet brace especially designed for getting at out-of-the-way corners. Of course, the car that wants no adjustment is best, and, fortunately, to judge by the catalogues, there are many of them; but for the others, a repair competition in which the drivers should have to get at, remove, and replace certain specified parts, or rectify some supposed mishap—as, for instance, fired connecting-rod bearing, obstruction in petrol supply, broken valve spring, igniter, slipping clutch, damaged pump, foul valves, etc.—would bring out some important points in design that do not always receive the attention they should. It is noticeable, by the way, that we hear little now of obstructed petrol pipes unless caused by extraneous dirt; it will be remembered that this was not always the case, and probably improvement in the quality of the oil accounts for it; but it is a mistake all the same to have such pipes of too small diameter, or with inaccessible elbows in them. Small matters of this kind add little to the trouble of building a car, and much to the convenience of driving it.

Costs Compared.

M. PAUL MEYAN gives an interesting comparison in *La France Automobile* between the consumption of an 8 h.p. Panhard, on which he made a journey from Paris to Nice and back last year, and a 12 h.p. car of the same make, on which he accomplished the same trip this year. With the 8 h.p. Panhard he states that the cost was just over ten centimes per kilomètre, whilst this year over the same route on his 12 h.p. Panhard the cost was less than ten centimes per kilomètre. The whole distance covered was about 1,992 kilomètres, with a consumption of 364 litres of petrol and ten litres of oil, costing 187f. The journey took about forty-three hours, which worked out at the cost of 4f. per hour, the 8 h.p., however, costing scarcely 3f. In conclusion, M. Meyan states: "If the 12 h.p. Panhard costs more per hour, on the other hand, owing to its great speed, it is cheaper with regard to kilometric outlay. Therefore, the 12 h.p. Panhard is preferable to the 8 h.p. car on the main road."

Spur Gearing.

A DISCUSSION at the Philadelphia Engineers' Club on a subject of interest in automobile design namely, high-speed gearing, is reported in several of the technical papers. It is true that spur gearing as usually employed in motor-vehicles can hardly be qualified with this adjective, the peripheral velocity of a Daimler fourth-speed wheel being only about 1,000ft. to 1,300ft. per minute, in the case of a 6 h.p. car, while heavy gears in rolling mills and the like may have speeds of 2,000ft. to 4,000ft. Several of the points brought out, however, may be profitably considered by motor builders; among these are the importance (sufficiently obvious) of accurately cut teeth, and the fact that these should have no clearance, a state of things that it is to be feared cannot exist long under road conditions. It is also remarked that in heavy machinery it is inadvisable to have a gear-wheel too near to a fly-wheel, any change in the velocity of the latter causing injurious jar to the teeth unless the elasticity of a certain length of shaft is interposed. It would seem worth consideration whether some form of elastic drive, after the manner of the spring-driven sprocket-wheel tried some years back on cycles, might not be advantageously introduced into the gear-box of a car, to diminish the injurious effect of irregular propulsion or retardation. The quality of steel suitable for gear wheels occupied considerable attention, preference being expressed for the harder steels with from .05 to .08 per cent. of carbon. Here little parallel can be drawn with motor-car work, where a mild steel hardened is preferable; but there is too much tendency in this country to trust to rule-of-thumb workshop practice instead of scientific examination in the choice of materials. Some comments on the undesirability of bevel gears, where avoidable, on account of their sensitiveness to errors in alignment, are eminently suggestive in connection with the present tendency to make use of them in car design.

American Roads.

At the second annual dinner of the Automobile Club of America, Lieutenant General Miles congratulated the members on their efforts to improve the roads of their country. Good roads, he declared, were a sign of high civilization and an enormous economy to the country that possessed them, saving something like two-thirds of the cost of transit. The "mud-fiend" was referred to by the gallant General as swallowing up over £100,000,000. It seems an incredible amount, but America is a big place, and we know they do things in a big way over there. Mr. E. A. Bond, State Engineer, predicted the happy time, not so far distant either, when a great and well-kept highway would stretch from Maine to California. Roads, or the want of them, seem to be the question of the day amongst trans-Atlantic motorists. As General Miles remarked, the Romans made good roads, and commerce followed, but, unfortunately for America, the Romans never went there.

Road Racing in France.

IN his concluding letter to the *New York Herald*, on automobile racing in France, M. Leon Auscher sounds a note of warning to competitors and organisers alike. To use his own words, "I have noticed, not once, but over and over again, that, despite all previous warnings, racers rush through villages and townships, where no controlling offices are established, at lightning speed. There have, as yet—the inhabitants having been forewarned—been no victims of this imprudence, but any day an accident may occur, and then, good-bye to racing, if not throughout the whole of France, certainly in the region in which the accident has taken place." To obviate the risk of such a calamity, M. Auscher makes some practical suggestions, which the French Automobile Club would do well to consider. A more careful selection of routes, eliminating as far as possible crowded districts, is advised, as also is a compulsory speed limit whilst passing through villages.

The Queen's Electric Car.

IF anything were wanting to invest the pastime of motoring with greater popularity in ladies' eyes, it is surely supplied by the fact that Queen Alexandra has not only purchased for herself a "victoriette," but has learnt to drive it herself. Electricity is the motive force of the extremely smart little vehicle, with seats for two, that her Majesty has selected. The wheels are of the cycle type, with 3-in. pneumatic tires,

HER MAJESTY THE QUEEN'S ELECTRIC CAR.

rendering the car free from vibration or noise. Naturally, it has every accessory for comfort; the seats and back are upholstered in dark morocco leather, the floor is covered with rich carpet, and all the fittings and lamps are silver-plated. The vehicle, of which we give an illustration, was supplied by the City and Suburban Electric Carriage Company, Ltd.; it formed one of the attractions at the Show last week, having been sent up specially from Sandringham, whither it was returned on Saturday.

"Madame" on Motor-Cars.

OUR contemporary, *Madame*, takes a just and practical view of the difficulty which exists between motor-car drivers and County Councils on the speed question. The driver of any other vehicle, urges our contemporary, is as liable to shirk the responsibility of an accident as the motorist, if inhumane; yet no one has ever suggested numbering private horse-drawn carriages as a means of identification under such circumstances. The friction between legislative bodies and the promoters of a new industry is deplored as one of the reasons which keeps us so far behind other nations where enterprise is concerned.

Madame's concluding sentence is essentially womanly. "One thing everyone who lays any claim to humanity will be thankful for when motor-cars become general, and that is that heavy vans and carts will no longer be drawn by horses, and the sufferings we see every day in our streets endured by those over-driven, under-fed animals will be at an end for all time."

The War Office and Motor-Cars.

THAT the motor-car must supersede the horse-drawn vehicle has even become apparent to that most conservative of all offices, the War Office, to wit. The Secretary of State for War has offered three prizes, £500, £250, and £100 each, for the three best self-propelled lorries for use in military operations. Intending competitors must send in their names to the Secretary of the Mechanical Transport Committee, at the War Office, on or before September 1st, and trials will commence on December 4th. Full particulars will be found in another column.

Motor-Cars in the Manœuvres.

As a result of the recent correspondence between the Automobile Club and the military authorities, twenty-two motor-cars and cycles have been entered for service during the forthcoming autumn manœuvres at Salisbury Plain, for carrying staff officers and despatches, and keeping up the lines of communication. Two military members of the Club, Lieut.-Colonel Holden and Colonel Crompton, have drafted a scheme for consideration by the War Office. They suggest that the owners should be allowed the cost of fuel and repairs, with 10s. a day as personal expenses and 5s. a day for the mechanic. The military authorities, it is thought, should provide for the safe custody of the cars, and should find tent or other accommodation for the automobilist and his servant. Both the authors of this scheme are experienced soldiers and automobilists. Lieut.-Colonel Holden, R.A., is superintendent of the Gun Factory, Woolwich, and Fellow of the Royal Society. Colonel Crompton, R.E., has recently returned from South Africa, where he commanded the Electrical Volunteers.

The Liverpool Heavy Vehicle Trials.

REFERRING to the forthcoming trials of motor-vehicles for heavy traffic to be held next month by the Liverpool Self-Propelled Traffic Association, full particulars of which we gave last week, we understand that the Association is open to hire light motor-cars for the transport of visitors during the trials, June 4th to 7th. The Association will provide storage accommodation and petrol at Liverpool, Manchester, and Blackburn, and will also undertake the cleaning of carriage-work and wheels. Owners desirous of hiring their vehicles should communicate with Mr. Shrapnell Smith, Hon. Sec. Liverpool Self-Propelled Traffic Association, Royal Institution, Liverpool.

Vanish Suburbia!

"SUBURBAN" will cease to exist as a term of reproach. A well-known Society lady, who has a box at the Opera, travels to and from it in a motor-brougham, a feat far beyond the endurance of a horse, for her house is far beyond the four-mile radius. Suburban residences will become the rage with the spread of motoring, the *Onlooker* predicts. No one will continue to live in stuffy London when pure air and a charming garden, with other country pleasures, may be enjoyed within some half-hour's run of London.

Result of a Ride Round London.

WHEN the members of the West Riding County Council met to discuss a Memorial from a number of manufacturers and others interested in motor-cars, with respect to the proposed limitation of speed on highways, a certain wise Councillor, who had made a trip round London with

the Automobile Club, boldly took up the cudgel on behalf of motorists. So effectually did the proselyte wield the cudgel of reason that the proposed speed limit of ten miles an hour was not accepted by his brother Councillors. The Automobile Club is to be congratulated. With continued efforts there is little doubt that in time the mass will be leavened.

BRADFORD TO LONDON BY MOTOR-CAR.

PERHAPS the following account of a run I made on Saturday the 4th inst., from Bradford to London on my Jackson doctor's car, made by the Yorkshire Motor-Car Manufacturing Company, Ltd., may be of interest. The car was a 5 h.p. double-cylinder, water-cooled one, to carry three persons, and we were laden with two passengers and about twelve stone of luggage. We left Bradford on Saturday at 1.30 p.m., intending to reach London at 1.30 p.m. on Sunday, taking things easily by the way and not grudging ourselves time for meals, etc. We arrived at Doncaster, thirty-six miles, at 5.15, the only stoppage having been one of twenty minutes to fit a fresh ignition tube, in place of the old one, which cracked. At Doncaster we stayed two hours for tea, saw several cars about the town, and got a supply of lubricating oil. 7.15 saw us again under weigh, with Newark, thirty-nine miles, as our destination for supper, which we reached without any incident at 10.15, except a long wait at a level crossing where shunting operations were in progress, so that this was a stretch of fine travelling—thirty-nine miles in just over two and three-quarter hours. At 11.45 we left the courtyard of a most hospitable and comfortable hotel with a supply of sandwiches, and well wrapped up for the next run of eighty-three miles to Biggleswade, where we expected to breakfast. The full moon was now up and the nightingales singing in the woods as we sped along, and mile after mile was rapidly covered until, about one o'clock, we ran into thick, cold, white mist. The moon was obscured by cloud, and we had then a very cold run till Stamford was reached at 3.0 a.m.; thirty-eight miles in 3½ hours. Here we hunted for a policeman to direct us to the London road, but found none, and unfortunately took the wrong road, and went some five miles in the wrong direction, so that with the time taken in finding water and filling up petrol tanks it was four o'clock before we finally left Stamford behind.

The early morning run of forty-five miles from there to Biggleswade occupied 4½ hours, and the quantities of game we scattered to right and left on the road—pheasants, partridges, hares, and rabbits—showed the district was a happy hunting ground for sportsmen. The Ivel Hotel at Biggleswade and its host, Dan Albone, well-known to long-distance cyclists, made us welcome to breakfast, and we stayed there 1½ hour, till 9.30, leaving 3½ hours to complete the remaining forty-five miles to town before our appointed time, 1.0 p.m. Hitchin, Welwyn, and Hatfield were rapidly overtaken and left behind, and the thousands of cyclists we met told us of the near proximity of a great city. Barnet was passed and Highgate Archway soon appeared, and at 1.10 p.m. we ran up to the Agricultural Hall at Islington, or twenty minutes within the twenty-four hours gross time for the distance of 203 miles. Deducting the stoppages for meals, the running time was eighteen hours, and again deducting minor stoppages for level crossings and lubricating purposes the actual running time was brought to seventeen hours net, or the regulation legal maximum speed throughout. The consumption of petrol was very low, being under seven gallons, or equal to about 8s., or 1½d. for passenger per mile. JAMES EDW. TUCKE.

THE quiet little Norfolk village of Hunstanton was last week convulsed with excitement, caused by the unexpected arrival of Her Majesty Queen Alexandra on a motor-car. Her Majesty had ridden from Sandringham to pay a surprise visit to the Hunstanton Convalescent Home, in which she is kindly interested.

CORRESPONDENCE.

AN OBSTINATE VOITURETTE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a voiturette (De Dion Cudell) which I cannot get to work properly. It will start easily with a full carburettor, and will run up a slight hill on the slow gear; but, if the hill is at all steep, it slows down, the explosions fail, and it soon stops. With a good start down hill the fast gear can be put on, and the car will run well for miles at high speed; but woe to me if I have to slow down or stop. The carburettor must be refilled, and I must push vigorously to get a fresh start on the slow gear. The engine runs very freely, and so does the car. The gear is in good order, and the sparking seems all right, but explosions fail with slow running. I have put in new batteries and accumulators, have taken off the fibre sparking-plate and cleaned it, have changed the sparking-blade, and have even gone to the expense of a new coil, but all to no purpose. Compression is good, and the fault is in some way in the explosion.

An experienced motor-engineer has spent much time in endeavouring to find out what is wrong, but in vain. If any of your readers can help me I shall be thankful. The car has only been in use for three months and is quite useless. It used to run well enough.

By the way, I have a complete electric lighting plant and ample water-power, and can charge accumulators for any brother-motorist who may be in difficulties.—Yours faithfully,
G. W. GRABHAM, M.D. (Lond.)

A PROPOSED MOTOR RACING TRACK.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the proposed racecourse for automobiles round Wembley Park, I should have thought it would not have been at all difficult to get twenty automobilists to pay £25 a year to insure interest on the amount required. I would be myself quite prepared to guarantee £50 or £100 for this purpose. I think if the idea could be pushed along it would do an enormous amount of good for automobilism in this country.—Yours truly,
S. F. EDGE.

THE BUCHET WATER-COOLED MOTOR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be much obliged if some of your readers can give me information of their experience with the above-mentioned engine. It would appear that it has done good service upon French roads, but it seems, notwithstanding, to be little known or used over here.—Yours faithfully,
ENQUIRER.

LUBRICATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the number of oils for cylinder lubrication on the market there is much confusion in one's mind as to which is the best to use. For some time past I have given the matter special study, and with surprising results. Perhaps, if interesting to your readers, you will allow me to give a few details of my experiences. In the first place, I have come to the conclusion that most oils on the market for the purpose of cylinder lubrication at high temperatures are totally unsuitable for such work. Nearly all mineral cylinder oils on the market are purified by the use of sulphuric acid, and are also mixed with animal and vegetable fat to suit the individual mixer's fancy. The high temperatures of explosion engines quickly release the sulphur compounds and acids by bursting the globules of oil, each of which contains its percentage of acid, and which acts with deadly effect on cylinder walls and piston rings. In addition, most of these oils carbonise at comparatively low temperatures and deposit the carbon in the pores of the metal; thus, instead of having clean metallic surfaces coated with an efficient lubricant, we have what one may call a composite surface formed of the

carbon deposited in the pores of the metal, which must absorb more horse power than clean metal surfaces kept in good order by an efficient non-depositing, pure lubricant. This latter is a condition absolutely essential for explosion engines, if the highest horse power and economy are to be obtained. I have tested a number of the leading oils on the market and unhesitatingly plump for "Wilburine," an improved Valvoline oil, which has been introduced by Messrs. Boulton Bros. and Co., of Liverpool. It is absolutely the purest oil I have met with. It keeps the cylinder perfectly clean, thoroughly lubricates, and leaves no deposit. In my tests, which were carried out on Benz and De Dion air-cooled as well as water-jacketed engines (to give me the two extremes), in comparison with other oils, "Wilburine," when only using one-third the quantity, actually gave better engine efficiency, a point which was emphasised in every test, showing increased horsepower, as evidenced by the speed hills were climbed. The improved engine compression was also most marked.

On a run of 110 miles on a Benz 3 h.p. car, the consumption was one-third of a pint for cylinder lubrication. On the same trial I made an experiment with Valvoline engine oil on crank pin and loose pulley with a special cup which feeds oil to these parts only when car is in motion. The consumption for crank pin was 1½ oz., while that for loose pulley was ⅔ths of an ounce, no grease being used and no trouble from greasy belts.

In conclusion, I may say I have no interest in any way in writing this further than to let fellow motorists know of a good thing when I find it.—Yours truly,
GEO. GIBSON.

VOITURETTES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The makers of voiturettes seem to have overlooked the fact that their vehicles will some time or other require repairs on the road, and with some of these it is easy to see that a breakdown means the abandonment of a journey, at least, till the spare parts can be obtained from London, Coventry, or Paris. And, in my humble opinion, a car that can be patched up on the road at the nearest country smithy, and is able to complete its journey or to get home without help, is a better car, in the long run, than another which may be five or six miles an hour faster.

I should like to know how many car owners have considered beforehand what to do in case of certain breakdowns? How many carry clips to fix a broken spring or spare gear wheels to replace any that may strip their teeth?

Living, as I do, on a main road, where sometimes five or six cars pass daily, I have noticed during the last year a good many of the voiturettes *en panne*; one by a well-known French maker was in my yard last autumn for some hours, while the owner and his man tried to patch it up, but with indifferent success. Another, also a French car, was laid up in a neighbouring ironmonger's yard for about a fortnight at Christmas till the necessary gear wheels were obtained from Paris. Another French car was laid up this spring for ten days through some undiscovered defect. A few days ago a man brought a voiturette, also French, for me to see, and offered to take me for a run; we were half an hour going a mile and a half—something was wrong with the ignition, he said. Had I been a prospective customer I should have declined to purchase at any price.

I have driven a Benz nearly three years and have only been *en panne* twice from a breakdown—once from one of the original tires coming off, and the second time from the breaking of two teeth in the fibre wheel which operates the exhaust; in this case a local smith inserted two iron pegs in the wheel. In neither case did the stoppage exceed 1½ hours. Sometimes we are told the Benz is out of date, but it seems to me that the facilities for repair counterbalance the advantages of the few more miles per hour that the voiturette can do.—Yours truly,

JOHN HENRY KNIGHT.

EXHIBITION IMPRESSIONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been most interested in the show at the Agricultural Hall, and I notice that it appears to be made clear to me

and other buyers that *speed* in the automobiles is the main matter to which the increase of power is devoted. May I be permitted to place on record that I believe many buyers would much prefer—and I certainly speak for myself—a more reliable positively certain acting engine, and I should be quite content with a maximum speed of twelve to fifteen miles per hour.

I would say that if a motor-car could be provided to run with absolute certainty ten or twelve miles per hour, day in, day out, for six or eight months on end, with but the ordinary care a mechanic ordinarily accustomed to steam or gas engines can be expected to give, and propel a vehicle such as a landau, to carry four persons with a reasonable amount of personal luggage, the sale for such a carriage would be enormous; but so long as, say, £250 to £750 is charged, the problem of automobilism must remain the fad of the wealthy and leisured class, and the relief of our crowded streets remain a question of the distant future.

I recognise the enormous strides made during the last four years, yet I regret the advancement is made in the direction of the fashion for speed, in place of the direction of the more sober and practical daily use.—Yours truly,

PITHOLONYRRH.

THE BRULÉ MOTOR-OMNIBUS.

THE accompanying illustration depicts a 20 h.p. omnibus capable of accommodating ten persons lately introduced by Messrs. Brulé and Co., of Rue Boimod, Paris. Any type of carriage body can, however, be fitted, as the motor and transmission gear are mounted on an independent frame of channel steel, suspended by springs both at the front and rear, on the axles. To deal first with the engine, which is stated to develop 20 h.p., this is located at the rear end of the frame; it comprises three cylinders; in the two outer ones actual explosions take place alternately, the products of combustion passing to the central cylinder, which is actuated by the expansion of the burnt

THE BRULÉ MOTOR-OMNIBUS.

gases. The engine is claimed to be very economical in its working. The cylinders are water-jacketed and the ignition is electrical, the sparking plugs being fitted in such a way that they can be readily removed. The carburettor is of the constant-level type and is so arranged that the driver can see at a glance how much petrol it contains. Suitable handles are fitted within convenient reach of the driver, by means of which the quantity of both air and spirit allowed to pass into the carburettor can be regulated. Like all modern motors, the Brulé engine is also fitted with an automatic governor, which, when the speed of the engine becomes too great, so acts on the admission valve as to diminish or cut off the supply of carburetted

air to the explosion chamber. Coming now to the transmission mechanism, the change-speed gear, which consists of a train of spur wheels, is adapted to give four forward speeds and a reverse motion. The motor drives, through a progressive friction clutch, a short shaft fitted with the variable-speed gear above referred to. Any one of the spur wheels of this gear can be made to mesh with corresponding pinions on the differential shaft. Steering is controlled by a vertical hand-wheel, the front wheels being mounted on the customary short vertical pivots. Ample brake power is provided, there being a band brake on the differential and also cord brakes acting on drums attached to the hubs of each of the rear wheels and operated conjointly with the friction clutch, by means of which the engine can be thrown out instantly from the transmission gear.

JOTTINGS BY A WORLDLING.

THE commercial success of the Exhibition could not be better illustrated than by the fact that I know fourteen men among my friends who bought cars at Islington.

I SEE they have had an exhibition and *corso fleuri* at Strassburg. It is some years since I have been in Gutenberg's city, but the last time I was there I was on a motor-car tour. I remember being very much impressed by the contrast between the horrible newness of my automobile and the splendid age of the mediæval streets. At the old Rebstock Inn at which I put up, they told me mine was the first car that had been in the street.

A GENTLEMAN with a most imposing name who has devoted his life to the manufacture of rickshaws at Tokio, has suddenly condemned that charming vehicle to the limbo of the past and taken to making motor-cars. He offered the first one completed to the Mikado; it was a steamer with a bamboo frame.

THE other day, at the Savage Club, where I had lunched with a friend, we were talking about motor-cars and the necessity of "putting" the movement in every way possible. Many suggestions were made, the best of which came from a man who writes operas and things. "Why don't you get Tamagno," he said, "to sing '*La donna è Automobile*'?"

It is really astonishing that so few shops have adopted motor-cars for delivery purposes. It seems to me that at the present moment it is almost worth a firm's while to run cars about London for advertisement alone, but the time will come when they will be so common in the streets that no one will look at them. That is, to-day they have dual advantages, whereas to-morrow they will have only one, that of economy.

I understand that some surprise has been expressed about my statement that the Motor Manufacturing Company's Gordon-Bennett Cup car will have five De Dion motors coupled. I think, however, that my information was correct, especially as it has since been corroborated by what one or two people who are supposed to be in the "know" have told me.

A CERTIFICAT DE CAPACITE to drive motor-cars has been issued to Madame Serpollet.

MR. REGINALD STANLEY, J.P., of Nuneaton, has just purchased a Locomobile steam car.

TO-DAY (Saturday) the members of the Automobile Club will have a run to Guildford, starting at 2.30 p.m.

MR. HANKIN, of the Swan Hotel, Alresford, concerning whose charges for stabling a motor-car there has been some recent correspondence writes us that he will in future adopt the scale of charges we suggested in our issue of the 27th ult.

TO-DAY (Saturday) the Automobile Club of Ireland meets at Shelbourne Hotel, Dublin, at 2 p.m., for a forty-three mile run, Rathcoole, Bishopscourt, Sallins, Naas, Rathcoole, and Dublin being the route. May 25th to 28th is the date fixed for the run to Enniskillen and back.

FLOTSAM AND JETSAM.

BY "FLANEUR."

Place aux Dames will soon be the cry, at the rate we are progressing. It was pleasing to the eye to watch the graceful evolutions of the lady on the Singer motor-bicycle during "Show week," and more than one car made the circuit of the ring under feminine control. But on Saturday I noticed, in the yard of the Agricultural Hall, a little car that is assuredly entitled to the premier position in our regard where ladies are concerned, for its owner had accomplished more on this vehicle than is known to have been achieved by any other *chauffeur*.

It was the little 5 h.p. Renault belonging to Miss Vera Butler to which I refer, and I happened to meet its owner and her father, Mr. Frank H. Butler, the genial ex-treasurer of the Automobile Club, at the Show on Saturday afternoon, whither they had driven as soon as possible after their arrival from Paris. Miss Butler has not only piloted this car from Paris to the South of France, and back again to England, but has also driven to the Grande Chartreuse, involving an ascent and descent of over 4,000ft., with occasional interludes in the shape of unwitting incursions into snow-drifts, for in April, of course, the snow had not yet melted. In five days the car covered no less than 967 kilometres, a matter of 601 miles. Think of this, oh ye sceptics of the great British public, who find it so hard to credit any virtues to the new means of locomotion!

DURING all this time the car did not give the slightest trouble, either in respect of the motor or the tires, save for two punctures, each caused by a nail. The little Renault is of the ordinary pattern, with spider seat behind, and seemed last Saturday to bear no marks of its long travelling, the only indication of its having been on tour being the canvas hood with which it was equipped. I may add, by the way, that Miss Butler's future aspirations lie in the direction of a light steam-car—for purely town work, of course.

ANOTHER enthusiast who must be mentioned in this connection is Miss Balfour, who visited the Show on the penultimate day in company with the First Lord of the Treasury and the President of the Board of Trade. It was known some time ago that Mr. Arthur Balfour had ordered a De Dion voiturette for "Miss Balfour," but it was less widely known that he stood in an avuncular, not fraternal relationship to the lady in question. As to whether Miss Balfour herself drove the car or was driven was also a matter of conjecture only, but I now learn that not only does she manage the voiturette herself, but is in every way an ardent and accomplished automobilist, prepared to discuss carburettors and transmission gears with the best. Miss Balfour has expressed a keen interest in the forthcoming international race for the Gordon-Bennett Cup, and made close enquiries as to the progress of the 50 h.p. Napiers.

INASMUCH as motor-cars are more or less expensive articles, it was encouraging to the trade to note the presence, on every one of the days during which the Show was open, of visitors who were obviously well-to-do, and whose carriages were thickly congregated in the road outside. Automobile purchasers have largely been recruited up to now from the ranks of professional men, either doctors in need of something more efficient than the horse for their daily rounds, or engineers whose mechanical knowledge enabled them to recognise the value of the four-cycle-motor as applied to road locomotion. Of those who have acquired cars for pleasure, pure and simple, the number has been relatively small, but signs are not wanting that henceforth this class of purchaser will be enormously increased, to the manifest advantage of all concerned. With orders coming in from persons of ample means the manufacturers will be under no necessity to sacrifice the attainment of the highest efficiency on the altar of expense, and improvements in the cars themselves are certain to follow accordingly.

BUT, useful as the influx of "carriage folk" will undoubtedly be, there is a point to which I venture to draw attention, because it will affect the future of the automobile movement, to my thinking, more vitally than anything that has yet been mentioned. It is too commonly assumed that the whole aim of automobile manufacturers is to convert every user of a horse into the user of a self-propelled vehicle instead, and that it is among the carriage-users only that efforts to proselytise must continue to be made. This notion requires to be combatted all along the line. Automobilmism provides not a mere alternative to the use of carriages, but a totally new form of sport and pleasure, a form which will appeal—and this is the point—to thousands and tens of thousands who have never had the most infinitesimal desire to possess a horse and carriage. There are plenty of people who could afford the acquisition and the up-keep alike of a dog-cart or a brougham, but who prefer to take their pleasures in other ways. Let them but be imbued with an appreciation of the efficiency of the motor-car, and the pleasure to be derived from its use, and they will not rest content until they have obtained one, even though the initial cost be far greater than the horse and carriage to which they have never aspired.

Now there is abundant evidence already that the joys of automobilism have become objectively known to many of this class, either through reading about the subject or from opportunities of observing the actual capacities of motor-cars of all types. It is equally certain that they will make every effort to acquire a car, as a source of pleasurable recreation, precisely in the way that scores of thousands of poor clerks and others have spent their ten or fifteen pounds upon a bicycle, although they never put so much money down for any single article before. Of course the number of persons who can afford a car at all will be limited within certain bounds, but that these bounds are much wider than is often supposed I, for one, am definitely convinced. And though, like anyone who knows the present-day cost of producing a good car, particularly while types are going through experimental stages, I do not join in a cry for greater cheapness, or for that £100 car which is to do everything that even a £500 car will not do, I nevertheless indulge the hope that, with a largely augmented demand, and the standardisation of parts, it will ultimately be possible to supply a low-priced but efficient car for the moderately well-to-do, and so bring in an army of new recruits.

AN ingenious device may be observed on the 12 h.p. Daimler of Mr. Oliver Stanton—or perhaps I ought to say, in view of Mr. Justice Buckley's decision last Monday, the 12 h.p. car made on the Daimler principle by the Daimler Motor Company, of Coventry: one will have to be punctilious in these matters for the future. Inside the dashboard is fitted a small tap, connected with the water-tank, and by this means it is possible to ascertain at any time whether the pump is acting properly. If the tap be turned in daylight the spurt of water will tell its own tale at once, while even in the dark the amount of pressure can be determined by the finger. But the utility of the device does not end here. Beneath the tap is placed a small funnel, connected with a pipe which leads to the inner surface of the countershaft brake. On a very steep descent the tap can be turned on, and a stream of water directed to the brake, which is thus kept cool under friction, and firing is prevented. Mr. Stanton tells me that he was afforded this tip by Count Zborowsky, who uses it on his 24 h.p. Cannstatt Daimler, but whether it is a feature of all the Cannstatt cars I am unable to say.

A FINE display of official ignorance on the subject of petrol has been described to me by a friend who has recently received delivery of a new car, and hired a stable in the West End to keep it in, as his own premises did not afford the requisite accommodation. Not desiring to come into conflict with the authorities on the subject of petrol storage he caused to be erected, at his own expense, an arrangement of corrugated iron, in which to keep his petrol in the

open yard, well away from the stable in which the car was housed. When all was ready he duly wrote to the local authorities, and asked them to send down an inspector to take note that all was in order. When that functionary eventually arrived he looked at the special erection of iron and then informed the astonished *chauffeur* that he must keep the petrol in the stable! "Better to have it where the car is, you know," said the sapient inspector. But my friend does not know. He is just as anxious to avoid a fire as any public body, for the sake of his car as well as the adjoining property, and why he should place either at the mercy of a careless stableman is more than he can fathom. Consequently the chances of that fatuous inspector's ridiculous injunction being obeyed are something below zero.

THE COHENDET PETROLEUM-SPIRIT MOTOR.

WE are herewith able to illustrate a new single-cylinder vertical petroleum-spirit motor which has lately been put on the market by Messrs. A. Cohendet and Company, of Quai Jemmapes, Paris. The engine is very compact, as will be seen. The water jacket extends around the head and valve chambers, as well as the cylinder. The valves are located

at the side, one above the other, the sparking plug being arranged between them. The cylinder has a diameter of 90 mm. by 100 mm. stroke, the engine developing about 3 h.p.

In connection with their fifteenth annual hill climb at Westerham Hill, the Catford Cycling Club have arranged to hold a competition for motor-bicycles, tricycles, and quads. The competition will be under N.C.U. rules, which permit pedalling. The course is marked out exactly to one mile, and the rise is about 400ft. in the distance, varying from 1 in 6 to about 1 in 25. The contest is on the same hill as last year, but is now confined to motor-cycles.

At a meeting of the Society of Arts, on Wednesday evening, Mr. Marconi explained his latest improvements in electric communication without wires. He has been able to attune his receiving and sending instruments in such a manner that a message can be transmitted from one station to another "without danger of the message being picked up by other stations for which it was not intended." This new advance has led to the construction of portable apparatus for Army purposes, and with this view a complete installation has been attached to a steam motor-car, from which messages have been sent over a distance of thirty miles.

AN IMPORTANT AUTOMOBILE TRADE MEETING

A RECENT decision in the High Court of Justice in the matter of the British Motor Traction Company v. Sherrin, already reported in these columns, was the principal subject of discussion at a hastily-summoned meeting of the members of the Automobile Mutual Protection Association held at the Agricultural Hall on Friday, the 10th inst., during the Motor-Car Exhibition. So keen is the interest felt in the matter that, though the decision of the Court was only made known on the Wednesday preceding, and notices were only received on the morning of the meeting, a large and representative gathering of automobile manufacturers, and others equally interested in automobilism, flocked to the Welcome Club. Mr. J.J. Mann briefly informed the meeting that in the case above referred to the Court had issued an injunction to restrain the defendant Sherrin from infringing three patents relating to motor-cars. The patents referred to were No. 16,072 of 1893, granted to Wilhelm Maybach for an invention of "improvements in the methods of producing the explosive mixture in hydro-carbon engines"; No. 19,734 of 1895, granted to Count Albert De Dion and Charles Bouton for an invention of "improved means or apparatus for electrically igniting and governing petroleum and other like motors"; and No. 13,671 of 1899, granted to the British Motor Company and Charles Jarrott for an invention of "improvements in or relating to motor-vehicles." Further that the Court had granted a certificate of validity in respect of all three to the plaintiffs, the British Motor Traction Company. Mr. Mann reminded the meeting that the action of the British Motor Traction Company was a breach of good faith, they having agreed to a test action, and, therefore, ought to have stayed further legal proceedings in the matter of the 16,072 patent pending the decision of a similar case down for hearing against Mr. Charles Friswell. He called the attention of those present to the serious effect upon the trade such a ruling of the Court must have, and urged the importance of combination against the company and others referred to as a group, who held or claimed no less than fifty-nine patents for parts essential to the making of motor-cars. He further proposed the formation of a guarantee fund to fight the Friswell case now pending, as a test case, carrying it, if necessary, to the House of Lords. He was informed that £3,000 might be necessary to carry the matter through to the end, and towards this amount the Earl of Shrewsbury and Talbot had promised £500 provided the balance could be guaranteed. Other speakers followed, whose eloquence was in some cases of the fiery order, but concerning the opinion of the meeting there could be no question. That the British Motor Traction Company, and the "group," with their fifty-nine patents, valid or otherwise, must be fought collectively was assured before even the subscription list was opened. Mr. Staplee Firth followed with the legal aspect of the case. He urged the necessity of guaranteeing the necessary funds to enable the Friswell test case to come on at once, as a means of preventing immediate action on the part of the "group" against others interested in the motor-car industry. The advisability of prompt action was emphasised by a gentleman throwing a writ served upon him that day upon the table behind which the speaker stood. More than one hand stole furtively to breast pocket, where, no doubt, a similar dreaded instrument lay, and many eyes turned towards the door as if expecting to see the solicitor's clerk, reported to have been engaged in a game of hide-and-seek in the Hall during the Show. Needless to say that the fund was guaranteed—more than guaranteed, in fact—most of the gentlemen present contributing something, "each in his degree."

The proposed Motor-Car Show to be held at the Crystal Palace in February next was the next subject discussed. That too many Shows were injurious to trade was the opinion freely expressed. On the motion being put that the meeting considered one annual exhibition sufficient, and recommended that the Show of the Automobile Club at the Agricultural Hall should be the only one supported, it was carried unanimously.

THE Motor-Car Exhibition at the Agricultural Hall.

(Continued from page 174.)

A GROUP OF CARS IN THE ARENA.

[Argent Archer.

THE great Motor-Car Exhibition is now relegated to the past tense, to the relief of those firms whose representatives found such a busy week a tiring experience. As one gentleman expressed it: "Even good business becomes monotonous and tiring when you have so much of it." And there was a good deal of activity prevailing from Saturday to Saturday. Several points were made clearly apparent during the week. It was clear that the public have definitely taken to automobiles, that scores of people were waiting till the Exhibition to place orders, and that the summer season will be a very brisk one for those who have cars to sell, and one of great stress for those concerned in the construction. The public were attracted to the Exhibition in crowds, and, arrived at the Agricultural Hall, they became interested, and curiosity developed into purchase in many instances.

Mention may rightly be made of the character as well as the numbers of the attendance. Dukes, lords, and right honourables were there every day, members of the Cabinet whirled round the arena as though they were thousands of miles from the wordy warfare of Westminster, and fashionable ladies evinced as much interest in the mechanism of the motor-cars as they are wont to do in the attractions of a county horse show or a fancy dog exhibition. Members of manufacturing firms, representatives of delivery companies, and tradespeople, who find horseflesh expensive, were also among the purchasers of vehicles—each being suited to his tastes or requirements. Medical men were cautious inquirers throughout the week, and many will develop into purchasers before the end of the month.

As is usual at these displays, no hitch occurred to mar the general satisfaction. The popularity of the arena was as pronounced as ever, and, thanks to Mr. Basil Joy's never-failing courtesy and patient manner, as well as the good humour of drivers, all went merry as a motor bell—so far as that portion of the Hall was concerned. Away in the Minor Hall were crowds throughout the week, and the firms in the Gallery found loftiness of view associated with substantial results. Next year the Gallery will be as full of life as any other part of the Hall, and the accessory firms will doubtless appreciate the provision there made for their reception. Most exhibitors wisely refrained from overcrowding their stands, with the result that visitors could see the cars from all points

without inconvenience. This fact, combined with the care with which the catalogue was compiled, was appreciated by every motorist who visited the Show. Many other reflections occur as we write; but space is limited and we now continue our description of the leading exhibits and the main features on the various stands.

Strikingly original features in many important respects characterise the construction of the cars of the Wolseley Tool and Motor-Car Company, Ltd., Adderley Park Works, Birmingham, of which two specimens, both with *tonneau* bodies, were shown, one fitted with the new 10 h.p. two-cylinder motor, the other a 5 h.p. car with a single cylinder. Except for the different engine, and that the smaller car has only three speeds forward in place of four, the two vehicles are, generally speaking, identical, so that the following description may be taken as applying to both cars. To begin with the frame, this is constructed of one piece of channel steel. The two-cylinder engine, which at 750 revolutions per minute develops 12 h.p., is located in the front, the cylinders are water jacketed, and the ignition is electrical, an extremely simple form of wipe spark ignition being adopted. The roller is encased in an aluminium box, which can be shifted on its own axis for advance or retard in the usual way, and the high tension wire is introduced into the box through a small ebonite screw plug, so that the chances of short circuiting are reduced to a minimum at this point. The water circulation is maintained by a pump, although, by reason of the tanks being above the engine, the water will circulate by gravity should the pump fail. The radiators are of greater extent than usual, enclosing the sides as well as the front of the bonnet, and the capacity, with the two water tanks at each side, amounts to 2½ gallons. An automatic governor is provided, as also a foot-operated "accelerator"; the carburettor is of the float-feed type. A point is made of the fact that the fly-wheel revolves in the direction of the travel of the car. A detail of importance, and making for efficiency, is that the bearings of the crankshaft of the engine are exceptionally long, being four and a half times the diameter of the shaft, thus giving a rigid holding. The designer of the Wolseley engine, Mr. H. Austin, has very positive views on efficient lubrication, and eschews the ordinary splash system, preferring to convey fresh clean oil to every working part by copper conduits giving direct lubrication. Coming now to the

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

transmission gear, this is of the Panhard type, giving four speeds forward and one reverse in the 10 h.p. car, and three speeds and reverse in the 5 h.p. vehicle, all controlled by one handle. A large Renold silent chain transmits the engine power to the variable speed gear shaft, while two roller chains connect the countershaft with the rear road wheels. The wheels on the large car are 34 ins. in diameter, and on the

out at 4 cwt. less, and has a maximum speed of 27 miles per hour. There can be no doubt that a good deal of time, money, and thought have been expended in bringing the Wolseley cars to their present high state of perfection, and we are not surprised to learn that they are meeting with a good reception in the motoring world. Mechanically inclined visitors to the Show paid great attention to the glass case on the stand in which were

FIG. 1.—THE WOLSELEY 10 H.P. TONNEAU-BODY CAR.

5 h.p. 30 ins., in both cases fitted with Clipper-Michelin tires. The wheels are wooden, artillery pattern, and are fitted with hand-applied emergency brakes acting on the rim; a pedal brake is also fitted. Steering is controlled by an inclined bandwheel; the wheelbase of the car is suitably long, with the front axle well forward, being, in fact, just vertically below the front of the radiators. Every detail has been thoroughly considered; a

displayed well-finished samples of the parts of the Wolseley engine and transmission gear.

The Yorkshire Motor-Car Manufacturing Company, Limited, Hipperholme and Bradford, had on view one of their voituettes, and also under-frame for the same. A general view of the car is given in Fig. 3 and a plan view in Fig. 4. The motor

FIG. 2.—THE WOLSELEY 5-H.P. MOTOR.

petrol gauge and tap are fitted on the dashboard, as well as the sight-feed lubricators, and unusually copious splashguards enclose the wheels, the front ones being reinforced with wing flaps on the inside to protect the engine. The 10 h.p. car (Fig. 1) weighs complete about 18 cwt., can attain a speed of thirty-six miles per hour, and with a full load ascend a gradient of 1 in 6. The weight of the 5 h.p. car comes

FIG. 3.—THE YORKSHIRE MOTOR CAR COMPANY'S CAR.

is fixed in the fore half of a cross-stayed girder frame; it is placed at an angle of 25 degrees from the horizontal, and is fitted with valves which are held vertically upon the end of the cylinder. The cylinder is 4½-in bore, and the piston has a stroke of 4½ in.; the normal speed is 800 revolutions per minute. The cylinder together with the valve chamber are water-jacketed. Natural circulation from two oval tanks, placed in front, is employed,

the use of a pump or radiator being dispensed with. Either electric or tube ignition is provided for. A Longuemare carburettor furnishes the explosive mixture, and is itself fed from a petrol tank beneath the seat. The crank-shaft carries a drum from which the power is transmitted to a change-speed gear on a separate counter-shaft by means of a single wide belt. A striking-gear throws the belt from the one to the other pulley,

FIG. 4.—PLAN OF YORKSHIRE MOTOR-CAR COMPANY'S CAR.

and a jockey on the under (and slack) side of the belt serves to tighten it. The change-speed gear provides for three different gear ratios, giving five, ten, and twenty miles per hour. It is operated by a single hand lever on the steering post. Within the two pulleys on the counter-shaft, and enclosed in a dust-proof and oil-retaining case, is an epicyclic train of bevel wheels, one planet-wheel only being fitted. This device provides three different speeds in the following manner:—When the belt is placed on the right-hand pulley it revolves, together with its sleeve, freely on the counter-shaft, but the planet wheel carried by it causes the left-hand pulley to revolve at twice its own speed. Since a two-way clutch is engaging with this latter pulley the counter-shaft is also driven at twice the speed of the pulley which the belt is running upon. This is the high speed. In order to obtain the intermediate speed, the belt is moved on to the left-hand pulley. The counter-shaft then revolves at one half the previous speed. The low speed is brought into action by throwing over the two-way clutch, and this is effected by a connection between the striking gear and the clutch lever. The effect of this operation is to cause the counter-shaft to revolve at one-half the speed of the belt-driven pulley; the pulley is running freely on the sleeve of the other pulley, but it is driving this other pulley and its sleeve, at half its own speed, through the epicyclic train; the sleeve is now clutched to the counter-shaft, and hence the low-speed gearing is obtained. This counter-shaft is connected with the differential gear on the rear live axle by a $1\frac{1}{4}$ -in. pitch Brampton roller chain. The back axle is supported by three ball bearings, two of which are carried by the suspension springs, and the third by a chain-tightening tie rod. Wheel steering is fitted in the centre of the car, so that either rider can operate it. The wheels are 26 in. in diameter, and are

fitted with $2\frac{1}{2}$ -in. pneumatic tires. A foot pedal acts upon a band brake on the counter-shaft when it is pressed backwards; it also controls the jockey pulley which tightens the belt and thus serves to start the car, when it is pressed forward. The car complete weighs about $7\frac{1}{2}$ cwt.

One of the latest Coventry cycle firms to take up the construction of motor-cars is the Swift Cycle Company, Ltd., of Cheylesmore, and judging from the chassis and complete car (Fig. 5) which they had on view, they have given the matter careful consideration before putting their automobile on the market. To begin with the frame, this is constructed of $1\frac{3}{4}$ in. steel tubing. The engine, a $5\frac{1}{2}$ h.p. M.M.C. De Dion water-cooled motor, is supported in the fore part. An extra fly-wheel is carried on the engine-shaft outside the crank chamber; the ignition is electrical, while the water circulation is maintained by means of a small pump carried on a standard on the frame, and driven off the engine-shaft by chain gear. The inlet valve can be adjusted by means of a Bowden wire mechanism from the steering column. In the finished car the motor is covered by a well-shaped bonnet, an ample petrol tank being set behind the dashboard, and a set of radiators carried above the steering rods. From the motor the power is conveyed to the countershaft by a $1\frac{1}{4}$ inch pitch Brampton roller chain.

This shaft is equipped with a compact change-speed gear of the Crypto type, giving two speeds ahead and one reverse, the gear being operated by a foot pedal. From the change-gear shaft a single centrally located chain transmits the power to the rear live axle. Inclined wheel steering is fitted, and a special feature about the car is that the steering gear is all duplicated; that is to say, two rods couple up the short steering-posts, each of which latter is provided with two arms. The main rod from the bottom

FIG. 5.—THE "SWIFT" CAR.

of the steering stem to the wheel is connected to a double arm from the steering-post proper, this arm taking the form of a circle round the steering socket. The steering gear is thus very safe and efficient, one set being sufficiently strong should the other be accidentally damaged. The rear axle is provided with two brake drums carrying band brakes operated by a foot lever, a band brake, operated by the control lever, also being applied to the

differential gear. To prevent the car running back on wheels, a special ratchet arrangement, working on the rear chain wheel, is provided. The hubs of the rear wheels are mounted in a special way to enable them to be readily adjusted or detached. The body, which is mounted somewhat higher than the majority of similar vehicles, has a neat, compact appearance. The car shown was a three-seated spider, but a *tonneau* body can be fitted if desired. The vehicle complete weighs about 9½ cwt., and can attain a speed of twenty-five miles per hour. The road wheels are of the cycle type shod with 3 in. Dunlop pneumatic tires.

FIG. 6.—THE "F.N." CAR.

A neat light car with *tonneau* body (Fig. 6) was shown by the Famous National Automobile Company, Ltd., of Lombard House, George Yard, London, E.C. The car, which is built by the Fabrique Nationale d'Armes de Guerre, of Herstal, Belgium, is equipped with a 6 h.p. engine located in the front portion of the car, under a bonnet, so as to be readily accessible. It is of the vertical petroleum-spirit type; it comprises two cylinders set side by side, and is stated to be capable of working up to 6 h.p.; the cylinders are water-cooled, the circulation being maintained by means of a pump. The ignition is electrical, a special ratchet device being fitted on the steering pillar to advance or retard the sparking. Passing to the transmission mechanism, from the motor shaft to the intermediary shaft the power is transmitted by two belts, and from the intermediary to the rear road wheel axle by means of the usual chains and sprocket wheels. Two mechanical forward speeds and a reverse motion are provided, the variable speed gear being controlled by a single handle mounted on the steering standard. It is claimed that by means of the variable speed gear and the variation of the electrical ignition any speed from zero up to twenty-eight miles per hour can be obtained. The road wheels are of the cycle type, fitted with pneumatic tires. The steering hand-wheel and the speed control handle are mounted on a standard within convenient reach of the driver, provision being also made for the starting of the motor, and also for the tightening of the driving belts from the driver's seat. The car complete weighs between 8 and 9 cwt.

Messrs. R. M. Wright and Company, Mint Street and Bailgate, Lincoln, exhibited one of their "Stonebow" four-seated dog-carts (Fig. 7.) The frame of this vehicle is of channel steel; at the rear it is fitted with a 5 h.p. horizontal motor of their construction. The water circulation is maintained by a pump, and a radiator is provided in the fore part of the frame. In passing it may be noted that every effort has been made to render the parts easy of access, the induction and exhaust valves of the engine being fitted on the top of the cylinder end. The transmission is effected by means of three 2 in. belts working on fast and loose pulleys and a Crypto gear; three forward speeds—ranging from four to eighteen miles an hour—are provided, as is also a reverse motion. From the countershaft a duplicate pair of sprocket wheels and roller chains transmit the power to the rear road

wheels. Wheel steering is fitted, the various levers being mounted on the steering pillar. The road wheels are of the cycle type. The body can be readily detached from the frame by removing four bolts. The petrol and water tanks are arranged under a false bonnet in the fore part of the frame; storage capacity sufficient for a run of 140 miles is provided. A hand-brake on the countershaft, as also emergency shoe brakes on the tires, are fitted. The car, complete, weighs about 12 cwt.

Messrs. Ernest Hutton and Company, Limited, of Ohm Works, Northallerton, confined their exhibit to a single example of their "Simplex" voiturette (Fig. 8). Power is supplied by an M.M.C. De Dion water-cooled motor developing about 5 h.p., and fitted with electrical ignition, arrangements being made that the ignition, air, and gas can be regulated from the driver's seat. The induction valve spring pressure is controlled by a third lever under the usual steering wheel, so that the speed of the motor can be increased, while if the lever be pulled entirely up, the valve acts as a throttle. The water-circulating pump is driven by a small band. The induction coil is placed inside the bonnet, and the batteries are similarly situated. Two speeds are provided, the transmission being effected by a single belt running on wood pulleys. The whole is enclosed by a light cover, which prevents dust and mud reaching the belt. From the countershaft toothed pinions transmit the power to spur gears on the live back axle, one pair being used for each speed. The gearing is made very large, and it is designed to be equal to transmitting more than double the horse-power it is called upon to do. The gearing runs in an oil bath. Steering is controlled by means of an inclined wheel on the right hand side, and two independent and powerful band brakes are fitted, capable of holding the car on the steepest gradients. A novel sprag is fitted, which engages with saw teeth on a wheel on the countershaft, and so holds the car on the steepest hill. The frame is of steel tubing, while the body is of neat design and made largely of aluminium. The starting of the engine is effected by a handle attached to the splash board, which can be actuated either from the ground or from the driver's seat. The wheels are of the cycle type and fitted with 65 mm. pneumatic tires. Messrs. Hutton have a new type of 5½ h.p. car in hand, particulars of which we hope to give in a later issue. On the stand was also shown a specimen of the "Automatic" oil economiser, which

FIG. 7.—THE "STONEBOW" CAR.

affords a ready means of storing liquids, combined with an effectual method of withdrawing and distributing the same without loss. Instead of the usual "draw-off" tap, a pump is employed; by this means loss by leakage or by the tap being left inadvertently open is avoided. Rectangular in form, it is provided with a lid, which, when closed and locked, affords effectual

protection against surreptitious withdrawal, evaporation, and pollution. By the act of lifting up the lid, the discharge pipe is also automatically raised into the proper working position and the well is opened, whilst the closing of the lid also closes

FIG. 8.—THE "SIMPLEX" CAR.

down the discharge pipe and hermetically seals the well by means of a valve.

A very interesting car was that exhibited by Mr. M. Holroyd Smith, of 47, Victoria Street, Westminster, of which an illustration is given in Fig. 9. The vehicle has been built to demonstrate the value of various new and useful improvements, and is the result of a considerable amount of study and research. The design of the car varies from the general practice, but this is a minor question, because with the same engine, gearing, frame work, etc., almost any variation could be made in the shape of the car body to suit the taste of the user. The frame is constructed of ash, plated with iron at top and bottom. The engine, which develops from 6 to 8 h.p., at from 600 to 800 revolutions per minute, and which is located at about the centre of the frame, has two cylinders placed at right angles one with the other (Fig. 10); this disposition has been adopted to lessen vibration. Both

FIG. 9.—MR. HOLROYD SMITH'S CAR.

pistons work on the same crank pin, and the balance weight being in alternate requisition is equal to the weight of one piston. Though all the working parts are enclosed they are easily accessible, our attention being called to the facility provided for examining and adjusting the induction and exhaust valves. Electric ignition is employed with a fresh design of commutator,

the object being to prevent oil finding its way to the contact-making portion. The carburettor has no float feed and embraces the good features of the surface evaporation and the spray method combined; every provision is made for adjustment to suit different loads, varying qualities of petrol and states of the weather. The cylinders are water-jacketed, the circulation being maintained by a direct-driven centrifugal pump of novel construction driven off the crank shaft. The hot water is made to pass through two sets of radiating copper tubes, one fitted with aluminium gills in the usual manner, and the other constructed on a system believed to be new, in which durability and facility for cleansing have been considered. Special attention may be drawn to the method of transmitting the power from the engine to the driving axle, whereby it is possible to obtain any variation of speed between the two extremes of five and fifteen miles per hour. By simply turning a small hand wheel to the right the car goes faster, reversing the movement causing the car to go slower. Another concentric handle on the same spindle starts and stops the car. When in mid position the engine is disconnected from the gearing and the car is stationary.

FIG. 10.—ELEVATION AND PLAN OF MR. HOLROYD SMITH'S ENGINE.

Without a drawing it is somewhat difficult to describe the transmission mechanism. The engine is placed with its crank shaft fore and aft of the car, and drives a cone pulley, from which power is transmitted to a similar but reversed cone pulley by means of a belt, moved by a screw striking gear. There have been many attempts to utilise cones and belts to obtain a variable speed, but hitherto the difficulty that one edge of the belt has a tendency to travel faster than the other has not been surmounted. Mr. Holroyd Smith has spent much time on this point, and has produced an articulated belt which, while giving a grip over its whole width, has practically a central driving line. The reverse motion is obtained by means of grooved friction pulleys. The gear is exceedingly interesting. The lower cone is carried in a fender, and can be raised or lowered, and the engine cut out from the transmission gear or the driving belt tightened as desired. From the speed-varying arrangement power is transmitted to the rear axle by means of a flexibly-

coupled shaft and bevel gearing. Dual brakes are provided, the one for general use being a hand brake on each of the driving wheels, the peculiarity being that the restraining influence is equal on each wheel, and also that the first effect produced by the foot lever is to disconnect the engine from the driving gear. The road wheels are exceptionally strong; in construction they are the reverse of bicycle wheels, viz., that instead of the spokes

FIG. 11.—THE STIRLING VOITURIETTE.

being wires under tension they are wood under compression; the spokes form their own hub, and are attached to the channel steel rim by adjustable nipples. The channel steel rims are fitted with rubber cushion tires shielded by steel shoes secured in a way that has proved most effective in practice. In fact, the set of wheels on the car have run nearly 1,000 miles and show no appreciable wear. Steering is effected by a specially modified tiller whereby no vibration due to roads is communicated to the hand of the driver. The tiller is pivoted so that it can be turned out of the way to give free ingress to the car. By a novel, yet simple, arrangement the tiller is also the signal horn. The car body is fitted with a tool chest in front, and there is ample room under the back seat for luggage.

Considerable interest was shown in the voiturette exhibited by Stirling Motor Carriages, Limited, of Sauchiehall Street, Glasgow, by reason of the relatively low price of the car having regard to its power. The vehicle has previously been described in the *Journal*, but it may be mentioned that it has a four-seated dog-cart body mounted on a tubular frame (Fig. 11). Power is supplied by a 5 h.p. M.M.C. De Dion water-cooled motor with gravity circulation. Two speeds are available, the power being transmitted from the engine to an intermediate shaft by a friction clutch and chain driving, spur gearing connecting the countershaft with the front axle. Side tiller steering is provided, this acting on the rear and not the front wheels as usual. The little car is equipped with cycle type wheels and pneumatic tires and complete weighs about $4\frac{1}{2}$ cwt. The Stirling voiturette has met with an excellent reception in the North, the makers being unable to accept any further orders for delivery before September. In larger vehicles Messrs. Stirling displayed a couple of their victorias. These are well-constructed vehicles, driven by a 7 h.p. vertical engine, located about the centre of the channel steel frame. The ignition is electrical by means of a dynamo and accumulator, while the cylinder cooling water is circulated by a rotary pump. Two speeds are provided, eight and twenty-five miles per hour—as also a reverse motion. The forward motions are obtained by chains and clutches, the countershaft being connected with the rear road wheels by the

usual duplicate pair of chains and chain wheels. The car complete weighs about 12 cwt., and is equipped with artillery wooden wheels and pneumatic tires. One of the vehicles had tiller steering, while the other was of the inclined wheel type, the post of which is hinged to allow of free ingress to the seats.

We generally expect to find something interesting at the exhibit of Mr. Carl Oppermann, of Wynyatt Street, Clerkenwell, and his stand was no exception to the rule. First, we find an electrical victoriette, shown in Fig. 12 below. This vehicle is finished and upholstered in a luxurious manner. The body is mounted on elliptical springs above a flexible under-frame, which connects the front and rear axles, and which is provided with universal joints in such a way as to allow the wheels to suit themselves to any inequalities of the road surface. The wheels, which are 30 in. (rear) and 27 in. (front) in diameter, are of the tangent wire type, and are fitted with steel hubs. Solid rubber tires, 2 in. wide, are used, and the wheels run on roller bearings. The tires are secured to the rims by welded steel wires, and are further held in place at their sides by the rim itself. The front axle is a steel tube which carries a ball-steering head at each end, and the steering gear is of the ordinary type, and is operated by a steering lever through a rack and quadrant. The motor is mounted to swing about the live rear axle, and is also connected to the body of the vehicle. It is of the Oppermann series-wound type and normally develops 3 h.p., although it is said to be capable of standing three times this load for a short time. Steel magnets and a slotted drum armature are used, and the motor is completely closed in; automatic lubrication is provided. The transmission gear consists of a hard steel worm which is carried on the end of the motor shaft, and which meshes with a phosphor-bronze worm-wheel on the differential axle. A lever brake is also fitted which operates upon the tires of the hind wheels; the latter are also fitted with powerful band brakes actuated by means of the driver's foot. The weight of the carriage complete is 18 cwt., and its extreme length 8 ft. The vehicle is arranged for two persons, but a seat at the rear for an attendant can easily be fixed if required. Mr. Oppermann also showed a very neat three-seated dog-cart, which he has named the "Lucania." The vehicle is mounted on his new tubular under-carriage. The new frame and gear is quite self-contained, and is arranged to suit a large number of different types of carriage bodies, and can be fitted up with very little labour. It is made to drive by either the front or rear axle, although the latter is preferred, as being most con-

FIG. 12.—THE OPPERMAN ELECTRIC VICTORIETTE.

venient. The car is fitted with a 3 h.p. motor and a battery of forty-two accumulators, having a capacity of 150 ampère-hours. Steering is controlled by a bar acting on the front wheels. Band brakes are fitted to the rear wheels, operated by a foot lever. An electric brake, actuated by the controller, is also provided. The controller is arranged to give three speeds

forwards, corresponding to 4, 8, and 12 miles per hour, and one speed backwards, all of these results being attained by means of one lever. The chief novelty on Mr. Oppermann's stand was a two-seated "Electric Runabout," which is being put on the market at the low price of £160. This little car is built to carry two persons, and will run a distance of twenty-five miles with one charge of the accumulators. It is very easily managed, is absolutely silent in running, and the speed can be set to four, seven, or ten miles an hour. The wheels and axles, together with the motor and gearing, brakes, etc., are carried on a steel tubular frame, quite independent of the carriage body. The battery consists of thirty cells of the "Flambeau" type, which are always worked in series, the speeds being varied by means of a resistance. The motor is 1 h.p. and drives the hind wheels direct by means of a worm gear, which is entirely enclosed. The carriage is sent out complete with electric lamps, volt and ampere meter, mileage recorder, band and shoe brakes, and safety catch to prevent the car running down hill backwards, hooter, etc. The weight of the car complete is 8 cwt.

A very representative display of electric vehicles, all of which were fitted with the Leecoll batteries, was made by the British and Foreign Electrical Vehicle Company, Ltd., 4, Bloomsbury Place, W.C. Here were handsome carriages, fast "chariots" for long distance purposes, and utilitarian delivery vans, the whole comprising a very noteworthy exhibit. Of general interest was the Columbia phaeton intended to seat three people. With one motor and a 40-cell Leecoll battery it will travel thirty miles on one charge, thus rendering it well suited to city and suburban work. There are three speeds ahead, one reverse, and an electric brake available. Pneumatic cycle wheels have been fitted and tiller steering is also a feature of the vehicle, which has a neat and stylish appearance. Another attractive exhibit on the stand was a Lohner-Porsche car to which either a victoria or brougham body can be applied. This has been previously described in our columns, and it need only be said on the present occasion that the capacity of the battery of forty cells is between twenty-five and thirty miles, while a top speed of fifteen miles an hour can be obtained. Hub motors are fitted to the front wheels and the controller gives five speeds ahead, one reverse, and an electric brake. The

FIG. 13.—THE BRITISH AND FOREIGN COMPANY'S LONG-DISTANCE ELECTRICAL CAR.

delivery van (Fig. 14) was the subject of much questioning during the week, many leading commercial houses recognising its efficient appearance, and deciding to test its merits. Its stated capacity is one ton, but it can carry double that weight. The battery consists of forty cells of large size, and one charge will suffice for fifteen to twenty miles. There are two motors driving the rear axle by means of enclosed spur gearing. The controller is adapted for four speeds ahead, three reverse, and two electric brakes. Wheel steering has been adopted, and solid tires provided. Together with the batteries the van weighs

about $2\frac{1}{2}$ tons. On the stand was a "chariot" designed to carry four people, two in arm-chair seats in front, the others being on a raised seat behind. The body is of partinium. The chariot shown was not equipped with its motors, but the vehicles of this type have two $2\frac{1}{2}$ h.p. motors. Both in the arena and on the stand the Creanche voiturette exhibited by the company secured much notice. A forty-cell battery is provided as also one motor having two armature windings and two commutators. It will run about thirty miles on one charge at a speed of twenty miles an hour or less, while its efficient brake, seven speeds and a reverse are points

FIG. 14.—THE BRITISH AND FOREIGN COMPANY'S ELECTRICAL DELIVERY VAN.

not to be overlooked by those favourably impressed by electric vehicles. The list of vehicles (all fitted, it must not be forgotten, with Leecoll batteries) on this stand was completed by a reference to the Krieger long-distance car (Fig. 13). The fact that it is constructed to journey sixty miles on one charge gave additional interest to the car that was shown. This was arranged to seat four persons, two in seats of the armchair type in the front and two on a high seat behind. Two Krieger $4\frac{1}{2}$ h.p. motors are geared to the front wheels and fifty-cell batteries are located in front and rear. Six speeds are provided by the controller, together with two positions for recuperation. There is a reverse and also an electric brake. Bar steering has been adopted, and the special points include pneumatic tires and wood wheels. The total weight of the car is about $1\frac{1}{2}$ tons.

As is well known, electrical vehicles are the speciality of the National Motor Carriage Syndicate, Limited, of 37, Walbrook, London, E.C. We were fortunate to meet Mr. Joel, who is responsible for their design, and he kindly pointed out to us the special features of his vehicles. We first inspected the "Brighton" electrical voiturette, of which an illustration is given in Fig. 15. There are two Joel 2 h.p. electric motors driving the two back wheels of the carriage by chains acting directly from a small sprocket pinion on the motor axle to a larger sprocket wheel fixed to the spokes of the rear carriage wheel, these chains being adjustable as in a bicycle. The motors are fixed on an independent and "springy" underframe, and as each drives separately there is no necessity for balance gear. The electric motors are of very light weight (100 lbs. each), and slow speed (600 revolutions per minute). These motors will run at quarter, half, and full speed—as required for the carriage, and are made to give 50 per cent. more h.p. for short periods. Carbon contacts or brushes are used on the commutators, and the motors will run either forwards or backwards. The two batteries comprise thirty-six Rosenthal accumulators. The plates are of the pasted type, with special provision for expansion. They are enclosed in perforated cases, and are clamped together by rubber bands. The working efficiency output of these cells is high, being 12 to 15 watt-hours per lb. of complete cell. The capacity of the batteries is 160 ampere-hours; they are placed out of sight half under the front seat and half under the back seat, thus distributing their weight. The controller consists of a single drum, carrying contact blocks, which

complete the necessary circuits successively between the insulated spring blocks. In order to give the drum a rapid action between its various positions, a spring roller is fixed in engagement with a cam wheel, and a pair of flat springs tend to hold it in either of its normal positions by pressing against flats on the shaft. The apparatus is arranged for no less than nine changes, viz.:—(1) Charging position; (2) Low speed reverse (three miles an hour); (3) Electric brakes; (4) low speed ahead (three miles); (5) intermediate speed (six miles); (6) increased speed (eight miles); (7) ten miles speed; (8) twelve miles speed; (9) top speed. The steering and electric controlling are very simple, and there are good brakes, while should, from any unforeseen cause, one set of the batteries or one of the electric motors become damaged, the other set of batteries and the other motor can be used to drive the carriage. The road wheels are of the artillery type shod with pneumatic tires, the weight of the vehicle complete being 17 cwt. This car has made several runs from London to Brighton, over fifty miles, on one charge of electricity, and performed well at the Automobile Club trials of electric vehicles at Chislehurst in November of last year, coming out first with the best results of miles per cwt. of car. An electric coupé without equipment was also staged. This vehicle is in cab form, built of light varnished wood, and intended to seat three persons and one driver. It will be equipped with two of the well-known Joel motors and the Rosenthal battery, exactly as on the "Brighton." Other exhibits at this stand

FIG. 15.—THE BRIGHTON ELECTRIC VOITURETTE.

were a Joel 2 h.p. motor, Rosenthal battery, Joel underframe and controller, particulars of which are given above. The British Steam Traction Syndicate, Limited, of 37, Walbrook, E.C., also occupied a part of this stand with an exhibit of the "Millennium," a preparation for automatically closing punctures in pneumatic tires. "Millennium," which is a liquid of the consistency of cream, is compounded of certain chemicals, which, after having been subjected to a special treatment, form a homogeneous mass possessing certain peculiar properties, which constitute it an ideal substance for automatically and instantaneously closing and hermetically sealing punctures and perforations in tires. It is put up in small collapsible tubes, of which the contents are easily injected into the tire through the valve.

Electrical vehicles are the speciality of the Imprimis Motor-car Company, of 78, Queen Victoria Street, London, E.C., who are introducing the cars built by Herr Heinrich Scheele, of Cologne, into this country. We first inspected a two or three-seated phaeton, having a capacity of from 30 to 50 miles on one charge of the battery, which consists of forty accumulators. Two electric motors are geared direct, one to each of the rear wheels. The controller is adapted to give three speeds forward—the maximum being about twelve miles per hour—and two

reverse motions. Particular attention has been paid to the brake power, while the steering is controlled by an irreversible hand wheel. The car, which is mounted on pneumatic-tired wheels, weighs, complete, about 16 cwt. Another pleasure carriage on similar lines as regards the battery, motors, and controller, was a three or four-seated "Mylord" coupe, fitted with road wheels shod with cushion tires. The Imprimis Company also had on view an electrical delivery van (Fig. 16).

FIG. 16.—THE IMPRIMIS ELECTRICAL DELIVERY VAN.

It is intended to carry a load of about a ton, and is propelled by means of a 6 h.p. electro-motor. The motor shaft is geared to a countershaft by spur gearing, special duplicate chain gearing conveying the power to the rear axles. The battery consists of forty accumulators, having a capacity sufficient to run the vehicle thirty-five miles on one charge. The cells are carried in a box which is supported on springs to overcome the vibration due to the vehicle being fitted with iron-tired wheels. The controller is arranged to give three forward speeds, ranging up to twelve miles per hour, and two reverse motions.

FIG. 17.—THE LOCOMOBILE FOUR-SEATED STEAM CAR.

Two large stands were barely sufficient for the representative and interesting display made by the Locomobile Company, 52, Sussex Place, South Kensington, S.W. The public is becoming familiar with the neat style of this company's vehicles, and the many hundreds of people carried by them round the arena during the week will probably become speaking witnesses to the easy running of the Locomobile. Both two-seated and

four-seated cars were shown, the latter including vehicles similar to that (Fig. 17) supplied to Commander Wells to the order of the London County Council. Further interest was given to the exhibits by the presence of a car without a body top, so that the internal arrangements could be easily seen, thus taking the public into confidence—a concession that elicited hearty approval. There was also a section of a boiler made in the summer of 1899 which has since done duty in a car that has travelled 14,000 miles.

FIG. 18—ELEVATION OF THE "YORK" CAR.

The fact that it is still in good condition will be an assurance to many who have had no evidence of the durability of the boilers fitted in the Locomobiles. An example of the burner and the automatic oil feed, by which those interested might see the ingenious manner in which the pressure of the steam is caused to shut off the oil at a given pressure, was also displayed upon the stand.

The British and Colonial Motor Car Company, Limited, of 38, Snow Hill, E.C., and 14, Baker Street, W., exhibited two and three seated Pieper voiturettes. The motor in the Pieper voiturette is of the 4 h.p. single cylinder vertical water-cooled type. A supply of water sufficient for a 230-mile run is carried in the water tank, which is placed inside the carriage body. From there the water is pumped through the water-jacket of the motor to the radiator, a centrifugal type of pump being employed and driven direct from the motor. Belt transmission has been adopted, and also inclined wheel steering. A single wide belt connects the pulley on the motor shaft to three pulleys arranged on a countershaft. This belt is moved on to any one of the three pulleys—two fast and one loose—by means of a speed handle placed to the left hand of the steering post. The belt can be tightened or loosened by means of a detachable

FIG. 19.—THE "OPHIR." STEAM CAR.

key fitted to the front of the car. By rotating this key the motor is moved backward or forward, thus loosening or tightening the belt. The two outer pulleys each have connected to them spur wheels, meshing with corresponding pinions on the rear axle. Two brakes are provided, and the speeds arranged for are from ten miles and twenty-two miles per hour; these may be varied largely by the ignition timing device. Later in the week two additions were made to this stand. First a latest pattern of the York (Boyer-Prunel) car (Fig. 18). The vehicle is handsomely got up, and has a roomy *tonneau* body. The engine, which is in front, is an 8 h.p. Buchet

of the single-cylinder vertical type. Electric ignition is fitted, and the timing of the ignition is under the same control as that of the De Dion. The working parts of the car follow somewhat upon the lines of a small Panhard—that is to say, chain driving to the wheels is employed, and the countershaft is driven by means of bevel gearing. The gear-box is placed conveniently under the floor boards, and can be got at easily. Three speeds ahead and one reverse are available. The framework of the car is tubular, while the motor is very securely fitted to it. The steering heads work upon ball bearings, and geared wheel-steering is employed. The second addition was the Ophir steam car (Fig. 19 and 20), an American-built vehicle possessing a number of novel features which may be summed up as follows: The running gear, the engine frame construction, engine suspension, the transmission to the driving axle, the brake and the arrangement of the controlling devices. The characteristic of the running gear is that the axles do not consist, as in most steam carriages, of one straight and one

FIG. 20.—UNDER VIEW OF "OPHIR" STEAM CAR.

curved member, but contain a single straight member only. There are two pairs of reaches (arranged in the form of a V), one on each side, the forward end of each pair being combined in a horizontal swivel joint, passing through the front axle a few inches from each steering knuckle. This arrangement, it is claimed, gives great strength and the necessary flexibility to the carriage in passing over obstructions. The wheels are 28 in. in diameter, and are equipped with ball bearings, wire spokes, and $2\frac{1}{2}$ in. pneumatic tires. The body and seat are of extra width, and are made of wood, except the top of the rear box, which is of sheet steel, and has the cross draught flue for the boiler riveted to it. The wheel base of the carriage is 5 ft., and the gauge of the road wheels 4 ft. 8 in. The boiler is placed in the centre of the body, directly behind the engine. It is of seamless steel, 14 in. in diameter and 18 in. high, and contains 405 $\frac{1}{2}$ in. copper tubes. The working steam pressure is 180 lbs. per sq. in. Arrangements are provided

whereby the fire, when the steam pressure reaches 200 lbs., is automatically shut down. A safety valve is placed above the water-line, near the top of the boiler, and is arranged to blow off at a pressure of 250 lbs. into the water tank. There are try cocks located on the side of the boiler, and an auxiliary hand feed pump placed beneath the footboard. The water-glass connections are fitted with the usual automatic check valves, but each check is so arranged that it can be raised off its seat by turning a small lever. The burner is of the pilot type, the petrol pipe not being carried through the boiler, but through the burner itself, and over the flame of the pilot burner. In starting, it operates on the principle of the well-known plumber's torch; a small quantity of methylated spirit is allowed to run down into a small cup beneath the pilot burner, and is lighted, thus heating the burner enough to generate vapour. Upon lighting the pilot burner jet the main petrol pipe leading to both burners is heated, and the main burner can then be lighted. The petrol supply is controlled, in the usual manner, by an automatic diaphragm regulator. But during any stop, while operating the carriage, the main burner can be extinguished and the pilot burner left lighted; as the flame from the latter keeps the main petrol pipe hot, the main burner can be instantly relighted at any time later, regardless of what the steam pressure may be. The engine is of the double vertical cylinder reversing type, with cylinders about 2½ in. by 4 in. It is located in the centre

FIG. 21.—THE HOZIER CO.'S "TONNEAU."

of the body, under the seat, so placed that its shaft extends directly back to the differential on the rear axle, which it drives by means of bevel gear, no chains being used. To allow for the necessary movement of the engine, as the body moves on the springs, the engine is hung from the body frame by two hangers, one on each side. For the same reason there is placed in the steam pipe between the boiler and engine a short piece of vertical pipe, having at each end a ground, steam tight, taper joint, which is free to swivel horizontally. The engine, shaft, and differential are all enclosed in dust-tight cases, the tube covering the shaft acting also as a distance piece between the engine and the rear axle. The feed pump is placed on the outside of the engine casing and is actuated by the rear cross-head, by means of a rocker shaft projecting through the casing. The cylinders are oiled by a single connection sight-feed lubricator; all the other bearings are lubricated by the splash system, two quarts of oil placed in the crank pit being said to be sufficient for about 500 miles. The water tank is extra large, filling the whole of the rear part of the body and surrounding the boiler. It has a capacity of thirty-four gallons, sufficient for a run of thirty miles, has large openings on each side for filling, and is provided, in the pipe leading to the pump, with a combined strainer and filter, which can be readily cleaned by unscrewing a small plug. The petrol supply, about ten gallons, which will run the car from ninety to one hundred miles, is carried in a large seamless, cylindrical tank, placed under the footboard. As the capacity of this tank is over twelve gallons, there is an empty space at the top sufficient to hold the necessary air pressure, thus dispensing with the usual

air tank. As the carriage is operated from the left side, all gauges, water glass, regulating valves, etc., are placed on that side. The steam throttle is operated by a small lever at the side, and the reverse by a pedal, moved by the right heel of the driver and held in forward gear by the action of a spring. The boiler feed is controlled in the usual manner by means of a by-pass valve placed under the end of the seat alongside of the driver's knee. The brake, which is operated by a pedal, acts on a drum on the engine shaft, placed inside the casing at the rear. As

FIG. 22.—PLAN OF ARGYLE VOITURETTE.

the brake consists of two different straps, operated by separate eccentrics on opposite sides of the shaft, it is claimed to be double-acting and very powerful. Loaded, the car weighs about 13 cwt.

The novelty on the stand of the Hozier Engineering Company, Limited, Hozier Street, Bridgeton, Glasgow, was the four-seater *tonneau* (Fig. 21) which was exhibited for the first time. The frame is of tubular construction, in the fore part of which, under a light bonnet, is mounted a 5 h.p. vertical M.M.C. De Dion motor. It is of the water-jacketed type; no pump is employed, the circulation being on the thermo-siphon system. Only a relatively small quantity of water is carried, a radiating coil being fitted around the bonnet. The motor is fitted with a new inlet valve, which controls the quantity of mixture admitted to the cylinder, and enables the driver to run the motor at any desired speed. The engine stays are in the form of bell cranks, and are fixed to the frame, brazed on in such a manner as to make the engine absolutely rigid with the frame. Fig. 22 gives a plan view of the motor and transmission gear. In the transmission mechanism no chains or belts are employed; two forward speeds and a reverse motion are provided, and a speed of twenty-five miles an hour can be obtained. The engine, which is set transversely in the frame, transmits its power through a friction clutch to a train of spur wheels meshing with a similar train on a parallel shaft, a bevel wheel on the

FIG. 23.—SECTION OF HOZIER COMPANY'S CHANGE SPEED GEAR.

rear end of the latter gearing with a bevel pinion on the rear live axle. The gears are all enclosed in oil-containing cases. Ample brakes are provided, there being a hand brake on the countershaft and similar brakes on drums attached to the hubs of the rear wheels. Wheel steering is fitted, while the cycle-type

road wheels are shod with Clipper pneumatic tires. The vehicle complete weighs about $8\frac{1}{2}$ cwt. The Hozier Company also displayed a couple of their well-known two or three seated Argyll voituresses; these are fitted with 3 h.p. and 5 h.p. water-cooled De Dion motors respectively; no pump is employed, but a Clarkson-Capel radiator is fitted in the front part of the

FIG. 24.—THE SERPOLLET STEAM RACING CAR—M. SERPOLLET AT THE HELM.

car. It will be remembered that a car of this type was recently driven by Mr. Warren Smith from John-o'-Groat's to Land's End. The general arrangement is the same as in the 5 h.p. car; the motor is placed in front, the main shaft being at right angles to the axles. To the motor a friction clutch is fitted in conjunction with a band brake; by pressure on a foot pedal the motor runs free, and simultaneously the band brake pulls the car up. The variable gear is arranged to give approximately eighteen, twelve, and six miles per hour; also a slow reverse. The power is transmitted from the gear box to the differential gear on the back axle by means of bevel gear. The road wheels are of the cycle type, 26 in. diameter at the front and 30 in. at the rear, all being shod with Clipper pneumatic tires. The two-seated cars weigh complete about $4\frac{1}{2}$ cwt. The change-speed gear, of which an actual sample was separately shown, is of new design. A sectional view of the device, which is adapted to give three speeds ahead and one reverse, is given in Fig. 23 G is a conical leather-faced friction clutch, mounted on the engine-shaft. The sliding clutch A is mounted on feathers on the hollow shaft which carries the brake drum II, and the propeller shaft J, by means of a universal joint. When the clutch A is engaged with the pinion B (which is mounted on feathers on the friction clutch spindle) no reduction of speed takes place, as the intermediate speed pinion C runs loose on the hollow shaft. When the clutch A is engaged with the intermediate speed pinion-C, the pinion B then drives the countershaft, on which are fixed the gear wheels K and L; this reduces the speed on pinion C, which now drives the car. To obtain the slow speed the clutch A is placed in a centra position, and the slow speed pinion D is moved on the feathers along the countershaft into the slow speed pinion, which is mounted on clutch A. To reverse the car, an intermediate wheel is introduced between the pinion on clutch A and the pinion E on the countershaft. It will thus be seen that the pinions giving the second speeds are always in mesh, and that on the top speed the power of the engine is transmitted direct without the intervention of any gearing. The levers which actuate the different speeds run in slots in specially-shaped cams.

An unusual amount of interest was shown in the exhibit of the British Power Traction and Lighting Company Ltd., York, where a 9 h.p. brougham, a 9 h.p. double phaeton, a 6 h.p. vis-a-vis, and the identical car (Fig. 24) on which M. Serpollet recently won the Rothschild cup at Nice, were staged. In each case the

boiler is arranged at the back of the vehicle, and the horizontal engine is under the footboard. It drives direct on to one shaft, from which power is transmitted by a single chain to a balance gear on the rear axle. An important feature consists in the use of ordinary lamp oil, instead of petrol, for the burner. The working steam pressure can be raised from cold in five minutes with the 6 h.p. size, a couple of minutes more being required for the 9 h.p. and 12 h.p. cars. The steam generator is a flash boiler, and the small tubes are of exceptional strength and thickness. Automatic regulation of fuel and water is provided by connected feed pumps, and a condenser is fitted with an arrangement for retaining the water for further use, so that a run of seventy miles can be accomplished on one charging. As the boiler pressure rises there is an automatic decrease of fuel supply, and it is claimed that even if the water supply is neglected the fire will not suffice to burn the boiler. The steam valve is worked by a pedal, and the car cannot start unless pressure is put on this. The foot, when the car is running, is kept on this pedal, and the harder the foot pressure the greater the quantity of steam admitted to the cylinders, of which there are four to each engine. The tubes of the condenser are each capped at both ends for easy cleaning or

FIG. 25.—THE BAYLEY STEAM MOTOR TROLLEY.

removal, and the whole of the engine and all the steering and pumping gear are secured to a single plate bolted to the frame. In common with other steamers the Gardner-Serpollet is devoid of change speed gears, the control of speed being solely effected by regulating the quantity of steam admitted to the cylinders.

M. Serpollet had been for many years engaged in the perfecting of his steam vehicles, and has succeeded in producing a practicable type which has already met with a large adoption in France. Now that the cars are to be constructed in England we expect to see them become equally popular in this country. The details of the Serpollet system were fully described in our issue of March 30th last.

Near the entrance in the Minor Hall was the stand of the Auto-Machinery Company, Ltd., of Read Street, Coventry, who had a showcase filled with ball thrust bearings, rollers, nuts, pins, steel and bronze balls, etc., all of which seemed characterised by good finish. Cup and cone bearings for motor-cars were also shown. There was also a 5 h.p. "Auto" motor with large bearings. A roller bearing was shown running at 1,350 revolutions per minute and carrying a load of a ton. A valveless circulating pump was demonstrated in action. The Garlio cleaning cloths which will be found useful by motorists were also shown on this stand by the company bearing that name, and whose headquarters are now at Erith, Kent.

The only heavy steam business vehicle shown was that on the stand of Messrs. Bayleys, Limited, of Newington Causeway, Southwark, S.E. The vehicle is (Fig 25), designed to carry a load up to three tons, and, with the addition of a trailer, up to six tons, at speeds of five miles per hour for heavy, and eight miles per hour for light loads. The trolley is 16ft. 9in. in total length by about 6ft. 6in. in width, the wheel base being 9ft. The frame is of channel steel rigidly jointed together by steel angles. Both front and rear wheels are dished, thus providing for any undue side strain which may be thrown upon the vehicle when turning corners and heavily laden. The wheels are constructed

of oak spokes, ash felloes and steel tires. The diameters are 3ft. 3in. and 2ft. 9in., with tires $4\frac{1}{2}$ in. and 4in. in width, hind and front wheels, respectively. Steam is supplied by a water tube boiler, the fuel employed being coke. The working pressure is normally about 200lb. to the square inch. The feature of the boiler is that all tubes are horizontally arranged in radial directions, so that any expansion or contraction on the part of either the inner or outer shell, to which the tubes are secured,

FIG. 26.—THE MARSHALL GEAR-DRIVEN CAR.

throws an equal strain upon the entire series of tubes, thus preventing the possibility of expansion or contraction causing leakage. The steam is slightly super-heated before passing on to the engine and is again super-heated when in an exhausted condition, so that no visible vapour is emitted from the funnel. The engine is of the compound vertical inverted type fitted with single eccentric reversing gear, of 25 h.p., all being completely encased in a dust-proof and oil-tight casing. The power is transmitted from the engine to the hind road wheels by means of tooth gearing. The engine crankshaft carries two sliding pinions with actuating gear, providing for the engagement of either of these with two spur wheels keyed on the main longitudinal shaft, two speeds being thus provided. The rear end of the longitudinal shaft carries a pair of bevelled wheels, which through the medium of differential gearing drive the two transverse countershafts, which rotate in cast steel sleeves. At the outer ends of the countershafts are keyed toothed pinions, which gear into internal tooth rings bolted to the spokes of the road wheels. The reversing gear of the engine acts as a strong brake, thus retarding all forward motion. In addition to this, two other powerful brakes are provided, firstly, a double purchase wooden block brake acting on a cast steel pulley, keyed to the engine crankshaft and actuated by a foot pedal, and secondly, a pair of hand-operated band brakes, by which steel wooden-clothed straps are gripped on the outer periphery of the gear rings mounted on the driving wheels by means of a hand lever. Steering is effected by a hand wheel, through worm and wheel gearing. The water is carried in a tank secured to the frame at the back of the driving wheels; its capacity is 100 gallons, sufficient for a run of three hours. To give additional security to the boiler and prevent any colliding or damaging of the front of the vehicle affecting the steam raising plant, the coke bunker encircles entirely the front of the boiler to the extent of one foot in depth, thus providing room for 3 cwt. of coke, and acting as a buffer to prevent the possibility of an accident.

The General Automobile Agency, of 100-104, Long Acre, London, W.C., exhibited a number of interesting cars; but as these consisted largely of well-known types, no lengthy

description is necessary. The largest vehicle on the stand was a 20 h.p. Mors with a *tonneau* body constructed of aluminium, by Rothschild, of Paris. The engine is of the four-cylinder vertical type, located under a bonnet in the fore part of the frame. The transmission is very similar to that adopted in the Panhard cars, four speeds ahead and a reverse motion being available. A variation of the popular 6 h.p. Darracq car was to be seen in one with a four-seated phaeton body, the entrance to the back seats being by a door at the rear. The Darracq Company are now building a slightly larger car of the same type, but fitted with a 8 h.p. engine, one of which was to be seen at the stand, as was also one of the Decauville Company's 6 h.p. three-seated cars. Further variety was given to the exhibit by a 5 h.p. Peugeot car with reversible front seat and wooden wheels, and a Panhard light car fitted with a 7 h.p. two-cylinder engine; both these vehicles have been illustrated in the *Journal*. In addition to petrol automobiles this company also staged a Petromobile four-seated steam surry. For a full description of this new American car we refer readers to our report of the Petromobile Company's exhibit.

Considerable attention was paid to the stand of Messrs. Marshall and Company, of the Belsize Works, Clayton, Manchester. Hitherto this firm has devoted its energies to belt-driven cars, but has now taken up the construction of gear-operated vehicles, and apparently with a large measure of success. The new car (Fig. 26) which has been built to the designs of Mr. J. J. Mann has a channel steel frame, in the fore part of which, under a bonnet, is set a Buchet vertical two-cylinder motor developing $8\frac{1}{2}$ h.p. Each cylinder is provided with a distinct water-jacket, there being no water-joints. The circulation is maintained by a pump, but the tank is so located that, should the pump get out of order by any means, the water will continue to circulate by gravity. A radiating coil is fitted in the fore part of the bonnet.

FIG. 27.—THE MARSHALL 8 H.P. BELT-DRIVEN CAR.

The motor transmits its power through a pedal-operated friction clutch to a gear box of the Panhard type, giving three speeds ahead and one reverse, controlled by one lever. Special attention has been paid to the question of obtaining a durable gear, the pinions comprised in it being $\frac{7}{8}$ in. wide. From the gear box the power is transmitted by a universally-jointed longitudinal shaft and bevel gearing to the rear live axle. It should here be mentioned that the engine and change speed gear are mounted on a special frame independent of the main frame. The body of the car is of the *tonneau* type, giving comfortable accommodation for four persons. The road wheels are of the artillery wooden type, $31\frac{1}{2}$ in. in

diameter, shod with Clipper-Michelin 80 m.m. pneumatic tires. Inclined wheel steering is fitted; a pedal actuates a band brake on the differential gear, and a hand lever double-acting band brakes on the hubs of each of the rear wheels; a feature of the brakes to which attention may be drawn is that they are metal to metal, so that there is no likelihood of them firing. The new car weighs about $9\frac{1}{2}$ cwt. and can attain a speed of upwards of thirty miles per hour. Altogether this is a powerful, well-built light car, of which much is likely to be heard in the not distant future. In belt-driven cars a new type was to be seen in the 8 h.p. Marshall *tonneau* (Fig. 27). The engine is of the single-cylinder horizontal water-cooled type. Three speeds and one reverse are obtained by means of belts working on fast and loose pulleys, a new feature being the arrangement adopted for changing speed and belt striking, the three speeds and reverse being obtained by a lateral and vertical movement of one handle set immediately below the steering wheel on the inclined steering pillar. The connection between this handle and the belt strikers is made by Bowden wire mechanism. The throttle, sparking, and air levers connected with the motor are also operated by Bowden wires. From the countershaft a couple of Renold roller chains convey the power to the rear road wheels. Provision is made whereby the tension of the chains may be adjusted without interfering with the tension of the belts, the back axle and spring moving on dovetailed slides fixed to the underside of the frame. Tension on the chain is obtained by an adjustable radius rod fitted with locking nuts in the usual way. A new large double silencer with double cylinders in tandem is fitted below the

FIG. 28.—THE CAPEL CAR.

frame. The radiators are set underneath the footboard and below the frame. Special attention has also been paid to the accessibility of the induction and exhaust valves of the motor. Wooden or cycle-type wheels can be fitted, these being shod with Clipper-Michelin pneumatic tires. Both hand and foot brakes are provided. Messrs. Marshall and Co. inform us they have specially designed this car for those who desire, at a reasonable price, an exceptionally speedy car, not only on the level, but on the hills, and one that can be easily understood and kept in thorough order by anyone with the slightest mechanical knowledge. In addition to the foregoing a couple of their well-known type of 6 h.p. belt driven cars were also shown. One took the form of a dog-cart with seating accommodation for five persons. It is fitted with a 6 h.p. horizontal petroleum spirit motor, with electric ignition and water jacket. The circulation is maintained by a small pump, radiating coils being now fitted to all cars. Three speeds forward and reverse motion are available, the transmission being effected by belts working on fast and loose pulleys. The other neat car was the Marshall four-seated *tonneau*, the firm having got over the difficulty of building a body of this type on a chassis in which the motor is at the rear in an ingenious way. This, with the exception of the body, is similar

to the dog-cart, being fitted with 6 h.p. motor, radiating coil, three speeds forward and reverse, etc. It is claimed for these cars that they can make a 200 miles trip without renewing either water or petrol. The differential shaft is mounted on swivelled roller bearings, with the result that the loss of power through transmission is considerably lessened. Belt troubles have also been overcome by using special belts of enormous strength, and an arrangement by which any "stretch" can be taken up in two or three minutes with the minimum of trouble. The road wheels are of the cycle type shod with pneumatic tires.

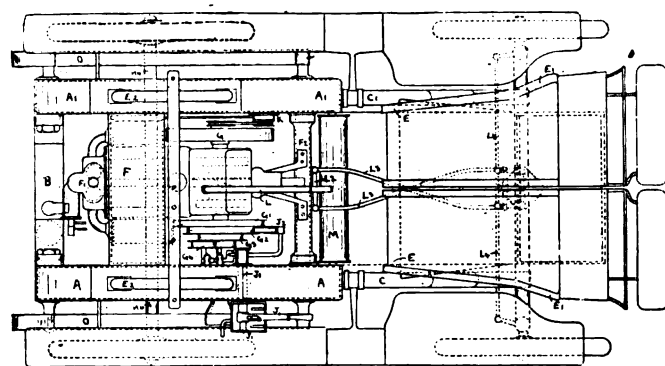

FIG. 29.—PLAN OF CAPEL CAR.

The Creek Street Engineering Company, of Deptford, S.E., exhibited a car built by them to the designs of the late Mr. H. C. Capel, the rights for which they have acquired. The car (Fig. 28), which is adapted to seat four persons, weighs about 9 cwt., is under complete and easy control, and travels smoothly even over rough and uneven roads. The framework is composed of an aluminium petrol tank, A (Fig. 29), and a similar water tank, A₁, which are connected together by the carburettor, B, and the cross-piece F. The tanks are connected rigidly

FIG. 30.—THE CAPEL VARIABLE-SPEED GEAR.

with the tubular framing, they also are attached to the springs O, O, and C, C₁, which carry the back and front axles respectively; C springs also connect the front axle to the frame. The seats, together with their footboards, are fixed separately to tubular frames, hinged to the main body of the car, and are consequently capable of being swung forward,

or of resting in their normal positions upon a bar carried upon the flat springs, E_2 , on the tanks, A, A_1 . By placing these seats in their forward positions, and by removing a cover at the rear of the car, the whole of the propelling mechanism can be readily got at when desired. The motor, F , is fixed horizontally. It has two water-jacketed cylinders, and develops 5 b.h.p. at 750 revolutions per minute. The two connecting rods work upon crank pins, which are in line with one another, and between them is fixed a worm wheel. This wheel drives the cam shaft at half the speed of the crank shaft by means of a worm wheel. The crank chamber is fitted with a cover, which enables the bearings to be taken up when necessary, and this cover is itself provided with an inspection cover. The cam shaft is hollow, and the governing rod passes through and slides within it. The duties of the governor are threefold:—(a) to act upon the throttle valve and regulate the admission of mixture to the cylinders; (b) to actuate the contact maker, which causes ignition in the cylinders, in such a manner as to vary the time of ignition to suit the speed of the engine; and (c) to slide the exhaust cams along their shaft in such a manner that half compression only is attained in the cylinders for starting the motor by hand below a certain speed. The governing rod is fitted with a spring at either end, that at the right-hand end being weaker than the spring at the other end; the governor acts against the stronger spring. A hand lever enables the driver to regulate the

FIG. 31.—THE "PETROMOBILE" STEAM CAR.

normal engine speed. The inlet valves are actuated automatically, and are both held in place by means of a cover, which is fixed by a single nut; they are thus readily removable. The exhaust valves are placed immediately below and opposite to the induction valves; they can be examined when the inlet valves are lifted out. The exhaust valves are operated positively by means of cams and a rocking lever, L . The variable-speed gearing is seen in Fig. 30. The motor shaft carries four leather-covered pulleys of different sizes, G_1, G_2, G_3 , and G_4 ; the first three of these are connected by slack chains with three different sized pulleys upon the counter-shaft, H . Either of these three chains can be caused to tighten and to transmit power from the motor to the shaft, H , by means of the jockey pulley, J_2 . This jockey pulley is carried upon a rocking lever, J_1 , and can be caused to tighten whichever chain it is placed against by means of the hand lever, J . The lever, J_1 , is capable of sliding longitudinally, and can consequently be made to tighten either of the three chains, according as to whether the hand lever, J , is drawn over a toothed quadrant. The lever can be locked in either forward driving position. The pulley G_4 provides the reversing gear. The chain which it drives only presses against a portion of its periphery; it passes over an idle pulley, G_7 , which is adjustable, and round a jockey pulley, G_4 .

This chain also encircles a pulley on the shaft, H . The reversing gear is actuated by means of the hand lever, J , and is brought into play by rocking this lever in a backward direction. Whatever the longitudinal position of the levers, J and J_1 , the projection, J_2 , upon the latter, is capable of tightening the reversing chain. The counter-shaft, H , is fitted with a pair of gear wheels which drive the planet wheels, H_8 , of the differential gear, on the

FIG. 32.—DIAGRAM OF "PETROMOBILE" FORE-CARRIAGE.

rear "live" axle, H_1 , by means of the intermediate gear wheels, H_2, H_3 , and H_4 . The whole of this gearing is enclosed in a dust-tight case. The distance between the motor-shaft and the counter-shaft, H , can be adjusted by means of a swinging link, and the relative motion of the back axle and of the motor-shaft is compensated for by means of this construction. The motor-shaft is fitted with the fly-wheel, and with a chain wheel, which drives the rotary pump, circulating the cooling water through a radiator in the front of the vehicle.

The steering gear is particularly ingenious. The hand lever is so placed that the driver's left arm rests upon it; and is so arranged that it points in whichever direction the vehicle will move. The change speed gear is calculated for four and a-half, twelve, and twenty miles an hour. The capacity of the water system is six gallons, and that of the petrol tank is five gallons. The "accelerator" and gas control are operated by means of Bowden wire mechanism. The road wheels are of the cycle type, shod with pneumatic tires.

Among the several new steam cars which made their appearance at the Show was the "Petromobile" (Figs. 30, 31, and 32). This car, which in America is known as the "Kiddier," has been introduced into this country by the Petromobile Company, of 5, Thavies Inn, London, E.C., and Colne, Lancashire. As the vehicle comprises a number of new features, the following description may be of interest. The frame of the vehicle carrying the machinery is mounted on springs, the under-frame being thoroughly flexible. The front axle is tubular and trussed and has steering forks with inclined pivots, bringing the prolongation of the centre line of the pivot at the ground near the point of contact of the wheel, with the view of insuring the much-desired irreversibility of the steering gear. The inner part of the rear axle is unbroken and of the same cross-section extending from outside to outside of wheels. On this axle is mounted in the centre a differential gear, the bevel wheels of which are riveted to bushed steel tubes, which pass through

FIG. 33.—THE "PETROMOBILE" ENGINE.

the axle bearings and serve as the driving sleeves. The front and rear axles are held parallel to each other by means of two wooden reach bars, which by means of metal fittings fasten pivotally to the bearings on the rear axle and to the steering fork castings on the front axle. An elliptic front transverse spring is used, fastened to a pivoted spring block. A casting fastened to the upper part of the spring is provided with a groove in which the pivot stud may slide. The triangular frame is fastened to this

casting in front and to the elliptic springs in the rear. By means of triangular distance rods between the frame and the rear bearings the possibility of a lateral swing of the rear springs is avoided. The boiler, which is claimed to be unburnable, is of the upright tubular type, 16 in. in diameter and 18 in. high. The outer shell is constructed of best steel boiler plate, 7-32 in. thick. Three hundred and twenty-six copper tubes of $\frac{1}{2}$ in. diameter and No. 20 Stubbs gauge are used, giving an effective heating surface of 56 sq. ft. A baffle plate, fitting closely around the tubes, is placed in the upper part of the boiler, with a clearance of $\frac{1}{2}$ in. all around between it and the boiler shell. The

FIG. 34.—THE NEW YORK TIRE.

object of this baffle plate is to prevent priming. There is a raised fusible plug in the crown sheet which will melt if the water should ever become less than 2 in. high in the boiler. The steam that would then issue from the opening of the plug would smother the fire and prevent injuring the boiler. The water and air pumps are placed on top of the engine cylinders, and are operated from the crank shaft. The feed is regulated by a by-pass, and the air pressure in the fuel tank is regulated automatically at 40lb. per square inch by a valve. The fuel tank is of steel, tested to 300lb. pressure per square inch. Thick annealed copper pipe only is used for all fuel and air connections. The capacity of the fuel tank is eight gallons, sufficient for 100 miles, while the water tank holds thirty gallons. The boiler is fired by a petrol burner; 40lb. air pressure in the fuel reservoir is automatically maintained by the engines, without hand pumping. The burner, an improved application of the Bunsen principle, is automatically regulated by the steam pressure. The working pressure is 170lb. per square inch, the "fire" being automatically lowered at 200lb. A cylindrical feed water heater, 4 $\frac{1}{2}$ in. by 17 in. long, with an enclosed coil of 20 feet of feed water pipe, receives the exhaust steam direct from the engines, thence discharging it to the condensers. These embrace 70 square feet of air cooling surface concealed within the body, and so nearly complete the condensation of steam as to entirely prevent noise, and to permit no objectionable escape of vapour to the atmosphere. The boiler feed pump is nearly automatic, a by-pass under perfect control returning any surplus to the water tank. An auxiliary hand pump is supplied for filling the boiler whenever desired. The hand pump is easily operated against any boiler pressure up to the maximum. The water gauge glass is metal encased except a view slit front and rear, well protected from injury. A water column with three gauge cocks is combined with the gauge outside. Two separate single cylinder horizontal reversing engines, having cylinders 2 $\frac{1}{2}$ inches diameter by 3 $\frac{1}{2}$ inches stroke, developing 6 h.p., are used, placed one on each side of the boiler. The common crank shaft of the engines is carried on the rear axle, and distance rods are employed to keep the distance between crank shaft and cylinders constant. Provision is also made to overcome any torsional actions of the springs. The crank shaft is forged with an enlarged diameter part in the middle, on which teeth are cut, and this pinion gears directly with the gear on the differential rear axle.

The body is adapted to seat four persons; the road wheels are of wood, 30 inches diameter in front and 31 inches in the rear, fitted with New York tires. Steam can be raised from cold within five minutes of lighting up. The total weight of the car, with fuel and water, is 1,000 lbs.; it can attain a speed of seventeen miles an hour, and ascend any hill at a good speed. A double-acting pedal-operated band brake on the differential gear is provided, while it is also intended to fit hand brakes acting on the hubs of the rear wheels. At the stand of the Petromobile Company was also shown the New York tire (Fig. 34), which is being introduced into this country by the New York Tire Company, of 5, Thavies Inn, London, E.C. The tire is of the single-tube pattern; but an inner tube of rubber is vulcanised to the outer cover, which has very heavy walls of fabric and pure para. There is but one inch (diameter) cross section of air space in the centre, the rest of the tire being material built up to 3 $\frac{1}{2}$ inches diameter cross section. The outer cover is pure para about $\frac{1}{2}$ inch thick, next inside of which come layers of fabric wound transversely all around the tire. This is done to cause the grain of the fabric to run diagonally in opposite directions, which, it is claimed, prevents any ordinary punctures. The tire will stand enormous air pressure, and is claimed to be very resilient. The tire has been fitted to several English cars which have been running for several months, and as yet none have been punctured. A cut tire may be re-vulcanised at a small cost, which makes the tire as good as new. The tire is being made in sizes up to 4 in., and for wheels up to 42 in. in diameter.

Considerable interest was centred in the Minerva motor-bicycle (Fig. 35) shown by Mr. D. Citroen, of 45, Holborn Viaduct, E.C. The motor is of the air-cooled single cylinder petrol type, and is of 1 $\frac{1}{4}$ h.p. It is fixed with four screws below the tube extending from the ball head to the bottom bracket of the main frame, and the box containing the carburettor and petrol tank is attached to the horizontal tube by two loops. The box also carries the battery and induction coil, the latter being thus protected against wind or rain. At ordinary speed the engine runs at 1,500 revolutions per minute, equal to about twenty miles an hour. By varying the sparking and mixture

FIG. 35.—THE "MINERVA" MOTOR BICYCLE.

any speed from five miles up to thirty-two miles per hour may, however, be obtained. The motor shaft carries at its end a small pulley, which is connected by a strap to a light pulley attached to the rear wheel. The engine, petrol tank, and driving arrangement weighs complete about 40lb., and can be fitted to any bicycle having a frame from 23 in. to 26 in. The bicycle weighs complete 66lbs. Included on the stand was an interesting section of a Minerva motor, and also a frame showing all the various parts of the engine in detail.

A couple of the two-seated tandem voiturettes (Fig. 36) made by the Century Engineering and Motor Company, Limited, of Willesden Junction, were shown. The frame is of tubular construction and is so designed that its strength is concentrated in the driving line, which is parallel to the road. The drive of the engine

is transmitted direct from the axle of the back or driving wheel to the axles of the two front or steering wheels. The riders are seated tandem fashion, the front seat, which is upholstered in good style, being suspended upon C springs, the back seat being in keeping with same and arranged for the convenience of the driver, and both are so contrived that they are perfectly secure and comfortable for the longest journey. The weight of the

FIG. 36.—THE CENTURY TANDEM VOITURETTE.

riders is carefully disposed with regard to the centre of gravity, so that it is claimed to be impossible by any ordinary or fair means to upset the machine. Power is supplied by either a $3\frac{1}{2}$ h.p. De Dion, $4\frac{1}{2}$ M.M.C. De Dion, or 5 h.p. Aster water-cooled engine. Electrical ignition is employed, while the carburettor is of new design, positive in action, and differing materially from other known varieties. The gas and air valves are worked by one lever only, it being claimed that the carburettor is perfectly reliable under the most adverse conditions of roads and weather, consuming the petrol to the very last drop, even if of inferior quality. The carburettor is carried in front of the footboard, and has been considerably increased in size. Three circular wicks dip into the petrol, and these, with the area of the spirit in the bottom of the well, give a very large surface for evaporation. An ample radiator is set below the frame between the steering wheels. The water tank forms the pillow rest for the head in the front, and the petrol tank the seat in the well-suspended forward carriage; the batteries or accumulators are carried in a convenient box also beneath the seat. The water circulation is maintained by a gear-driven pump. The engine can be set in motion whilst disconnected from the machine by a key operated by hand, and on connecting up with either gear the machine will start straight away from a standstill without recourse to pedals. By means of a novel friction clutch very stiff gradients can be ascended by applying the low gear, or a great speed obtained with the high gear. Owing to the provision of a free-wheel device the engine can be disconnected from the machine, or the machine from the engine at will, and the riders can coast down any gradient like on ordinary "free-wheel" bicycles. The whole arrangement is operated by hand in a simple manner, and can be applied at any moment without jerk or shock. The power of the motor is conveyed to the countershaft by means of a chain, and thence by two chains to the single rear wheel, one or the other of the two speeds being thrown into action by means of the double clutch which is actuated by a lever at the left-hand side of the rider. Renold solid block Silent chains are used throughout. An average speed of twenty miles an hour can, the makers claim, be maintained if required on a whole day's journey in give and take country; while a much greater speed is obtainable for racing purposes. Steering is controlled by means of a lever operating the two front or steering wheels, which are coupled together and so arranged that they incline at varying and correct angles according to the circumference of the radius of the turn. The steering by this means is stated to be rendered so safe that it is possible to negotiate sharp turns at high speed with perfect

ease and safety. The tendency of the engine is to drive the machine in a perfectly straight line, it exhibiting no inclination to deviate from its course unless actuated by the steering lever. The wheels are 28 in. in diameter and shod with $2\frac{1}{2}$ in. pneumatic tires. Two powerful band brakes are fitted, which enable the driver to bring the machine to a standstill in a very short distance. Two drums are carried on the driving wheel axle, the straps round which are applied by a foot pedal and a lever set on the left-hand side of the seat respectively. The reservoirs for petrol, lubricating oil, and water have a capacity sufficient for about 150 miles. The weight of the machine complete, and fully equipped for a long run, is about 4 cwts. One of the tandems was finished in black and gold enamel and the other in aluminium enamel. Both were practically alike, except that one was fitted with a $3\frac{1}{2}$ De Dion and the other with a 5 h.p. Aster engine. We understand that, in addition to complete machines, the company are selling all the parts of the vehicle, including the carburettor, pump, and countershaft, a fact which will be of value to agents and makers.

The Hudd Syndicate, of 27, Fumival Street, London, E.C., had a very interesting display of their specialities. Of these we have recently described in detail the "Hudd" sparking plug, the "Hudd" starting valve, and the "Hudd" two-cylinder balanced motor, so that it is unnecessary to refer to them at length on the present occasion. Fig. 37 gives a view of the "Hudd" carburettor, which may be described as a constant level spray carburettor without a float feed. Its great feature is that at all speeds one uniform mixture is obtained, the eddy currents existing in carburettors with projecting jets being absent. The constant level petrol vessel A receives through the hole C a small quantity of petrol at each suction stroke of the engine, by means of a small pump, or oscillating cock, any excess being carried away and back to the petrol tank by the pipe B. On the suction stroke of the engine, air, previously warmed by the exhaust, enters the carburettor through the opening G, and, passing through the cylinder of wire gauze H, is freed from dust, and, in the constricted passage above, meets the jet of petrol issuing from the small hole D, which communicates with the petrol vessel A. The explosive mixture thus formed passes by the valve E, and through the opening F, to the cylinder or cylinders of the engines. The valve E, by

FIG. 37.—THE "HUDD" CARBURETTOR.

throttling, determines the amount of mixture allowed to enter the cylinders, and may be directly actuated to control the speeds or may be controlled by a governor. The petrol, being always heated, is claimed to be perfectly carburetted even if it is somewhat stale. Another new article is the "Hudd" compression

cock (Fig. 39). It is claimed to have the great advantage of getting rid of the annoyance of obtaining explosions with the cock open, but failing to do so when closed. In other words, the mixture is exactly the same whether the compression cock be open or closed. The nozzle carries a steel cage containing a steel ball, which rests nominally on the nozzle itself, and prevents air entering the cylinder on the suction stroke. On the compression stroke, however, relief is given as usual. The cock may be fitted to motor-tricycles, quads, and bicycles, and will, it is claimed, prevent a lot of the trouble experienced when using the ordinary compression cock. It is

FIG. 38.—THE "HUDD" IGNITION GEAR.

supplied screwed to De Dion thread. Finally we may refer to the "Hudd" ignition gear (Fig. 38). It is a well-known fact that the speed of the petrol engine can be increased by making the point of ignition earlier. The new gear automatically adjusts the point of ignition for the highest efficiency, and consists essentially of a centrifugal governor of a special character. Two weights, W.W., are supported on curved flat springs S; these springs are the great feature of the gear, for they are thin at the ends where they are supported by the drum D, and thick near the weights. In small sizes, the springs are made up of several plates, as shown. The movement of the weights is communicated to the cam C, determining the spark by two steel tapes T. While the motor increases its speed, the springs, bending for the most part near the drum, gradually change their curvature to that of the drum, so that the effective length of the spring shortens, and at the same time its thickness increases. The effect is such that the cam moves at such a rate that the engine is perfectly timed for ignition at all speeds.

FIG. 39.—THE "HUDD" COMPRESSION COCK.

Boldly placed in the Arcade, the Sirdar Rubber Company, Ltd., 36, Duke Street, E.C., took advantage of the four sides of their square stand to show their solid and pneumatic rubber tires in sections, so that motorists could readily understand the construction of their tires. Sections of two sizes of the Irel Buffer tire (Fig. 40) for motor-cars were exhibited. In this the rubber is

compressed, and looking on the top of the tire when in position on a wheel the rubber out of the rim is as wide as the felloe and half as wide again as an ordinary rubber for a felloe of the same size. The rubber does not overhang the edges of the rim, so that it stands no risk of being cut by them. None of the deep cushion of rubber is interrupted by the edges of the rim and as all the rubber below the rim supports the wearing surface durability with comfort is claimed as a leading feature. The rubber out of the rim is narrower than the mouth of the rim, so that the weight of the car alone is sufficient to force it into the mouth, thus obviating all fear of creeping, and increasing the security in proportion to the strain. The tires are made in all sizes for motor-vehicles generally. Treads and covers for pneumatic tires were also exhibited.

The "Williams" rubber tires were shown by Mr. R. Stanley Seyler, who has temporary offices at 17-18, Great Pulteney Street, Piccadilly, W. These tires are constructed on a new principle, and while not being pneumatic are more resilient than solids. They can be affixed, detached and adjusted very easily in a short time. The outer tube has a hollow channel with a lining of

FIG. 40.—THE SIRDAR CO.'S BUFFER TIRE.

canvas, surrounding which are cords imbedded in the rubber, securely sewn to an open mesh into which the rubber is still further forced. By this means a compact body of great strength and elasticity is obtained while the lengthening of the tire is prevented. At the same time the tire lends itself freely to compression. The cord which encircles the tire and actually forms part of it is intended to resist the side strain, and experiments have shown that when the tire is on the wheel with the full weight of the car and load on it, five of these coils are contained in the portion resting on the ground at one time. A side pressure of three tons would be necessary to break them, a strain they are scarcely ever likely to be expected to bear. The core fills up the centre channel from top to bottom, but leaves a vacant space on each side, and its circumference or length is restrained by a patent process of knotted cords that are unstretchable and freely adjust themselves to the side expansion. In connection with the tire is employed a band of metal perforated with indentations at short regular intervals throughout its length. Its two edges are inserted into two split zinc polished tubes which

present a rounded surface of non-injurious metal to the inner wall of the tire. These zinc tubes have on the under surface recesses at regular intervals alternating with the indentations in the band. When the band with the tubes is drawn closely round the wheel the substance is pressed into the cavities which thus form a series of grips at regular intervals round the whole length of the tire, rendering it immovable. The band is fastened by a key, by means of which the tire can be adjusted or removed. The novelty of the Williams' tire attracted many people to the Gallery.

The Monarch Motor Company, of Manor Road, Teddington, and 39, Eastcheap, London, E.C., confined their exhibit to a 12 ft. launch fitted with a 1 h.p. Monarch petrol motor. The motor is of the two-cycle type, and is fitted with an improved magneto generator, which gives a constant current to the ignition. Connected with the engine is a two-speed gear by means of which the launch can be driven at any speed from two to seven miles per hour. In addition to launches we hear that the Monarch Company are about to enter the motor-car industry.

The feature of the exhibit of M. Cormery, Baugé (M. and L.), France, was two wall diagrams illustrating the Cormery car, and which showed the vehicle to be constructed with four wheels arranged one centrally at each end, and a pair at the middle, one at each side. The end wheels are both employed for steering purposes. A drawing showing the Cormery two-cycle petrol engine, recently described and illustrated in these columns, was also to be seen.

Water-cooled heads for the De Dion motor were exhibited among the accessories on the stand of Messrs. Gianoli and Lacoste, 26, Boulevard Magenta, Paris. Here were to be seen the well-known Leclanché batteries, and also some good types of induction coils, including some in which the contacts are covered in to prevent the wet getting to them. Among other novelties we noticed a contact breaker for four-cylinder motors, the coils of which were assembled in a neat case. A similar device is also constructed for two-cylinder motors. A very ingenious water circulating pump was shown, in which a bronze circular block is mounted eccentrically on a spindle, and rotates in the water space, which is divided by a reciprocating shutter located between the inlet and outlet, so that the water has no choice but to pass forward to the cooling apparatus in due course. A small carburettor for motor-cycles, in which the petrol is admitted through a needle valve opened by the suction of the piston, also attracted some attention. On its way the spirit passes through metal gauze discs, and over a corrugated cone. Air is admitted above and below these parts, and means are provided for passing some of the exhaust gases through, so as to warm the apparatus.

The Sinclair Motor-Car Company, Sinclair Road, Kensington, W., had an interesting stand, where a couple of cars in various stages of completion were shown. The smallest is fitted with a 5 h.p. two-cylinder horizontal motor with the heads arranged forward, and water-cooled. The power is transmitted for ordinary driving to the balance geared axle through spur gearing adapted to give two speeds. The motor and gearing are located just in front of the rear axle, and the carriage work is so arranged as to leave the parts readily accessible. A special feature consists in employing two sets of springs in front, so that the body is mounted quite independently of the machinery. The 10 h.p. car has a two-cylinder vertical motor arranged in front, and transmits its power through a flexible shaft to a variable gear, providing two speeds either forward or backward, a Champion friction clutch being employed. The differential gear axle is provided with a bevel wheel, with which a bevel pinion at the back of the variable-speed gear engages. This vehicle is provided with roller bearings, and also with the separate body suspension above referred to. We hope to deal with the Clift cars more fully in a later issue. Other exhibits on the stand included the Sinclair ignition cells, the Diamond centrifugal water-circulating pump, which, running at a speed of 1,300 revolutions per minute, will deliver 600 gallons of water per hour.

Mr. F. C. Blake, of Ravenscourt Works, Hammersmith, who is well known in the automobile world for his electric ignition

apparatus, showed his largely-used induction coils for the ignition of the charge in motors. They are fitted with large platinum-iridium alloy contacts for continuous and heavy work, and the secondary winding is protected from damp and mechanical injury by a strong light covering from end to end. The coils give a very bright flaming spark, and are largely used by owners of motor-cars. Dry batteries, small accumulators, sparking plugs of various types, exhaust silencers, dynamo and switchboard for charging accumulators, etc., were shown. Of the petroleum-spirit motors made by Mr. Blake, a two-cylinder horizontal engine giving $3\frac{1}{2}$ h.p. was shown. It is fitted with water jacket, electrical ignition, and the cranks are set so that there is an impulse every revolution, and, by carefully balancing, vibration is reduced to a minimum; the normal speed ranges from 700 to 800 revolutions per minute. Special attention has been given to the question of lubrication, the cranks working in an oil-containing chamber. Of special interest to motorists is the new rubber insulated wire for tricycles and quadricycles. The wire with its covering is exceedingly flexible, and, it is claimed, absolutely impervious to wet and other causes of short-circuiting. A novelty in carburettors, which is said to possess all the good points of a jet carburettor, but without float feed, was also shown by Mr. Blake. As much interest is just now being taken in carburettors, we hope to refer to the new device at length in a later issue. On a corner of Mr. Blake's stand, the Taipō Accumulator Company, Ltd., of 30, Church Street, Chelsea, S.W., exhibited some of their ignition accumulators, the claims for which are efficiency, lightness, compactness, and indestructibility, the mechanical construction of the cell being claimed to be such that it is impossible for the active material to become disintegrated.

Le Carbone (late Lacombe and Cie.), of Levallois-Perret, Paris, and 36, Lime Street, London, E.C., had an interesting display of electric accessories for use in connection with motor-carriages. Chief among them may be mentioned the "Sans-pareil" dry battery for use with the ignition apparatus of petroleum-spirit motors on carriages, yachts, tricycles, bicycles, etc. It is claimed for these cells that they give the maximum output for the minimum of weight and dimensions. The cells offered for tricycles, with suitable coils, will last between 300 and 500 working hours, according to the conditions in which they are employed. Le Carbone Company also makes a speciality of carbon brushes, and exhibited a new French coil. The concern is now making dry batteries for use on large cars done up in neat oak boxes. These specialities have lately been reduced in price, but the original standard of excellence has been maintained.

Lubricants for motor-cars formed a great feature of the display made by Messrs. Stern Bros., 57, Gracechurch Street, E.C. Among the specialities shown were Sternoline lubricant for the bearings, Fram lubricant for the axles, Sternoline motor-car oil, Sternoline cylinder oil, Sternoline rust preventative, Sternoline elastic paste for gearing, cog wheels, chains, etc. This latter must be applied in a liquid state to chains and cogs. It cools rapidly, and forms a strong, smooth surface which neither comes off nor blisters. The makers claim that the use of this elastic paste diminishes wear and avoids all direct friction. Dust will not mix with it, so that the cogs are kept perfectly clean, and although quite dry in appearance they are well lubricated. As the paste is entirely free from acids and all impurities, its elasticity is easily preserved and it will not harden. Motorists generally seem to be giving much attention to this speciality. Another speciality at this stand was Stern's adhesive belting bricks, which are made in a very compact and handy form, and are very clean. They prevent the belts from slipping or coming off the pulleys, keeping them pliable and counteracting the looseness produced by stretching.

Samples of genuine Michelin pneumatic tires, ranging in size from 65 to 120 mm., were shown at the stand of the Clipper Pneumatic Tire Company, 164, Clerkenwell Road, E.C. These tires are so well known by reason of the popularity they have attained in France, that it remains but to be said that the Clipper Company has secured the sole right to import and sell them under the terms of their licence under the Bartlett patents. A convenient price list has been prepared showing the sizes required

for cars, voitures, and motor-cycles of different weights, and the full range of accessories for motor tires on the stand included repair outfit, foot pump, motor jacks to lift up to 3,000lbs, inflator tubing, etc.

Although the Gare Patent Cushion Tire Company, of 15, St. Vincent Street, E., supply their well-known tires for every conceivable kind of vehicle, they have recently turned their attention more particularly to those for motor-cars, and with good results. Those which we inspected were light, serviceable, and neat. The rim of the wheel is of the steel channel order. Inside the channel is a rubber pad, and round this runs a D-shaped tube. Over this, as an outer covering, is an endless steel band, which forms the wearing surface. By this process of construction weight is distributed over a very large surface of the rubber—almost half the circumference of the wheel, in fact—and even under a heavy load jar and vibration are greatly reduced. The Gare Company have also a patent wood pavement which possesses many advantages which should commend it to motor-car builders for use in showrooms and workshops. The blocks are laid in sections bound together by iron rods, which secure a larger distribution of weight and prevent absorption. Lifting by expansion is impossible, and sections can be reversed when worn on one side.

The Doe Portable Electric Light and Power Company, Ltd., of 122, Cannon Street, E.C., and Ravenscourt Square, Hammersmith, were in evidence with primary batteries for ignition purposes, for lighting, or for charging accumulators, specially designed for motor-cars and cycles. Durability and facility in recharging, for which the "Doe" electrolyte and zincs are used, are two strong points in their favour. The simple and rapid process of charging accumulators from the Doe primary battery was practically demonstrated. A "BY" four-cell battery for ignition, charging accumulators, or lighting two lamps, is remarkable because of the small dimensions into which these many and combined possibilities are packed. The measurements, which are only 4½ in. by 4½ by 6½ in., render it particularly serviceable to the motorist, for whom it has been designed. The company had also on view a good selection of electrical fittings, which included voltmeters, ammeters, and induction coils, the latter producing sparks of any length up to 8 in.

On entering the Minor Hall the eye was caught by an artistic display of posters; needless to say they were French. How different would be many an English landscape and hoarding—so woefully disfigured by the ubiquitous bill-poster—if he would but take a lesson from his brother across the Channel. It was to Madame Lockert, the talented editress of *Le Chauffeur*, the oldest technical journal in France, which has its home at 26, Place Dauphine, Paris, that we were indebted for this passing glimpse of the French billposter's art. In the Gallery was a still larger display, which, though somewhat skyed, attracted a constant crowd.

Beneath these pleasing specimens of their country's art foregathered a small colony of French exhibitors; first amongst these was Madame Lockert, who represents her own journal, *Le Chauffeur*, the recognised organ of the motorist in France. Madame Lockert is a large-hearted woman, and kept a motherly eye on certain other exhibits in the colony.

A temperature regulator, for industrial and domestic purposes, was one of these fortunates. The appliance is the simple but ingenious invention of M. G. Dorain, of 114, Boulevard de Belleville, Paris, and by its use it is possible to ascertain the exact temperature registered at any moment of day or night, the instrument being a self-recorder.

Here, too, was to be obtained the "Annuaire Général de l'Automobile," published by MM. Thevin and Houry, a most useful guide to all who would have a world-wide knowledge of motor-car development.

Artistic designs for motor-cars by M. Emile Gorey, of 1, Rue Christine, Paris, were also on view. Builders in search of style and finish should certainly look into the productions of M. Gorey, who has a large connection among automobile constructors in France.

(To be continued.)

EXHIBITION ECHOES.

THE Right Hon. A. J. Balfour has become such an ardent automobilist that it was only natural to expect that he would visit the Exhibition. This he did on Friday last week, accompanied by his brother, Mr. Gerald Balfour, and his niece, Miss Balfour. The party devoted great attention to the various displays, and enjoyed several runs round the arena.

ENGLISH ladies are not yet, perhaps, as keenly interested in automobiles as are their sisters across the Channel, but the Exhibition held during the past week has shown conclusively that the subject is one of increasing popularity with the sex. It was only necessary to listen to the talk of the ladies to gather that many of them had more than a little technical knowledge as

"THE PADDOCK" AT THE EXHIBITION, LOOKING RIGHT AND LEFT.
Photos by [Argent Arcier].

to the merits or disadvantages of particular types, while inquiry showed that a good proportion of the sales effected had been to feminine buyers. Indeed, so well alive were some of the firms exhibiting to the possibilities of ladies' patronage, that they employed clever and expert lady-drivers to show their cars in motion in the arena, and a Singer motor-bicycle was constantly ridden by a lady.

AMONG the many interested spectators at the Show was the Earl of Shrewsbury and Talbot, who was daily seen in company with his many friends pointing out the various makes of cars to them and making quite a number of converts to automobilism.

ONE of the items of interest on the last day was the arrival of Mr. House and party on the new "Lifu" light steam car. The vehicle came in quite dusty after a long journey up from Poole, the successful trip being the more noteworthy inasmuch as it was the car's first appearance on the road.

AMONG the many visitors to the Show on Saturday last were Mr. Frank H. Butler and his daughter, Miss Vera Butler, both looking well on their return from an automobile tour through the Alps on a 5 h.p. Renault voiturette. They drove to the Exhibition on the same little car, which, with its novel hood, came in for a large amount of attention.

LIVERPOOL CITY COUNCIL was represented at the Hall last week by a deputation consisting of the chairman of the Health Committee and the City Engineer.

THE wealthy people who have been accustomed to go to a carriage builder's and select a brougham or other vehicle for delivery within a week cannot understand why they should be told they may have to wait three months for an automobile. It is, however, a situation that will have to be composedly regarded by many a coming motorist during the next few years. The demand has come along with all the strength of a boom, and agents have not prepared for such a rush. Manufacturers, too, are only just beginning to realise the position of affairs, and while their selling agents can dispose of scores of cars they can only turn out twos and threes. Hence the delay that will arise before many orders lately given can be executed. During the Exhibition many purchasers of voiturettes were heard complaining that they could not get the particular cars they fancied before the end of June—a delay that seems long and dreary when it separates a man of money from pleasures that he thought were immediately obtainable for prompt cash. No, not even ready money can always secure a motor-car, and King Midas must sometimes wait for the gratification of his desires!

AFTER the Show, Mr. H. W. Duret rode his "Singer" motor bicycle down to Coventry. The speed was up to the legal limit all the way, and the only attention the little machine received was a fresh supply of petrol and lubricating oil at half-distance. This is the fourth time that Mr. Duret has ridden between London and Coventry.

THE visitors to the Exhibition represented practically all the professions. The law was represented by Mr. Roger Wallace, K.C., and Mr. Astbury, K.C., the latter being the gentleman who represented the Daimler Company in their action against the British Motor Traction Company.

BRISK business was done at the Show, and the number of new cars on order must be very considerable; while there were many, no doubt, among the visitors who will ultimately become purchasers after further consideration. Those manufacturers and agents who had cars to offer for immediate delivery were in some cases able to command premiums. We heard of one car that was sold about 7 p.m. on Saturday and was on its way to its owner's estate in the country at 9 p.m. the same evening. The Star Motor Company also made what may be termed a record, selling a car within ten minutes of the close of the Exhibition.

MANY of those whose duties kept them in proximity to the arena will no doubt be able to amuse their friends with droll stories for a long time to come. The conversation of those who had tasted of the joys of the automobile for the first time being of a totally different character to those who are, as it were, steeped in petrol and petrol talk. Some amusement was caused by the query of one gentleman, who, after enjoying a run on a Locomobile, somewhat surprised the driver by asking, "What sort of steam do you use?" We believe—although we cannot vouch for it—the answer was to the effect that the steam used was the same as that found in kettles!

THERE were times when so much French was heard in the Exhibition, that one might imagine they were at the Grand Palais, in Paris, instead of the Agricultural Hall, Islington. The French motor world was altogether well represented, the visitors including Madame Lockert, M. Turgan, M. Crouan (whose big car, by the way, came up by road from Newhaven), M. Augé, and M. Serpollet. The latter arrived towards the end of the

week and was delighted to be able to drive his racing steam car round the arena.

MR. LETTS, of the Locomobile Company of America, writes us that during the Exhibition they had a two-seated and a single-seated carriage running in the arena. During the week they gave trial runs to over 7,000 people, and Ginder, on his two-seated car, travelled no less than 374 miles around the arena in the six days, the distance being registered on a cyclometer.

WE have received the following with the request that we should publish it in the *Journal*, which we have pleasure in doing:—

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With the close of the Exhibition to-day, we, the undersigned exhibitors and attendants, desire to express through the medium of your *Journal* our appreciation of the able manner in which Mr. B. H. Joy and his assistants, Messrs. Martin and Braddock, have carried out their duties in connection with the arena. Thanks to their untiring energy, we have been able to demonstrate our carriages with very little delay, while by their invariable courtesy our work in both arena and "paddock" has been rendered as pleasant as possible.

Yours truly,

A. H. DEAVILLE ALTREE (City and Suburban Electric Carriage Co.).	TURGAN AND FOY.

As we go to press the following letter from Mr. Joy comes to hand:—

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On behalf of myself and my assistants at the Motor-car Show held during last week at Islington, I beg to be allowed through the medium of your columns to thank one and all of the various manufacturers very heartily for their gracious letter which appears above in reference to our services, and to assure them that such an acknowledgment of any small services we may have been able to render them in the course of our duties is a source of very great gratification to us. Our task was rendered not only possible but pleasant by their willing efforts to carry out the instructions which it was our duty to enforce.

Yours faithfully,

BASIL H. JOY.

ONE of the features of the Newport streets during the Monmouth Boroughs Election was Mr. Charles D. Phillips' motor-car which is capable of carrying fourteen people as well as the driver. It was out and did good work in all the wards carrying the voters on polling day.

CONTINENTAL NOTES.

BY "AUTOMAN."

AN amusing story reaches me from an eye-witness in the sunny South, and it explains why a certain three-wheeled horseless vehicle did not take part in the Nice Races. There were other brakes besides those of which Mr. Mark Mayhew speaks, which were not powerful enough for the work. In the case of the three-wheeler, the brakes were suffering from a very bad attack of slip. The machine was coming round a bad corner meeting an unexpected tram, and an open carriage with one occupant; there was no room to pass on either side, the pace was considerable, and the brakes refused to respond. Then came an undecided wobble, "Shall I go right or left," and then a heroic plunge in between the victoria and the tram. The space was too narrow even for a three-wheeler, and there was nothing for it but to shut your eyes and wait your luck. How it all happened my informant does not quite know, but in less time than it takes me to write it the automobilist was seated comfortably in the carriage, whose late occupant was twisted up over the remains of the motor, and strange to relate there were two three-wheel machines left, only one of them being horseless.

THERE is to be another Antwerp kilometre competition in the autumn, but this time the paved roads of Vieux Dieu will be abandoned for the smoother macadam of Heyst-op-den-Berg. I do not understand much Dutch or Flemish, but this name certainly sounds like "Haste-up-the-hill."

KING LEOPOLD'S love of the motor-car is not confined to the good roads of the Littoral. Bad as are the Belgian "paves," the royal car takes the King and Princess Clementine almost daily from the Palace of Laeken. Prince Albert, on the other hand, whilst waiting for his new car, which will not be delivered before the 1st of June, is busy perfecting himself in the use of his motor-tricycle.

THE Royal society, "Union Auto-Vélocé" of Belgium, under whose flag the Brussels Automobile Show is held, have decided to go one better and to organise for 1902 a much larger exhibition. They have also decided to hold a Whitsuntide tour, the route being through Libramont, Virton, the ruins of the Abbey of Orval, Florenville, Lacuisine, the castle of Bouillon, Paliseul, Libramont and back to Brussels.

THE latest idea from Paris is to furnish the police with very fast motor-cars with which to give chase to the delinquent who refuses to stop when called on to do so. The idea is comic indeed. Bobby on a bike was bad enough, but Mr. Peeler in goggles and a fur coat chasing a scorcher through the Bois de Boulogne and catching him up at the Porte de Suresnes, where he has to stop to get his petrol sheet initialled by the Octroi, is beyond description. On the question of scorching the A.C.F. has just decided to make an appeal to its members to moderate their speed, and above all to see that their mechanics drive prudently and at a reasonable speed.

THE dispute over the timing by chronometer of the kilometre race at Antwerp has prompted a Mr. Heirman to construct an automatic chronometer. A thin wire is stretched across the road at the start and also at the finish of the kilometre. The motor-car snaps the first as it passes it, and then by an ingenious mechanism starts the chronometer, which is stopped by the snapping of the second wire, and registers automatically the time occupied by the cars in doing the kilometre. The instrument has been thoroughly tested, and it is to be employed in the speed trials of the A.C.B. at Dieghem, on Sunday next, the 19th inst.

THE Austrian Count Carl Schonborn-Buckeim, who has just married Princess Theresa Dentici in Rome, went for his honeymoon in a 14 h.p. Benz, and amongst other feats climbed Vesuvius with his bride. The car took an hour and a-half to

reach the summit, over a bad road, and arrived safely, much to the astonishment of the Cook's tourist parties who had gone up by the funicular railway.

THE *Auto-Velo* is about to offer a Challenge Cup for light carriages, to be competed for annually. Each firm that wishes to compete must enter at least three cars, and the Cup will be awarded to the firm who has the best total average speed for the three cars. To be qualified to compete the cars must have at least two seats side by side, a free motor, and must weigh less than 12½ cwt. The race is to be 124 miles over an ideal racing road, nearly straight, and with only three turns and no villages on the way.

PANHARD AND LEVASSOR are beginning to deliver their 50 h.p. cars, some ten of which will take part in the Paris-Berlin race, driven by the best *chauffeurs* in the world—de Knyff, Charron, Girardot, Chauchard, Pinson, de Perigord, etc. The Baron de Crawhez, of Brussels, will also have one.

SERPOLLET in a 6 h.p. steam car has beaten Corlin on a 12 h.p. petrol car in a thirty-one mile race. Steam won by four minutes.

CHARRON, not satisfied with driving racing cars, has taken to riding racehorses; he made his first appearance last Wednesday week in the Paris-Delatre handicap. He is imitating the riding of Tod Sloan, but he did not score a win.

THE French Government have given their official sanction to the Paris-Bordeaux race, and already several big cars are making trial runs. Levegh and Charron are at work, but are keeping their secrets carefully; Girardot has not got his new car yet.

THE list of entries for the Paris-Bordeaux up to the present are as follows:—Charron representing the French Club, car entered by the German Club, car entered by the English Club, Levegh representing the French Club, car entered by the German Club, car entered by the English Club, Girardot representing the French Club, car entered by the German Club, car entered by the English Club. The above are the competitors for the Gordon Bennett Cup. There are twenty-one other entries which do not compete for the Cup, including six light cars and six motor-cycles. For the Paris-Berlin race there are already thirty-four entries, including Mr. C. Jarrott, Mr. S. F. Edge, and last, but not least, the Hon. C. S. Rolls.

ANOTHER fatal accident, in which a bicycle and an automobile collided, resulting in the instant death of the bicyclist in Paris, last Sunday, leads me to repeat the warning I gave in the *Journal* a few weeks ago to motor-car drivers meeting bicycles. There is no great danger in driving—both the motorist and the cycle rider rely on the powers of quickly swerving, and if by mischance they both happen to swerve in the same direction the result is almost sure to be death to the cyclist. Always slow up and keep well on your own side when you are meeting a cycle.

MICHELIN in his "Monday" in the *Auto-Velo* tells us to always keep pneumatic tires well inflated, if not, the outer covers will wear out quickly near the edges. Don't let the rim get rusty. The rust helps to rot the canvas and the rubber.

IT is quite uncertain yet whether the Mercedes will run in the Gordon Bennett Cup race or not. In the German preparatory trials last Sunday, Tisehbein won, and had a walk over. Scarisbrick on a 40 h.p. Benz threw up the sponge.

THE Justices of Tunbridge Wells last week inflicted a fine upon the driver of a motor-car, not for furious driving, but for failing to stay the speed of his car at the request of a gentleman out with a restive horse.

THE TRANSMISSION GEAR OF A MOTOR CARRIAGE.

A MEETING of the Cycle Engineers' Institute was held at the Exhibition at the Agricultural Hall, on Thursday last week, when Mr. Herbert Austin, of the Wolseley Company, read a paper on "The Transmission Gear of a Motor-Carriage." We have not space to print the whole of the paper, but give an extract therefrom below:—

"The motor itself has been generally considered the most important part of a self-propelled vehicle, but the idea is growing, and not without good reason, especially amongst makers, that the method of transmitting the power from the motor to the driving road wheels is perhaps even more important. This may be partly accounted for by the fact that the motor itself had been brought to a high state of perfection as a fixed engine, whereas the driving gear of motor-cars was, until a year or two ago, very little understood. It would appear to many at first sight, no doubt, a very simple problem to design an efficient means of conveying the power from the motor to the road wheels by utilising one of the many well-known forms employed in ordinary practice, but it is only after a year or two's experience that makers and users begin to appreciate the many drawbacks there are attached to the use of any of the systems at present employed. Each and every system has its good and bad points. It does not at present appear possible to obtain a system which embodies all the good points, and which has none of the bad ones, and one gets bewildered as to what good points to make use of and what bad points to put up with. Perhaps it will be best to give first a brief summary of what I consider the essential features of a perfect system (I use the term in a qualifying sense only) and then examine the various leading systems and see how far they comply with the requirements set forth.

"The following list of conditions must not be considered as arranged arbitrarily in their order of importance, as that is to some extent a matter of personal choice.

"(1) *Efficiency*.—By efficiency, I mean economy in consumption of power; or, in other words, the loss which results in conveying the power from one point to another. It must be obvious to anyone that (unless there is very good reason for it) it is folly cutting down in weight the vital parts of the rest of the carriage to make it light and easy to force along, in order to use an inefficient system of transmission which needs a much larger and heavier motor than would otherwise be the case to overcome the heavy loss which such a system may involve. I have placed this feature first, because everything on a motor-carriage has to be cut down to a very narrow margin of safety, dimensions being largely gathered from experience of what will only just take the strains each part has to stand, any allowance as a factor of safety being practically nil. Therefore, a perfect system should consume the very least amount of power possible in order that as much margin as practicable may be allowed in the strength of all vital parts, and not necessitate a larger motor or the use of more motive power than is really required for the work to be done at the road wheels.

"(2) *Adaptability*.—I mean its use without in any way detracting from or interfering with the other necessary adjuncts of a perfect road carriage. It is only reasonable to suppose that one might be very much disinclined to use what might otherwise be a very good gear, if it interfered very much with the comfort of the passengers or appearance of the car, or necessitated the placing of the motor and other parts in such positions as would prevent their being easily got at for examination and repairs.

"(3) *Simplicity*.—This feature is one which will appeal largely to the non-mechanical users of motor-cars, and even a mechanic's interest in an intricate and complicated piece of mechanism soon wanes when he finds out that each extra part is only so much more trouble, annoyance, and expense. It is an essential feature, which may, however, be easily carried to a point where it becomes a disadvantage, and is more to be considered in combination with other desirable features than possibly any other. Nothing is, for instance, simpler than having just one direct speed on to the driving wheels, but this is only possible with an electric or steam driven car, and is quite out of the question on a carriage driven by any internal combustion motor at present known. Simplicity no doubt means economy in first cost—that is, if it does not require a more expensive motor and adjuncts—and so will always be an important factor in cheap cars.

"(4) *Lightness*.—As pointed out in feature No. 1, lightness is a *sine qua non* of each and every part of a car, so that it must be carefully considered in deciding on what system to adopt. It will, no doubt, be more favoured by those wanting a very light car, than those who would be satisfied with a little more weight, and perhaps less expense and greater durability. To obtain the best results in this direction, aluminium must be used wherever practicable, and as this metal is still dear, and difficult to manipulate, it means some sacrifice on the score of cheapness, and consequently it cannot be adopted on low-priced cars.

"(5) *Durability*.—This is an increasingly important feature of every part of a car. A few years back, when the present automobile movement was in its infancy, no one was much concerned as to how long a car would last, but now that the first flush is over, users are becoming aware of the fact that what may be a cheap car in first cost may be a very dear one before it has run many thousands of miles. It does not follow that to be durable a gear must be very simple, although this is a generally accepted axiom, but its chief hope of a long existence, I think is to be looked for in the action by which the speed change operates

the material of which the various parts are made, and the way in which it is protected from the dirt and dust.

"(6) *Manipulation*.—This feature may be looked at in two ways. It may be considered purely as to the amount of effort or care required to operate the speed changes, or as to the general handiness in relation to repairs in out-of-the-way places, and attention and care in general.

"(7) *Cheapness*.—I have placed this feature last, because I mean by cheapness the first cost; its ultimate cost or cheapness in working coming, I consider, under the heading of durability. Looked at from purely a manufacturer's standpoint this feature would, no doubt, be placed much earlier in the list; and as years go on and competition becomes keener, it will assuredly be an important point, but at present it seems to me that many of the other features should receive preferential consideration, especially from a user's standpoint."

Mr. Austin then described at length the Panhard, Benz, Peugeot, De Dietrich, Renault, De Dion, and Wolseley types of cars, and concluded with a reference to the Hall hydraulic gear. A discussion ensued, in which Messrs. Craig, Boulton, Hall Bramley, and Staner took part. Votes of thanks were accorded to Mr. Austin for his interesting paper, and to Mr. C. Cordingley for the use of the room and for the supply of admission tickets to the Exhibition.

SELF-PROPELLED LORRY FOR MILITARY PURPOSES.

WITH a view to obtaining the best self-propelled lorry for military purposes, the Secretary of State for War offers three prizes—a first prize of £500, a second prize of £250, and a third prize of £100—for the three self-propelled lorries which shall be adjudged, after a series of trials carried out by the War Office Committee on Mechanical Transport, to be best suited to military requirements.

The trials will commence on Wednesday, 4th December, 1901, and will extend over a considerable period, so that the vehicles may be thoroughly tested. The exact nature of the trials will be determined upon by the above Committee. A general scheme will be drawn up and issued as soon as possible to all intending competitors, but the Committee reserve to themselves full powers to carry out any additional tests they may deem necessary, whether included in the general programme or not. The Committee reserve to themselves the power of rejecting any vehicle which does not comply with the requirements published herewith, or of suspending, at any stage, the trials of any vehicle which in their opinion has proved itself unsuitable. The decision of the Committee as to the comparative merits of competing vehicles will be final. Firms or individuals who intend to enter for this competition must send in their names to the Secretary, Mechanical Transport Committee, War Office, Horse Guards, Whitehall, on or before 1st September, 1901.

No vehicle will be admitted to the trials unless a fully dimensioned set of drawings and a specification, giving complete details of the lorry and trailer exactly as submitted for trial, together with a statement of the purchase price of the lorry and trailer, have been lodged with the Secretary, Mechanical Transport Committee, before the 4th December, 1901, the date of the commencement of the trials. A firm or individual may enter more than one lorry, but the conditions must be complied with for each separate lorry entered. His Majesty's Government to have the right of purchasing after the trials any or all of the competing vehicles at the price stated by the competitor.

All designs and specifications lodged will be considered confidential. Those of the vehicles that may be purchased will be retained for the purposes of the Government, but without prejudice to patent rights. Those of vehicles not purchased will be returned to the competitors after the trials. Certain firms have already been asked to send in designs for a lorry for the consideration of the Committee, and some have already communicated with the Committee. It has, however, now been decided to institute an open competition.

STATEMENT OF REQUIREMENTS OF SELF-PROPELLED LORRY FOR MILITARY PURPOSES.

1. The lorry to be capable of being used on rough roads, and to a limited extent across country. To be able to go wherever a country cart can go, and to be capable of being driven through an opening 7 feet 6 inches wide.
2. Nett load to be 5 tons, of which 3 tons must be carried on the lorry itself and 2 tons on a trailer; these weights are exclusive of fuel and water, all of which must be carried on the lorry.
3. Total platform area not to be less than 15 square feet for each ton of nett load.
4. The lorry platform and that of trailer to be fitted with removable sides and ends about 2 feet high.
5. The top of the lorry platform, when the lorry is ready for loading, not to be more than 4 feet 3 inches from the ground level, and that of the trailer not more than 4 feet.
6. The lorry, carrying its full nett load of 3 tons, and drawing a trailer loaded with two tons, to be capable—(1) Of a speed of 8 miles per hour on fairly level roads in fair condition; (2) of a mean speed of at least 5 miles per hour on average roads, up and down hill; (3) of taking its full load without assistance on an average road, up a slope of 1 in 8.
7. The weights should be so distributed that the lorry should always be under control on slopes up to 1 in 8, whether loaded or empty.

8. Proper arrangements to be made that no part of the machinery be liable to damage from mud or dust.

9. Any casings used must be easily removable.

10. In order to avoid damage to the lower portions of the machinery from touching the ground when going over rough country, or in the event of the wheels sinking into soft ground, all such portions must be strongly protected, and, except in the case of the driving gear, must not be less than 18 inches from the ground; the driving gear should be kept as high as possible.

11. The lorry to be capable of efficient control, and steering at all speeds and of reversing at low speeds, and of being worked and controlled by one man.

12. The lorry to be able to run for forty-eight hours without over-haul or cleaning.

13. The driving wheels not to be less than 4 feet 6 inches in diameter, nor less than 9 inches wide across the tires, which may be fitted with plain diagonal road-strips.

14. No restriction is placed on nature of fuel or class of engine, steam, internal combustion or otherwise, except that oils under 75 degrees Fahr. flash point (Abel's close test) must not be employed. In the case of steam engines, an alternative arrangement for burning solid or oil fuel is desirable.

15. In the case of steam engines the construction of the boiler must be such as will comply with the requirements of the Manchester Steam Users' Association.

16. No limit is placed on tare weight, but the total weight will be taken into consideration as stated in para. (c) below.

NOTE.—In considering the merits of the competing vehicles, special importance will be paid to the following points:—(a) Prime cost having due regard to efficiency. (b) Distance that can be travelled by the vehicle when fully loaded with 5 tons, with the fuel and water carried on the lorry (great importance will be given to this point). (c) Economy in weight. (d) Durability. (e) Accessibility of all parts. (f) Simplicity of design. (g) Ease of manipulation. (h) Absence of noise, vibration, and smoke.

FITTING UP A VOITURETTE.

AT Brompton County Court, on Friday last week, before Judge Stonor, Mr. Emil Adam Merkel, managing clerk to a firm of solicitors, and living at Catford, brought an action against the Metropolitan Motor Manufacturing Company, Limited, of Fulham, S.W., the claim being for the return of a motor-voiturette body, two new De Dion engines, four new motor-car tires, etc., said to be wrongfully detained by the defendants, or, in the alternative, the plaintiff claimed £49 as the value of the articles, and £1 as damages in respect of their detention. The defendants counter-claimed for £80 for work and labour done and goods supplied. Mr. E. M. Schiller, counsel, appeared for the plaintiff, and Mr. Vaughan Williams, counsel, for the defendants. Mr. Schiller explained that the plaintiff was connected with a firm of solicitors who numbered amongst their clients the Dunlop Company and several motor-car manufacturing firms. In August last the plaintiff bought from Mr. Underwood, one of the directors of the defendant company, the body of a motor-voiturette, and made arrangements with the Graphic Cycle and Motor Company, Ltd., for putting engines to the body and completing the car, the price estimated for the work being between £35 and £40. Shortly afterwards Mr. A. E. Creese, who had been in business on his own account, but was then manager and engineer to the defendant company, suggested to the plaintiff that his people would do the work at a lower figure. Subsequently Mr. Creese, after he had consulted his directors, arranged to complete the motor-car for £25 or £30. The body of the car was accordingly removed from the Graphic premises to the defendant's shop. In March last the plaintiff got a letter from Mr. Underwood, of the defendant firm, intimating that the car was practically completed; that the battery and coil, which the plaintiff had agreed to supply, were required; that the defendant's account to that time amounted to £80; and that they would be glad to receive a cheque on account. It was subsequently ascertained that the excessive amount of the defendant's charges was due to some friction which there had been between the plaintiff and a Mr. Johnson of the defendant firm. The plaintiff bore out his counsel's opening statement. About a week before the account for £80 was sent in, he (plaintiff) met Mr. Underwood, and said, "You are not going to charge me much more than £25, I suppose?" Mr. Underwood then replied, "I don't think so, but if any more, it will only be a trifle." When he asked for an explanation about the excessive charges, Mr. Underwood and another gentleman connected with the defendant firm, named Jackson, shrugged their shoulders, and pointed to Mr. Johnson, who declined to discuss the matter with him. Mr. Creese stated the price for doing the work, not only when he was in business on his own account, but also after he became manager to the defendant firm, and after—as he said—having consulted his directors. It was not a fact that Mr. Creese merely agreed for his people to do the work "cheaply and reasonably."

Mr. Joseph Farmer, manager of the Graphic Cycle and Motor Works, stated that he heard Mr. Creese say that his people would do the work in question for £25 to £30. Witness also heard Mr. Underwood say that if the price were more than £25 it would be only a trifle more. Mr. Walter Farmer, brother to the last witness, and director of the Graphic Company, corroborated as to Mr. Underwood's remark about the defendant's charges being only a trifle over £25, if over at all.

For the defence, Mr. A. E. Creese stated that he was now works manager to the defendants, and engineer, but was formerly in business for himself in Clerkenwell. When the question arose, he said, about the cost of finishing Mr. Merkel's car, he gave an estimate as to the cost of labour only, because it was first proposed that Mr. Merkel should supply all the materials. Moreover, the proposal at first was that the car should have one engine only, and be driven by a belt, whereas it was now fitted with two engines and made to be driven by a chain. When talking about the price, after he had become connected with the defendant firm, witness did not say anything about the cost being £25 or £30; what he said was, "We shall only charge for cost of materials and labour." As a matter of fact, he, in his capacity of manager to the defendant company, had nothing whatever to do with the cost of materials.

The Judge: In your own business, I suppose, you would have to give the price of materials as well as labour? The Witness: Yes, I used to do so, and I always lost over it. In answer to further questions, Mr. Creese said that on behalf of the defendant company he did not give estimates. The car in question was different from the type of cars made by the defendant company, necessitating different drawings and castings, and it would have been impossible to estimate its cost.

The Judge: My present impression is that the agreement was in regard to the labour, and that the price which may have been mentioned was not intended to include materials. It appears that what materials the plaintiff supplied were used by the defendants on the car, and what materials the defendants supplied were, I think, to be charged at cost price. I think that £45 would be a fair price for the plaintiff to pay. Mr. Schiller said that if his Honour took such a view of the case, he would submit that as the contract was over £10, and there had been no proper agreement accepting the contract, the plaintiff was entitled to offer to pay for the actual work done, and demand his goods back. He maintained that his client was entitled to the body of the car and the materials which he had supplied, and on behalf of his client he would consent to the payment of £30 for the labour. The Judge: But then there is the labour which the defendants have expended upon your materials. They have done the work and are entitled to be paid for it.

Mr. Schiller: But we have reason to believe that the car, when finished, will not go. Ultimately his Honour decided that the case should stand over for a fortnight, and if it was found that the car had been properly made, the defendants would be entitled to a verdict for £45, on their delivering the car to the plaintiff. If there was no appeal by the plaintiff, the defendants would have no costs.

FURIOUS DRIVING CASES.

AT Lewes Petty Sessions Frederick H. Hadfield, of London, was summoned for driving a motor-car furiously at Falmer. P.C. Potter said that on the 27th of last month he saw defendant go past Housedean Park, Falmer, in the direction of Lewes, at a terrific pace, he should say between twenty-five and thirty miles an hour. Witness at once stepped into the road, held up his hand, and, as the car rushed past, called out for the defendant to stop. Defendant stopped the motor-car some fifty yards further on. Witness went back, and defendant said he was going from Newhaven to London, and had been misdirected at Lewes. He added that "perhaps he was going a bit fast, but he wanted to make up for the time he had lost." He took out his purse and offered witness a sovereign. Defendant also said he was off to America in two days, and the police would not be able to find him. Defendant was sworn, and stated that he was going, at the outside, at fourteen miles an hour. As the machine was, it could not go beyond that speed. He did not offer the constable a bribe; it was the custom in South Africa, from whence he came, for the police to accept bail. He thought it necessary to offer the constable bail. He considered that the speed should be checked properly. The constable admitted knowing nothing about motor-cars. Defendant was fined £1, including costs.

AT the Chelmsford County Sessions, Auguste Teschard was summoned for driving a motor-car at a greater speed than twelve miles an hour at Ingatstone and other places. It was stated that the defendant travelled at nineteen miles an hour. The defendant, a Frenchman, through an interpreter, pleaded guilty to going at the speed mentioned, but said he did not know the English law as to the speed he could travel. He had that morning come over from Belgium to Harwich, and was on his way to London. A fine of 10s. and 19s. costs was imposed, and the defendant was informed that the last motor-car driver convicted at Chelmsford of a similar offence was fined £5, and that the Bench dealt leniently this time because of the defendant being a stranger and ignorant of the law.

AT Grimston Petty Sessions, before Mr. S. A. Gurney (chairman), Mr. R. C. F. Everard, and Captain Digby, R.N., Frank Morris, motor-car and cycle agent, King's Lynn, was charged by Police-constable Nichols with having driven a motor-car at greater speed than twelve miles an hour, at West Winch, on April 9th. Dr. Henry Calthrop Allinson deposed that he was driving to West Winch and met defendant coming so fast that he could not recognise him. Witness was in great danger, as his horse was shying. The car was going from twenty to twenty-five miles an hour, to the best of his belief. Cross-examined by defendant, witness said he had no animosity against motor-cars. Arthur Pollocks, groom to Dr. Allinson, said he was with him on the 9th April. He saw defendant on a motor-car, but could not say at what rate he was going. It was a dangerous rate. Cross-examined by

defendant: He had had no experience of motor-cars. If he saw one going ten miles an hour he should be able to judge the pace. Several other witnesses having given similar evidence Mr. Morris addressed the Bench at some length. He said he was endeavouring to carry on a legitimate business against which there was a deal of prejudice and opposition. He contended that he was not going at more than twelve miles an hour, having left Downham at twelve o'clock and arrived at Lynn at one. Sidney Eyre, Duke's Head, Lynn, deposed that on April 9th he left Downham with defendant at, he thought, about twelve o'clock, and got to Lynn soon after one o'clock. When they got to West Winch he saw Dr. Allinson. Witness could hardly judge the pace the car was going, but he did not think it was more than twelve miles an hour. J. H. Richards, Castle Hotel, Downham, deposed that defendant was at Downham on the 9th ult., and to the best of his knowledge he left his house at 12.5. The magistrates retired to confer, and on returning into court the Chairman said the Bench had come to the conclusion that the case was proved against the defendant. The Magistrates imposed a fine of £2 and costs £1 7s. 6d., £3 7s. 6d. in all. There was a further charge of the same kind by Inspector Bayfield against defendant for having driven at more than twelve miles an hour, at Castle Rising, on April 21st. Police-constable Fuller deposed that he was stationed at Castle Rising. On the 21st ult. he saw defendant coming from Babingley at 12.15. He was driving a motor-car at a terrific pace—more than twelve miles an hour. Thomas Harper, labourer, and Edward Porter, moulder, both of King's Lynn, gave evidence, and estimated the pace at from sixteen to twenty miles an hour. Arthur Alexander, a motor-car engineer, deposed that he was with defendant. The car was going from ten to twelve miles an hour. They followed a motor-tricycle, which they first saw at Babingley Bridge. He was sure the car was not going more than twelve miles an hour. They knew by the revolutions. Albert Vere, King's Lynn, deposed that he had experience in motor tricycles. He was travelling on the 21st ult. on a tricycle at about ten miles an hour, with a friend on a bicycle by his side. The car followed them to Castle Rising. The Bench retired, and on return the Chairman said there was a doubt, and the case would be dismissed, but defendant must be more careful. Defendant made application for costs in this case, but no order was made. The defendant then apologised for anything personal he might have said. The Chairman: I am glad to hear you say that.

THE DAIMLER MOTOR COMPANY, LIMITED, v. THE BRITISH MOTOR TRACTION COMPANY, LIMITED.

THE hearing of this action was concluded, before Mr. Justice Buckley, in the Chancery Division on Monday. The action was one by which the plaintiffs sought to restrain the defendant company from registering a new company which they proposed to form under the name of the Daimler Wagon Company, Limited. In delivering judgment, Mr. Justice Buckley said that to call a car a "Daimler" only meant that it had got a Daimler motor. The advertisements showed that people discriminated between a Daimler made by one firm and a Daimler made by someone else. Had such circumstances existed that the use of the name "Daimler Wagon Company" would be calculated to deceive people and make them think they were dealing with the Daimler Motor Company? It was said that people called the plaintiffs "the Daimler Company," and that if a "Daimler Wagon Company" was started his Lordship must infer that there would be deception. In the result he came to the conclusion that what the plaintiffs were trying to do was to get a monopoly of the word "Daimler." The plaintiffs had not made out that the proposed name was calculated to deceive. Whether it would deceive depended on the way in which business was carried on. The action must be dismissed with costs.

It is reported that a Calcutta firm contemplate running motor-cars between Chitpore, Sham Bazaar, and Cossipore to haul wagons loaded with jute.

MESSRS. ASHWORTH, KIRK, AND COMPANY, LTD., timber merchants, London Road, Nottingham, have just received delivery of a Thornycroft steam wagon.

THE American Great Northern Railroad is said to be about to establish a line of automobiles to carry oranges from the packing houses near Los Angeles to the seaports.

THE Daimler Motor Company has supplied three vehicles to a local syndicate which proposes to inaugurate a motor service between Ballina and Enniscroon, County Mayo.

THE Canada Cycle and Motor Company, Ltd., of Toronto, Canada, is building quadricycles and light petrol runabouts. The firm has built a number of motor-quads with mail boxes for the Toronto Post Office Department, which have been given a very severe test this spring, and which are said to have proved entirely satisfactory. Six of these machines are to collect the mail from street boxes and a larger petrol vehicle is to be used to carry the mail between the post office and the railway station.

THE Allgemeine Elektrizitäts-Gesellschaft, of Berlin, is introducing a universal controller for electric motor-cars, which comprises all measuring and switching apparatus, and also the lamp circuits. The apparatus is placed in front of the driver, and fits into a recess of the floor, the cylinder and its gearing being in a box, lying below the floor level. The cylinder can be set at eight positions; either the head light or the side lamps, or all three lamps may be switched on or off. The apparatus are designed for currents of 180 volts maximum, and are made in two sizes, for maximum intensities of thirty and of fifty amperes respectively.

COMPLETE and compact is "The Automoblist's Guide and Motor Tourist's Vade Mecum," compiled by Mr. Robert E. Phillips, F.R.S.S., and published by Messrs. F. King and Co., of St. Martin's Lane, at 3s. 6d. The careful compiler, who claims the honour of producing the first guide to automobilists published in this country, in a short preface pays a just tribute to the assistance rendered in such an arduous undertaking to all who have assisted him, and notably to Mr. Claude Johnson, the Secretary of the Automobile Club. As to the guide itself, it is of the pocket order, neatly bound in a stiff yellow cover, and contains all the information required by the motoring tourist concerning any part of the British Isles. The system of dispensing this information is brief and simple. Towns and villages are arranged in alphabetical order, the early closing day is stated, and a sign denotes telephonic service, and figures in brackets the distance from London. Figures one to six denote respectively, hotels, dealers in petrol spirit, repairers, electric charging stations, storage of cars, and distances to other towns. Capital letters and signs against the various names which appear imply still more. Thus T against an hotel indicates that the Cyclists' Tourist Club tariff is there in force. In similar wise is the nature of the petrol to be obtained at different dépôts made clear, as well as the capacity for charging small or large accumulators at repairers or electric supply stations.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, MAY 25, 1901.

[No. 116.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AN important meeting of those interested in the motor-car industry was held at the Automobile Club on Tuesday, when the matter of supporting only one Exhibition was discussed at some length. There were but two resolutions brought forward, one to the effect that there should be only one Exhibition, and the other, that the one Exhibition should be held under the auspices of the Automobile Club; that the management should continue in the hands of Mr. Charles Cordingley; and that it should take place at the Agricultural Hall. These suggestions found favour with the meeting, and it may therefore be taken for granted that the Exhibition of the Automobile Club, with the support of the Automobile Mutual Protection Association, Ltd., will continue to be the recognised annual display of automobiles in this country. The fact that such a resolution was endorsed after twenty-one proxies in its favour were rejected seems conclusive on that point.

No Arena in 1902.

IN the course of the discussion reference was made to the arena, and the dust that was caused by the vehicles constantly running round. It was felt that the arena had served its purpose in creating public interest, and familiarising people with the easy running of cars. Therefore, in accordance with the widely-expressed desire of the trade, it has been decided to abandon that feature in future Exhibitions, a decision which will keep the Hall absolutely clear of dust and so facilitate the cleaning of stands. In this connection it may be mentioned that one or two of those present seemed to favour the Crystal Palace, and referred to the dusty state of the Agricultural Hall. The absence of the arena will, however, settle the dust question, for it has been demonstrated that in ordinary circumstances the Hall is as free from dust, if not more so, than is the Crystal Palace. Its floor is composed of wood blocks, which are less objectionable from this point of view than open boards.

Accessories will follow the Cars.

TOWARDS the close of the meeting Mr. Sturmev made a useful point in urging that at future meetings invitations should be limited to manufacturers, factors, and dealers in cars. It was rightly argued that the makers of accessories would support the Exhibition that had the cars; and if the manufacturers decided on adhering to one Exhibition the makers of accessories would, in their own interest, attend only that Show.

The Position of the Hall.

WITH regard to the Agricultural Hall and its position, the success of the Royal Military Tournament as a fashionable function is sufficient evidence. This, too, was proved during the recent Exhibition, when the row of carriages extended right round Islington Green on several occasions, while a double row of footmen waited at the entrance to the Hall. It is certainly not too distant from the West End, while its easy access from every part of London is another reason in its favour. Altogether, we are convinced no more favourable and convenient centre for a Motor-car Exhibition exists in London.

Dust Again.

ITALY has had its 1,000 mile Trial—from Turin by way of Florence, Rome, Perugia, and Venice to Milan—and about twenty cars went through the ordeal. Summing up the results of the tour, the *Popolo Romano* declares "motor-cars are not adapted for travelling in caravans; during wet weather the mud, and during dry weather the dust, prevents the machines from remaining close together." Apart from the phrasing of his conclusions, we are inclined to agree with the writer that a number of automobiles travelling in company is likely to arouse the dust; but not more so than a procession of other vehicles. During the 1,000-mile Trial in this country the inconvenience of travelling in Indian file was very apparent on dry dusty days, and the travel-stained appearance of many who took part in that event when they arrived at the end of the day's journey was owing to the vehicles running within easy distance of each other.

Curious Happenings.

WE have yet another reminder of the 1,000-mile Trial in some of the experiences of exhibitors at the Motor-Car Exhibition. Those who participated in the great event of 1900 will remember that tools went astray during the night, that water found its way into petrol tanks, that grease floated in the water of boilers, and that little mishaps occurred in the most mysterious fashion. Curiously enough these vexatious occurrences were repeated at the Agricultural Hall during the early days of the present month. Precautions were taken which appeared more than adequate to prevent any tampering with exhibits, but although watchmen were on duty in the Hall night and day, tools disappeared, tires were punctured, water trickled into the petrol supplies, and other strange happenings were discovered. Every day incidents of this kind were recorded, and Messrs. Roots and Venables had an interesting diary of annoyances. On Tuesday some unknown person poured lubricating oil into the paraffin oil of their motor; on Wednesday pieces of paper found their way to the oil tank, with the apparent intention of blocking the supply pipe; on Thursday a respite was given; on Friday the Salter spring was taken off the governor and a coil of wire substituted; on Saturday pellets of asbestos were dropped into the oil tank, with the result that

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 160-164, Long Acre, W.C.

the motor was stopped when in the arena owing to one of the pieces jamming the oil feeder. Seeing that other firms had experiences of an equally irritating kind, it would appear that the spirit of Theodore Hook, with his tendency towards practical "jokes," has entered the automobile world. Its fun and reason are about as obscure as much of what is known as the "new humour."

Owners Wanted.

INTENT upon seeing the motors at the Exhibition, three persons left umbrellas in cabs outside the Agricultural Hall, and rushed within after paying their fares. One absent-minded man left his stick in the cab. It must be confessed, however, that similar neglect of property was shown by people leaving the Hall. One motorist left a box of cigars in a cab which he hired outside the Exhibition, and a stick was left in another vehicle engaged at the same place. Possibly other instances of carelessness could be given, but these have been brought to our notice by the Commissioner of Police of the Metropolis. The articles we have mentioned have been deposited at the Lost Property Office at New Scotland Yard, S.W., and the losers are requested to forward particulars of the property, the precise time and date of loss, and the journey taken in the hackney carriage, to the Superintendent of the Department without delay.

A Sad Note.

THOSE who took part in the Exhibition were delighted with the way in which the arena was conducted, and in last week's issue they gave public testimony to the unfailing courtesy and universal popularity of Messrs. Joy, Braddock, and Martin. This week we have to record the sad news of the death of Mr. Braddock. On the last day of the Exhibition he was as

active as ever, and in his accustomed health on the Saturday evening. On the Sunday night he took to his bed, and symptoms of pneumonia set in, which rapidly developed, with the sad result that he died two days later. He was an only son, and we would tender to his sorrowing parents the respectful sympathy of the many friends he made in the last week of his life.

Royalty and Automobilmism.

HER MAJESTY THE QUEEN is evidently as much enamoured of the motor-car as is the King. She has been using her electric victoriette on those errands of sympathy which have endeared her to the nation, and on Saturday visited the West Norfolk and Lynn Hospital, arriving unexpectedly on her car, attended by Sir Dighton Probyn and Miss Knollys. Not being content with being merely a passenger, she drives herself, and her example will undoubtedly do much to popularise motoring as a sport among ladies. We understand that the Queen's car has been going so well and satisfactorily that

she intends to make a present of a similar vehicle to her father, the aged King of Denmark. Thanks to the enthusiastic ardour of the British Royal House in regard to automobilism, motoring will soon become the common pastime of kings and queens and the non-motoring royalty will be quite a *rara avis*.

The Gordon-Bennett Cup Race.

HERE our next issue is published the 1901 Gordon-Bennett Cup race will be an event of the past. No definite information is available as to the English cars which will start, but a selection is to be made in Paris to-day, the 25th inst. When we visited the Napier establishment on Monday work was still being actively carried on on the three cars, which are all painted a bright scarlet. The 30 h.p. Motor Manufacturing Company's car, which Mr. Henri Farman is expected to drive, was, we hear, out for a trial trip last week end, and was expected to reach London from Coventry on Thursday evening. The cars of the Automobile Club of France are painted in blue, and those which are to represent Germany in white. Strangely enough, as little has been allowed to leak out with regard to the French competing cars, but we hear that Girardot has been for a trial spin on his car, on which he covered the 144 miles from Paris to Le Tréport in about two hours and ten minutes, or nearly an hour less than the Rapide train. As we go to press we receive a letter from the Hon. C. S. Rolls, in which he states that he has decided to withdraw from competing in the Gordon-Bennett race. "This decision I have felt compelled, to my great regret, to arrive at, owing to the fact that the car which I was to have driven (a 50 h.p. Napier) has not been completed in sufficient time to allow me to make the necessary or proper tests."

Reduction of a Toll.

TOLLS are a nuisance; and often an expensive one. To go over the bridge between Streteley and Goring motorists have been charged 4s.—a tax that was really an imposition. Casual wayfarers were disposed to pay and grumble; taking care to avoid that road in their future travels. But the toll became monotonous to firms like the Speedwell Electrical Motor-Car Company, of Reading, who had to drive a steam delivery van over the bridge once a week. They decided to do what they could to have this excessive charge reduced, and approached the Commissioners of the bridge on the subject. The complaint was regarded as a reasonable one, and was met in a reasonable way; and an immediate reduction from 1s. to 6d. per wheel per single journey has been made. The Speedwell Company deserves the thanks of automobilists generally. The next step is a further reduction to 3d.; and then—away with it altogether.

"The Old is Better."

"SIMPLICITY and reliability." Of course these are what we want in a car, from an economic point of view, and we found it of absorbing interest to wander round the Show in search of these elusive qualities displayed in the fascinating array of exhibits. But when the perfect electric car comes along, with indestructible accumulators giving 100 ampere-hours per pound, and we sit in it and press a button, knowing the car will do the rest, shall we be content? Or shall we not look back with a half regretful sigh to the shows and tours of the beginning of the century, as the old-time cyclist turns from the dull uniform perfection of a modern cycle exhibition to muse on the interest and variety of those of twenty years back, and on the early evolution of the cycle, with its frequent "sports" and "reversions to type"? No, those who are waiting for the perfect car will find when it arrives that it is not so much worth waiting for after all, useful though it be; the charm will have vanished when the feminine caprices of our present objects of affection have merged in the sober mechanical certainty of the "perfect car."

Automobilism in the Tropics.

AN automobilist who recently went out to Ceylon writes to say that petrol or its equivalents are obtainable there, and that he intends sending for a Benz car that he had been using before his departure. It has hitherto been generally supposed that only heavy-oil cars are suitable for tropical countries; but there seems no reason why light-oil cars should not be employed with a somewhat heavier grade of their usual fuel to suit the average temperature, except that some trouble might be caused by the variation thereof at nightfall. We should expect, however, that the question of cooling arrangements would acquire unwonted importance, and that radiators of the usual style would be found "reversible" in action under a tropical sun. This, by the way, suggests the question whether, under ordinary circumstances, black radiators have any appreciable superiority over bright ones, such as the Clarkson-Capel tinned coils. Their principal cooling efficiency must depend far more on convection than radiation, and it would therefore appear that it is of paramount importance that they should be out of the way of a possible coating of mud, even at the cost of their being a prominent feature in a car.

Municipal Motor- Cars.

WHILE not enamoured of the municipal enterprise that thwarts private endeavour, motorists will gladly recognise the forward policy adopted by the corporations of Burton and Derby in seeking powers to organise motor-car services in their respective towns. Why not? Corporations run buses and lay tram lines. Surely it will be better to utilise motor-cars, which have the advantages of the omnibus and of the tramcar combined with all the compensation in the way of economy that should delight the heart of a rate-respecting Councillor. It is significant that the only two applications for parliamentary powers come from the Midlands, where the people are already familiar with auto-mobiles. From thence the popularity of the municipal motor-car should radiate in every direction.

A Steam 'Bus Service in Ireland.

A NEW steam motor-bus, purchased by Messrs. McNeill, Limited, for service between Larne and Garron Tower, Ireland, had a very successful trial trip one day last week. The vehicle weighs some 3 tons 2 cwt. The body is built of oak, with mahogany panelling, and is fitted with glass sides, so arranged that they can be taken out in summer weather. The interior is tastefully finished, the seats are comfortably cushioned, and ample accommodation is provided for twenty passengers. The chassis was supplied by the Lancashire Steam Motor Company, of Leyland; while Stirling's Motor Carriages, Limited, of Glasgow, was responsible for the carriage work. A company of about eighteen assembled for the purpose of taking part in the trial trip. The journey occupied about an hour, and all along the route the vehicle attracted a great deal of attention. Those present expressed themselves highly satisfied with the run, and it is safe to predict that the bus will be greatly appreciated by tourists and others along the Coast Road. We understand that the Belfast and Northern Counties Railway Company have ordered a Thornycroft steam vehicle for use in and about Greenisland.

The Wolverhampton Automobile Club.

ON Saturday last the members of the Wolverhampton Automobile Club went for a run to Stourport, and the return journey was attended with an unfortunate incident. Between Himley and Wolverhampton several of the automobilists pulled up at the side of the road, and whilst they were stationary the mail that is nightly drawn by a pair of horses between Stourbridge and Wolverhampton came along. The driver of it seems to have had some suspicion that motor-cars were not the sort of things that his horses cared for, and he dismounted with the idea of leading them past the row of automobiles. However, the horses took fright, and burst away at the gallop, the

driver losing control. This was about ten o'clock, and the disconsolate driver was taken back to Wolverhampton in a motor-car by Mr. A. Jenks, of Wolverhampton. A short time after this, P.C. Young was standing on duty in Worcester Street, and was not a little surprised to see the mail van coming along without the driver. The constable promptly threw himself at the horses' heads and succeeded in pulling them up, but not before one of the front wheels had passed over his foot. The van was taken to the police station, and the postal authorities, being acquainted with the circumstances, took possession of it and the horses, with the result that the mails were soon despatched safely to the railway station, after an adventurous ride. Mr. Jenks states that the driver was in no way to blame for the running away of his horses.

A Silent Petrol Car.

ON the last day of the recent Exhibition considerable interest was displayed in a new car which made its appearance. Inquiries elicited the fact that the vehicle is one that has been built by Messrs. Wilson and Pilcher, a firm of engineers in Westminster. The other day Mr. Wilson kindly took us for a short spin on the new car, of which we are able to give a few particulars. Much attention has been devoted by the firm to the question of producing a quiet-running car, and they have succeeded, for it is undoubtedly one of the most silent petrol vehicles we have so far ridden on. The power is supplied by a four-cylinder horizontal engine developing 5 h.p. The

[Mr R. W. Buttemer.

cylinders are arranged in pairs opposite to one another, the crank shaft being centrally located. The cylinders are air-cooled, while water-jackets are fitted to the explosion chambers, the circulation being taken care of by a pump and radiator. The engine is well balanced, and is fitted with a governor. Four speeds forward and a reverse motion are controlled by a hand lever at the side. The power is transmitted through a clutch to the variable-speed gear box. The change-speed gear consists of a train of pinions constantly in mesh with corresponding spur wheels on the countershaft. The various pairs of wheels are made to drive the car by means of special friction clutches, and a feature is that, although all the pinions are always in mesh, only the actual pair that are transmitting the power are rotating. From the gear box the countershaft is connected direct to the rear axle through the medium of bevel gearing. The car is fitted with a comfortable body, with plenty of "leg" room; it weighs complete about 18 cwt., and has attained a speed of twenty miles an hour. This is the first experimental car the firm have turned out, but they are so satisfied with the results that the construction of a number of cars on similar lines, but fitted with four-cylinder engines giving 8 h.p., is to be taken in hand at once.

Weight Limit for Racers.

THE Automobile Club of France has decided that the forthcoming Paris to Bordeaux and Paris to Berlin races are to be the last run under conditions which do not limit weight. In all future events the Club will draw up regulations requiring as a qualification that cars, when fully equipped, but without passengers, shall turn the scales at less than 900 kilos. The modern racer, weighing from one to two tons, with 50 or 60 h.p. engines, will, it is probable, shortly be a thing of the past, and manufacturers will be confronted with the problem of developing a high rate of speed without that which has hitherto been considered an essential—weight in proportion. It is just possible that we shall see some startling revolutions in the construction of motor-cars before next year's big races.

The Scottish Automobile Club.

FAVoured with fine weather, the Scottish Automobile Club had a pleasant outing on Saturday last, starting from Edinburgh about 9 a.m. The route was by way of Eskbank, Gorebridge, and Galashiels to Selkirk, and home by Innerleithen and Peebles. At Selkirk the party mustered at the railway station at one o'clock, where their presence attracted a great deal of attention. Forming up in procession, the cars and their occupants proceeded to the residence of Mr. Steele, of Philiphaugh, who had kindly invited the Club to be his guests for the day. In all there were between sixty and seventy guests. After lunch, Mr. Macdonald, Chairman of the Club, proposed the health of Mr. Steele, whom he warmly thanked for his kind invitation, and for his hospitality. Mr. Steele expressed the pleasure it was to him to have them at his place, which he put at their disposal for the rest of the afternoon. Taking their host at his word, the company broke up into small parties and explored the house, which contains many pictorial and other treasures, especially of the carved art of Burmah, a country with which Mr. Steele was long connected. Edinburgh was safely reached by most of the dozen cars about half-past nine o'clock. Nothing sensational occurred on the return journey, except that all seemed to enjoy the splendid run down the hill from the top of the watershed to Innerleithen. The day's run was over ninety-miles, and the character of the country traversed was such as to try the mettle of the cars to the utmost.

The Liverpool Heavy Motor-Vehicle Trials.

THE following additional arrangements have been made in connection with these Trials, which commence on June 3rd. Admission to the Liverpool, Manchester and Blackburn depots will be by card of invitation or by badge. These may be obtained by visitors, on arrival, from the Hon. Secretary's office at the Adelphi Hotel, Liverpool. A limited number of motor-carriages will be provided to follow the runs. Seats (for which early application is necessary) may be booked at 15s. each per day. Tickets, transferable, available for the four days can be had at £3 each; all seats will be numbered. The Third Trials Dinner will be held at the Adelphi Hotel, Liverpool, on Monday, June 3rd, at 7 p.m. The Right Hon. the Earl of Derby will preside.

An Interesting Trip.

LAST year's experimental motor-car excursions met with so much success that the Compagnie Routière de France has decided once again to run an automobile thrice weekly from Paris to Fontainebleau and back, Mondays, Wednesdays, and Fridays. The car selected for this service, which, by the way, commenced this week, is a 15 h.p. Panhard, seating twelve passengers. Leaving Paris at half-past eight in the morning, Fontainebleau is reached at noon. Leaving Fontainebleau at half-past three, the starting point is reached at 6.30 p.m. The outward run is some sixty kilomètres, but the

homeward, which takes in the famous Fontainebleau Forest, is considerably longer. We should like to see this excellent example followed on our side of the Channel, and London as pleasantly linked with some of the historic objects and magnificent scenery which surround it.

THE AUTOMOBILE CLUB'S RUN TO GUILDFORD.

BY no means a bad muster of members attended the Automobile Club's run to Guildford last Saturday, although the pleasingly persistent fine weather of the whole week has made the Club run less of an opportunity than would have been the case if the day had been an isolated one where sunny skies were concerned.

There foregathered at Whitehall Court, Mr. Kenyon and lady, with Mr. C. Harrington Moore, in a 6 h.p. Darracq; Mr. Worby Beaumont, Mr. R. E. Phillips and Mr. W. D. Astell, on the 7 h.p. New Orleans of the last named; Mr. E. de Wilton on a 3 h.p. Ariel tricycle; Mr. J. Duff Gordon on a Mors Petit Duc; Mr. G. D. Barnes and sons on a small Peugeot; Mr. Claude Johnson, Mr. C. Cordingley and Mr. C. L. Freeston, on a 6 h.p. Darracq; and a Petromobile steamer. Other cars which found their way to Guildford were a 6 h.p. New Orleans driven by Mr. Orchardson, a 5 h.p. Bardon, driven by Mr. Baines, Mr. W. J. Peall and party on a 6 h.p. Daimler, and Mr. S. H. Pearce on an 8 h.p. Napier.

The cars, which left Whitehall at a quarter to three, did not all take the same route to Guildford, and, speaking for ourselves, we turned off at the south end of Putney Bridge, and made for Sheen House in order to obtain a supply of motor spirit, which, through the kindness of the Anglo-American Oil Company, was found to be on tap gratis. The drive through Richmond Park, after Sheen House was left behind, was most enjoyable, the trees just now boasting their greenest and freshest hues. While on the eastern fringe of the Park an approaching pair of spanking horses drawing a waggnette showed signs of friskiness, and our car was pulled up short. As the horses passed us we noticed that the whip was Mr. C. Arthur Pearson, who duly acknowledged the compliment.

On the rise to Esher village we overtook Mr. Kenyon's Darracq, stranded for the nonce by a broken sparking-plug. Later on, we met three stage-coaches in succession, and pulled up for each in turn, but only one of the three drivers had the grace to nod his thanks. As our car was running well on the level, but "bucking" somewhat on the hills, we turned into the White Lion yard at Cobham to examine the tremblers. Here we found the Hon. C. S. Rolls on his 24 h.p. Mors, with Mr. Staplee Firth, and Mr. Mark Mayhew and lady, on his 20 h.p. Panhard, who had all driven across from Iver, where Mr. Mayhew had been made a victim that morning at the altar of magisterial prejudice. It is noteworthy to record that one of the gentlemen on the bench did not agree with his colleagues, and that he was a lawyer! As the charge was one of driving to the danger of the public, and not the slightest attempt was made to show that any member of the public was endangered, the magistrates were clearly allowing themselves to be influenced by automobile hatred, and in their saner moments may regret that they did not heed the counsel of the one member of the bench who understood the merits of the case.

While we were waiting at the White Lion, Mr. and Mrs. Weguelin and party came past on a 12 h. p. Panhard. Shortly afterwards we took the road again, and found the drive along the picturesque road to Ripley very enjoyable. There was rather more dust than was pleasant, but the atmospheric conditions were perfect, and nature in her most attractive guise. At six o'clock we reached Guildford, gay with bunting in celebration of the local Volunteers' return, and drove into the yard of the Angel Hotel, where several other cars were already stabled.

A party of thirteen sat down to dinner, and of "petrol talk" there was, of course, no lack. The return journey was begun soon after eight o'clock, and, so far as we have heard, was characterised by no untoward incident.

A RUN ACROSS FRANCE ON A RACER.

By A. R. SENNETT.

AS the International contest is at hand in which we shall see pitted against each other hurriedly prepared racing carriages of British manufacture—the result of but three or four years of emancipation from legal lock-up—and “racers” the evolution of numerous ancestors dating long back, it may be of interest to mention a “run over the course” made by the Hon. C. S. Rolls and myself recently. For some years now I have paid periodic visits to the Continent, from the time one searched it for exhibits for our first exhibition, and it is pleasing to watch not only the material improvement being made in road travel without horses, but also the immense increase of popularity it every year attains. And this applies to every form of motor-propelled vehicles be it steam, electric, or petrol. For example, in this case, a thoroughly successful and very high speed run of several days’ duration upon a “Mors” racer of 24 h.p., during which the engines, although they had never been in use before, gave but very little trouble, one cannot but be impressed with the fact that material progress has been made in internal combustion

ravines through Châteaufort, to Limours. After this—if we are careful to bear to the right at the bifurcation 1·7 kilometres beyond—it is all plain sailing.

Having started not long before dusk we put up at this latter “place,” which seems to consist of two wayside inns, and having just put the car in the *remise*, an operation which occupied exactly three hours and added shades of darkness to the brow—and other parts—of “our” *chauffeur*—by which we mean one truly representative of Great Britain—which industrious mechanic our hostess referred to as *ton fils*, we supped off our dinner, having previously laved off a petro-oleaginous amalgam beneath an apparatus styled a *lavabos* consisting of a tin reservoir like a Benz carburettor slung upon the wall outside the Hotel de la Gare, and from the bottom of which issues a refreshing jet of truly microscopic proportions.

Leaving Limours and passing through Bonnelles, Rochefort, St. Arnault, and Ablis, there is nothing to prevent us keeping on “full steam ahead” until the picturesque towers of the venerable cathedral of Chartres loom up in the distance. We descend sharply into this old town, cross one side of it and ascend upon the other, during which racers will be within the “control.”

[Argent Archer.]

motors and in their carburettors, their ignitions, and other details and paraphernalia attributant to them.

The race is to commence at a point—in our opinion an ill-chosen one—shortly beyond the level crossing and bridge which we pass over and under respectively about half way to Versailles. We think it ill chosen, for a check is almost immediately experienced at Versailles, out of which town of fountain fame and decayed regal splendour it is by no means easy to find one's way if we have not previously paid a visit there to make a note of the turnings, viz., on arriving at the end of the avenue leading up to the château, keep sharp round to the left—hugging the barracks—into the next avenue and leaving the latter by the turning going off to the right, down which road the electric tramway goes, and turning to the right again in passing under the railway arch at about which point drivers will probably find themselves using “bad French” *à cause du paré incroyable*. This is the point at which, in our opinion, for several reasons it would have been preferable to have placed the starting flag. Even from here it is by no means simple way-finding, to the stranger, for the first 25 or 30 kilometres, viz., passing through Buc, Toussus—where we must keep to the left—St. Remy, and the pretty little village of Les Molières, traversing one or two woody

Again *en voyage* we begin to appreciate the long straight stretches of the French roads and are led by them at high speed passing the villages of Thivars, Vitray, and Bonneval to the town of Châteaudun, thence through the villages of Cloyes and Pezou we run into the town of Vendôme. Through this town also, which is not an easy one to get out of, racers will probably be “controlled” and continue on their course. As for ourselves, however, having left Limours about nine o'clock a.m., and finding ourselves here just before noon, we took this opportunity of lunching comfortably at the Hôtel du Commerce.

We should imagine that in no part of Europe, except upon the plains of Lombardy and Piedmont, is such a perfectly straight and level road to be found as that we enter upon immediately after leaving Vendôme. This beautiful rectilinear and approximately flat highway remains staunch to the interests of the high-speed motorist until it descends into the interesting old town of Tours. Mounting again by a zigzag to the right after crossing the Loire, on leaving that town it continues its rectilinear course, but in a lesser degree, through the populous town of Chatellerault and thence on to the historic and high perched Poitiers. From Poitiers to Paris, about 330 kilometres, is a very pleasant day's run for a

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

high-speed carriage and one which we enjoyed immensely on our return journey. Leaving the scene of the historic battle at noon and allowing ourselves an hour for luncheon, we arrived in Paris about six in the evening.

Going to Bordeaux, however, we passed on through Poitiers, putting up for the night at the townlet of Ruffec. Here we "patronised" the hostelry bearing the somewhat grandiose title of "Les Ambassadeurs." We were at first puzzled to know why mine host—one M. Poste—should display upon his signboard his own name in lettering of imposing stature to the almost total occultation of the pronomen of his inn, for "Les Ambassadeurs" are allowed but a meagre measure of importance. The riddle was solved, however, on glancing across the road, when we discovered that the hotel favoured alike by cyclists and automobilists was the "Hôtel de la Poste." *Voilà tout !*

From Poitiers the route continues fairly straight, and but gently undulating all the way down to Mansle, from where we may date the "switch-back" portion of the track; from thence also we find it losing its characteristic straightness, whilst from Chevancaux—in passing through which, by the way, we must be very careful not to miss the quite narrow and easily overlooked turning diverging from the High Street, and for which we must look out on our left hand to lead us to Guitres. From this divergence the route becomes entirely changed in character, for it is now sinuous and—as our *chauffeur* remarked—"not a bit like a racing road." This type of road continues much the same through Guitres, a village, and Libourne, a town of some size—until it lands us *sain et sauf*, as we trust it may all the competitors in the "International" at the "Quatres Pavilions," the winning post, where will be found in waiting upon *les braves chauffeurs* a handsome *brunette* who, with an agreeable "*mélange* of pleasantry and dignity," informed us the cause of her coal black eyes and jet black hair was owing to her being a *Bordelaise*. From thence, having filled up our tanks at the cheapest rate on the road, we descend into a town of southern aspect and southern manners—our destination Bordeaux.

Slacking up in earnest, perhaps for the first time, as the grille of the Bordelaise Octroi loomed up before us in a long avenue and a blinding rain, each doubtless inwardly—but of course not outwardly—exhaling *un soupir de soulagement* that *le mauvais état des routes* had allowed us to complete our trip in peace instead of pieces, we cross the oft-quoted Gironde by a many-arched bridge and deliver up ourselves body and soul to finding the cock of the walk, or, as our French friends say, *le coq du village* of automobilists *l'Hôtel du Chapon Fin*. Here we give ourselves up to good fare and dissertation on a glorious run.

Fine though the *voie* is it is like the *voie* of life, full of surprises. These consist principally of those *bêtes-noires* of the *chauffeur* the *caniveaux*. Scarcely less dangerous, perhaps, brusque *coudes* suddenly making their appearance at the end of long straight stretches and which disclose, no sooner are their right-angled coigns negotiated, the grille of a level crossing. These grilles by their construction may even be a source of danger on straight stretches, from the fact that they frequently consist of thin vertical rods only discernible at a very moderate distance. There are one or two cases in which such grilles present themselves to the surprised driver, in descending a rapid pitch, not many carriage lengths after rounding the bend. An example of such a surprise—a veritable death-trap—is to be found a few kilomètres—perhaps eight or nine—on the Paris side of Barbezieux. There, in returning from Bordeaux and breasting a gentle rise at high speed, we instantly and without any warning came upon an exceedingly rapid descent near the beginning of which is an acute turn, less than a right angle, the bend of which is hidden from view, and were it not we doubt if any *chauffeur* could round the point at full speed without coming to grief over the steep embankment which forms his near side. Forewarned is forearmed, and we should endeavour to locate it by an old tower which stands to the right of the road as we ascend the hill leading to this queer eccentricity on the part of the *ingénieurs des ponts et chaussées*.

French roads are well marked by kilomètre posts, even to the hectomètres. Many, however, are badly kept and present that French error of being inscribed in figures far too small to

be conveniently useful. The smallness of the lettering upon direction posts and tablets, and the use of iron for these—as inapposite, as it is universal on the Continent—becomes annoyingly *en évidence* to the automobilist. One very disappointing feature of the kilomètre posts is that they do not always show the distance from Paris, but instead merely give their position in relation to the boundary of the particular Department in which they may be situated—a point of but little interest or value to the automobile tourist.

With regard to the trouble arising from rust upon the direction posts and notices, it is to be hoped that that much over-rated metal aluminium may have something to say; whilst in regard to lettering it may be mentioned that there are five principle kinds of roads. The most important, and that over which the race will be run during its entire length, being the *Routes Nationales*. These grand highways are kept in the most laudable repair as are also the *Routes Départementales* and the *Chemins de Grandes Communication*. The two remaining, viz.:—the *Chemins d'Interest Communs* and the *Chemins vicinal ordinaires* may vary greatly as to their upkeep, whilst the state of the *Chemins ruraux et particulier* may be anything, but the latter do not affect the motorist. The class of route on which we may be travelling is designated by the colouring of the board itself and its lettering, but this entails material loss of efficiency in them. We find, for example, white lettering on French grey a combination sadly wanting in definition, especially when the canker rust begins to assert itself. This idea of giving a distinctive feature to direction posts whereby one can tell instantly if one has inadvertently left, for example, our direct road upon a *Route Nationale* and wandered upon a *vicinal* way, is, *per se*, a good one, but it would be far better carried out by adhering to the old English custom of bold black-upon-white, with the addition of a coloured border to the board or band upon the post, such border or band signifying the class of road upon which the direction post, as the Frenchmen say, finds itself.

Time doubtless will bring with it improvements of this nature, modifications which will arise as the transition from slow to rapid common road transport proceeds, but it is to be hoped that improvement in regard to the "surprises" of which we have spoken may not long be delayed, more especially as concerns the *caniveaux*, since these could be improved off the face of the roads at small cost, and to immense increase of both comfort and safety in high-speed motor touring. The fact that these drains traverse without warning highways of otherwise almost perfect upkeep is as incongruous as their existence is annoying. For they are to be met with in places where everything else is conducive to high and exhilarating speeds, as, for example, in descending those lovely long and perfectly straight hills when we can look forward to 70 miles per hour as well as a good sound shaking up if such a surprise as a hidden *caniveau* should be met with near the bottom. This actually happened to us; the speed was magnificent, speech was impossible, when nearing the bottom and at that point when our *chauffeur's* "Ha! Ha!" was nearly due we flew over a *caniveau*; we say flew advisedly, for we both suddenly became aeronauts, and a good deal of daylight might have been seen beneath a certain portion of our anatomy, but alas! this airy flight was not to last, we both returned, and this with such a crash as our anatomies had never known, too great, indeed, for the seat, which, being burst in, deposited us safely but abruptly upon *les utiles*, a proceeding *utile, mais punible*. One of our engineer friends complains that a certain type of steam carriage is conducive to burnt anatomies, we can testify that racing cars are provocative of bruised *idems*.

Despite such slight drawbacks as these to which we refer, so inviting are the highways of *La belle France* that your British *chauffeur* leaves them with the greatest reluctance, and frequently, as in our case, he leaves behind him his much beloved automobile, with the resolve that he will be back as soon as possible to indulge in runs such as the British policeman cannot tolerate. With this longing for Continental runs we have very great sympathy; but we certainly have not with the fashion now becoming so prevalent of flavouring the British horseless vehicle industry with French sauce. To our mind it seems as unnecessary as it is unpatriotic to make use of a mongrel language

in regard to a sport which should have all its energies centred on its own growth and physical improvement. To have given to our club of horseless travellers the name of "automobile" was, we consider, at once courteous and diplomatic, although in our opinion the "Motor Coaching Club" would have had a better ring; but to continue a jumble of French and English we consider very undesirable. We confess to something in the nature of a shock on at first hearing that our Automobile Club was to have a *garage*—dreadful word; would not the English word store or the Anglicised *dépôt* have been both simpler and more natural? In places where motor-vehicles were only to be temporarily stored the term "running store" might have proved as intelligible as "running shed" has been for so many years in regard to railway locomotives. We are keenly looking forward to the expression of blank amazement which will overspread the countenance of the first British rustic whom we shall have occasion to greet with, "Where is the *garage*?" It is, indeed, mere affectation for the owner of a horseless vehicle—we beg pardon, a *chauffeur*—to inform one that he is about to construct a *fosse* in his coach-house—pardon *remise*. A "fosse" in common parlance means a ditch; let him put ditches in his coach-house by all means, but why should not the word—clear and terse—"pit" be good enough for a road stoker as it has so long proved itself to be for a locomotive engineer? If this sort of thing goes on we shall have our rural police, and yokels generally, giving their evidence somewhat in this manner:—"I was a zdandun wee Goiles near the 'bout' o' the *collin*—whot's got a 'rump rapid' and a 'coin brusker'—not more nor your meters vrom the *caniveau*, when I zeed the autimobyle rushin' down a blowin' es *tromp*, and I zes to Goiles, I zed, 'that theer *chuffer's* got 'er on 'er *catrionne weelesse*, and as zure as I ai't President Loubay, 'e'll ave a *contray tromp*; the *bon's* a bit *glissont* and if 'e tries *d'freining* 'is *wouture* 'e'll be in the *fosse* zoon as he comes to the *pavey*, another vive minits and that theer auto'll be 'n *punnee derapage*. 'll zettle 'er' I zes, 'so off ye goes for Dr. Zoorbones on yer *biygette*,' I zes, 'and zur 'nough!'"—"Thank you that will do," from his Honour.

On the other hand, that automobilism is synonymous with development and education is undoubtedly a fact, for on the Continent we find men, both well read and nobly born, undergoing courses of technical instruction the better to fit them as both *chauffeurs* and amateur mechanics; whilst contrary to what might at first be thought, automobilism is conducive to a higher standard of physical development. A good *chauffeur* should have conscientiously served his apprenticeship to his automobile, and in this he will find his hands—if he be not afraid to soil them—quite as useful and necessary and as capable of skilful application as they would be in "tooling" a "four-in-hand." Automobile nomenclature requires some study. Your motor is not to be put off with vague ambiguities, one cannot start a recalcitrant one on information received from a reply to such a question as "Now what am I to do? I have tightened the 'thing-me-bob' and loosened the 'thing-a-migig'; I am sure the 'what-is-it' is all right, and I have oiled the jigger on the 'what-you-may-call-em,' but still she won't go."

Certainly, four out of the five senses are not only required in motor driving but are thereby sharpened. Sight, the most indispensable of all, to a high-speed driver—a sense which, in this relation, must be inseparably welded to nerve and decision—is undoubtedly improved in its acuteness. As regards hearing, the working of a four-cylinder internal combustion engine to the man in the street merely makes a "— noise"; to a "stoker" it is rhythmic melody in the varying cadences of which he can at once detect if his ignition, his governing, his exhaust, and his throttlings are as they should be. The sense of touch is perhaps requisitioned as much as any, and this, too, is frequently quickened; your experienced *chauffeur*, for example, can tell instantly on placing his hand into that bag of myriad tricks beneath his *bonnet* if he has touched a leaky electric ignition or an incandescent tube. *Prima facie*, one would hardly expect the sense of smell to be requisitioned, the popular belief being that the motor's legacy in this regard is left *pro bono publico*; this is quite an error, for, sitting in his Promethean-propelled chariot, your *chauffeur* from time to time

makes an olfactory analysis—to the second place of decimals—of the relative percentages of "essence" to "lubricant" merely by the nasal aspiration of a sample of "smell" taken at will—or without it. In regard to this, perhaps, even the fifth sense—taste—plays some part.

Speaking of the development of the senses, may we here beg of our medical practitioners—for whom we are doing a good turn in providing them with an economical and pleasant mode of "doing their rounds"—that they will not turn such inventive talent as they may possess towards the development of a brand new set of diseases for us, and which they will probably brand as "automobile ataxy" (attacks-see). The *chauffeur*, being a man of much resource and small requirements, will willingly contrive to do without them.

We would, however, like to learn from our highly-respected "medicine men" if the intemperate imbibition of "sixty-mile air" is capable of producing intoxication, or possibly vibration-aberration. Like the Scotchman, we are a "wee bit worrit" about certain symptoms we have observed in "our" stoker after very long runs. For example, coming to table after "just feeling round the car"—an operation usually delaying dinner for three hours or so—he would—whether he felt himself to have been the horse we know not—on entering from the "stable" mutter something about the manger—*quelque chose à manger*—whereupon he would at once pounce down upon what he called his *horsey d'overs*. We tried gentle questioning, such as, Which is the best place for auto-clothing? To which, with an abrupt *sforzando*, he would *jeter à la tête*, "Beau-t'ful gardiner's daughter!" perhaps "Great magazine of love!" or "Good ma chère!" Yet there was always method in his mad, aerotoxication; for are not autocarts *en evidence* in Paris bearing the legends *Belle Jardinière*, *Grand Magasin de Louvre*, or *Don Marche*. One thing we can vouch for, this was not due to the *vain du payee*! the libation to Bacchus acting indeed merely as file and sandpaper to the acuteness of "our" *chauffeur's* ardour. Add to this, however, the soporific effect of a stream of super-oxygenated blood sluggishly dragging over his brain a burthen of *débris*, embers of the burning of two or three hundred kilomètres of forced draught, and one need not be surprised to read in "our" stoker's *figure* a desire to dream of prospective courses rather than to converse upon them.

At this stage we would venture to inquire, "When do we leave?" To which—in dulcet tone and *piano*—he would reply, "Lundi, Mardi, Mercredi, Jeudi." Then conversation would flag, and we would venture to ask, "When shall we go to bed?" To which, in *dolce* cadence—*diminuendo* to *pianissimo*—he would murmur, "Lundi, Mardi, Mercredi. Good-night, old chap."

(To be continued.)

THE new Romney Rural Council has decided to make a representation to the Standing Joint Committee of the County, calling attention to the excessive speed at which motor-cars travel, and asking them to instruct their constables to look into the matter.

MR. GEORGE TUFNELL, of 527, Leytonstone Road, Leytonstone, Essex, has been appointed an official repairer to De Dion Bouton, Limited, and to the Motor Manufacturing Company, Ltd. He informs us that he has a large stock of small parts, and has facilities for executing repairs to all kinds of motor-cars. He also stocks petrol, lubricants, etc., and can recharge accumulators.

FROM Messrs. Monk and Lonsdale we have received an intimation to the effect that they are in the habit of supplying petrol on Sunday mornings at their works, 105 and 106, North Road, Brighton. They further intimate that they are shortly moving to larger premises at 41, Waterloo Street, Western Road, where the wants of motorists will be attended to at all times—night, day, or Sundays.

MESSRS. ROSE AND COMPANY, of Castle Road, Southsea, have obtained a licence to stock petrol to the extent of 300 gallons for the use of motorists. That they have ample facility for storage and repairing was recently proved, as on the occasion of the run from London to Portsmouth they dispensed no less than 325 gallons of petrol, and did some repairing in a rapid and satisfactory manner.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE A.C.B. kilomètre speed competition, with a flying start, took place near Dieghem, on Sunday, beginning at two o'clock in the afternoon. The road chosen is of macadam and rather narrow, quite straight; but it seemed to me not exactly level, and as it was covered with very small loose stones, three cornered and sharp looking, the conditions were certainly not of the best either for speed or for the welfare of the tires. The day was dry, but rather chilly and cloudy at intervals, with a great deal of fine dust. There were fifty entries, comprising motor-cycles, voituresses, light and heavy cars, and the competition was divided up into nine classes. About 500 yards was allowed for the flying start. There were nearly 3,000 spectators, and though the road was better cleared than at Antwerp, a serious accident was only just averted by the skilful driving of M. Roland, who was the winner of the record. Just as he was coming by at nearly forty-three miles per hour, an old woman started to cross the road, and would certainly have been killed had not Roland swerved at the risk of going into the ditch. Unfortunately the great event of the day did not come off, as neither the Baron de Crawhez's 28 h.p. Panhard nor the Baron

THE A.C.B. paper-chase took place in the Bois on Thursday, the 16th inst. M. Lucien Hautvast was the hare and started off at 7 a.m., assisted by the Baron de Crawhez. At ten o'clock the hounds, consisting of some twenty motor-cars, started from the Automobile Club, Place Royal, and took up the chase, following a false scent until turned back by the green confetti, which was the indication of the end of the deceiving trail. Mr. Van der Spek, on his 12 h.p. Belgian Daimler, arrived behind time, and seeing the returning cars, avoided the trap and got to the head of the pack; but he was not destined to keep his lead very long, for several fresh false scents completely changed the order of the pack; and finally M. Hubert Portier, member of the A.C. of Holland, in his 12 h.p. Pipe car, found the hare comfortably established under the trees near Everbergh. Count Racinsky, on a 7 h.p. Peugeot, arrived second, and M. d'Aubreby, on a 6 h.p. Belgian Daimler, third. The hare and hounds then proceeded to lunch, and completed a most successful day in a convivial manner.

AN important advance in the quick repairing on the road of motor-tires has been made by M. de Seunevoy, who has discovered that he can save a great deal of time and make a repair which is more permanent by winding round the inner tube a band of thin rubber, which covers the patch and holds it firmly

THE BELGIAN AUTOMOBILE CLUB'S KILOMETRE SPEED COMPETITION. M. WEBER'S "TORPILLE" CAR AND M. DE SMEDT'S DE DION VOITURETTE.

de Caters' 1901 type Mors were ready for the trial, and M. Miesse's 12 h.p. steam car, which, it is said, can do sixty-two miles per hour, did not come up to scratch. The best times were made by Roland, on an 8 h.p. Gobron-Brillié, 42.91 miles per hour; Van der Spek, on a 12 h.p. Belgian Daimler, 40.57 miles per hour; Paul Wilford, on a 16 h.p. Peugeot, 40.57 miles per hour. A 6 h.p. twin-cylinder Deschamps car, driven by M. Dratz, won the competition for cars weighing between 7½ cwt. and 12½ cwt., easily beating a 12 h.p. and a 6 h.p. Vivinus and a 6 h.p. Torpille, driven by the Baron de Crawhez, and doing a speed of 28.63 miles per hour.

THE A.C.B. are organising for July a fête in the Bois de la Cambre which has every appearance of being a brilliant affair. The Bois, situated quite close to Brussels, is a beautiful spot and an ideal rendezvous for outdoor sports of every kind. The fête will be inaugurated with a battle of flowers for motor-cars and bicycles, and there will be fencing, regattas, contests for boats with petrol propulsion, and balloon ascensions and competitions, and also water polo and other nautical sports. Talking of balloons, there seems somehow to be a kind of fraternal tie on the Continent between automobilists and aeronauts, for both the A.C.F. and the A.C.B. are the headquarters of the navigators of the air.

in its place. By the use of this method it is not necessary, says M. de Seunevoy in *La France Automobile*, even to wait until the solution is dry before the patch is put on; the solution can be spread on the tube and on the patch, fix the latter in position, inflate the tire slightly, wind the rubber tape round the whole, and replace the cover, inflate, and off you go. This system will, it is stated, apply not only to small punctures, but also to a hole as big as a franc piece.

THE Italian tour came to an end at Milan on the 11th inst. The start was made in showers of heavy rain and the finish in clouds of dust. The trip has been a difficult one, especially the part between Rimini and Bologna across the Apennines, where on the steep and dangerous hills more than one car was obliged to call in the aid of a team of friendly bullocks to help it on its way. A very sad fatal accident occurred between Bologna and Padua. A Florentine, named Le Chevalier Toniatti, whilst passing a smaller car on his 24 h.p. Panhard had the misfortune to run over a little girl. It seems that the child rushed suddenly across the road in front of the car, carrying a one-year-old baby in her arms. M. Toniatti was not going fast, but the accident was inevitable. The aluminium mud guard struck the little girl on the forehead and death instantly ensued. The baby had a miraculous escape and fell between the mud guard and the bonnet

and was seized by its clothes by a friend of the driver and hoisted safely into the car. This untoward event cast a gloom over an otherwise successful trip, and the distress of Chevalier Touietti at the terrible misfortune of which he was the cause secured him the sympathy of everyone.

ENGLISHMEN travelling to Switzerland in their motor-cars will do well to note that they must take with them a document certifying the name of the maker of the car and also that of the maker of the body, and giving the weight of each separately. I should recommend them to get this written in French on paper with the printed heading of the makers and signed by them, and giving the weight in kilos. They will have to pay about 1s. 1½d. per 100 lbs. on the car and 7s. 3d. per 100 lbs. on the body. If they have not a certificate of this kind it will be necessary to have the car weighed and to pay 7s. 3d. per 100 lbs. on the total weight. The weighing of the car will also very often necessitate delays and cause trouble. The amount paid will be refunded when the cars leave the country at any frontier station.

THERE are altogether eighty-seven entries for the Paris-Bordeaux race, amongst which I notice nine Panhard and Levassors; six Darracqs; five De Dion motor-cycles; four Renaults; three Mors; three De Dietrichs; three Mercedes; two Decauvilles and two Turgan-Foy cars. It is remarkable that there is not a single De Dion voiturette. From the *Auto-Velo* I gather the following curious calculations:—There will be 1,200-horse power on the road, consuming 132 gallons of petrol per hour, and the total value of the cars on the road will be £80,000.

FROM the latest information obtainable at headquarters, I learn that the German Automobile Club will run a Mercedes in the Gordon-Bennett Cup after all, but whether it will be exactly the Nice model or not is as yet quite unknown. It seems to me to be the dark horse in the race.

MICHELIN'S eleventh Monday in the *Auto-Velo* deals with the delivery in France of his tires, and does not interest the English reader; the subject seems to be about exhausted.

A PRIZE of 1,000f. is being offered by Prince Pierre d'Arenberg to the first alcohol motor-car to reach Berlin in the coming Paris-Berlin race.

THE tour of Holland, organised by the Dutch Automobile Club, will commence on June 4th and extend to June 7th. The days' runs range from 115 kilometres to 184 kilometres.

A COMPANY has been registered with a capital of £5,000, to acquire the motor-car agency business carried on by Mr. J. J. Mann, and to carry on the business of manufacturers and proprietors of, and agents for motor-cars, etc., under the name of Mann and Overton, Limited.

THE Worshipful Company of Coach Makers and Harness Makers of London is offering a scholarship of £25 for one year in connection with the Higher Technical day class in road-carriage building at the Polytechnic Carriage Building School, commencing Monday, September 30th next.

SOME forty or fifty motor-cars are expected at the motor meet at Ayscoughfee Hall Grounds on Whit-Monday. The Lincolnshire Automobile Club is a strong body, and includes some of the leading people of the county. The object of the meet is to demonstrate the capabilities of motor-cars and the ease with which they are controlled.

THE endurance test of the Long Island Automobile Club, held on April 20, was a severe one, as the weather was as bad as it could possibly be. Out of 25 entries there were 15 starters, and 10 completed the course. The Gasmobile and Haynes-Apperson vehicles were awarded highest honours, going through without a stop. The Holyoke was next, with one minute stop. The De Dion-Bouton, Darracq, Daimler and Electric Vehicle Company were also near the leaders. The De Dion-Bouton Company and the Electric Vehicle Company won the hill-climbing contest.

CORRESPONDENCE.

BELT TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 9 h.p. Benz car, and the only trouble I have is with the belts, which, as soon as I have got the stretch out of them, break. I have tried both single and double raw hide and tan belts, also canvas and rubber Balata belts, but all to no use. I cannot use a wider belt than 2 inch. I should be glad to have the experience of those who have had the same trouble; also as regards belt fasteners.—Yours truly,

R. E. L.

MOTOR-CARS V. MOTOR-CARRIAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some years I have been looking forward to the time when I could do away with my horses by purchasing a motor-carriage. It seems, however, that the craze is still to bulp motor-cars for speed and long distances. There are thousands like myself who would be prepared to buy a reliable motor-carriage for the ordinary uses of every-day life. The design of most motor-cars is more like a fire engine. What is wanted is a motor-carriage on the lines of the landau, a vehicle elegant to look at and that could be open or closed at the will of the user, so that in sunny weather it could be open and in rainy weather closed. In my case I do not want to go from John o' Groat's to Land's End in so many hours. I merely want to go shopping, drive to the station, or take a drive into the country, as I would do with my horses, at eight to twelve miles an hour. I want my engineer to sit on the box as my coachman sits when driving me in my landau, so that he would be in his proper place and not one of the carriage party. Enthusiasts may prefer to drive themselves, I do not. Now I have outlined what is required I have no objection to you giving my name and address to any firm who think they can supply my requirements.—Yours truly,

MOTOR-LANDAU.

THE CONSUMPTION TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—We notice in your issue of the 11th inst. a remark to the effect that the New Orleans car was the most efficient in the consumption test held on May 2nd. This is incorrect, as the inclosed figures show. Efficiency of the motor cannot possibly be governed by the weight of the passengers carried, as if anyone chooses to have a light frame and stick an egg-box or two on it for seats, he could easily increase its carrying capacity far beyond what would be practicable with a substantially and comfortably built car. It was extremely annoying to us to find, in spite of all our precautions, that the sealed cans of petrol we purchased should have contained water. This led to our having to take off the petrol connections on the first ascent and lose some of the petrol in trying to get rid of the water. In future, care should be taken that observers know the road, as our car was taken some distance out of the proper course on the outward journey, and did, probably, thirty-four miles instead of thirty-one.

Our car, which was one of last year's pattern, kindly lent to us by Mr. Barside, of Halifax, as you will see from the enclosed figures, was the most efficient on the outward journey, and on the three trials was practically equal to the 6 h.p. Daimler, whose journey on the return was made, if the figures are correct, on quite 30 per cent. less petrol than the outward journey. As the speeds of the cars varied so much we think the hill test the best guide, as each car then did its best.—Yours faithfully,

H. AUSTIN.

1. 6 h.p. Daimler.—Trial A, 1'30 gallons per ton; trial B, '879 gallons per ton; trial C, '355 gallons per ton; total—2'534 gallons per ton.
2. 5 h.p. Wolseley.—Trial A, 1'145 gallons per ton; trial B, 1'062 gallons per ton; trial C, '369 gallons per ton; total—2'576 gallons per ton.
3. 24 h.p. Daimler.—Trial A, 1'133 gallons per ton; trial B, '944 gallons per ton; trial C, '555 gallons per ton; total—2'632 gallons per ton.
4. 7 h.p. New Orleans.—Trial A, 1'334 gallons per ton; trial B, 1'133 gallons per ton; trial C, '427 gallons per ton; total—2'894 gallons per ton.

5. Ariel Quad.—Trial A, 1,546 gallons per ton; trial B, 1,146 gallons per ton; trial C, 474 gallons per ton; total—3,166 gallons per ton.
 6. 8½ h.p. Decauville.—Trial A, 2,000 gallons per ton; trial B, 2,026 gallons per ton; trial C, 733 gallons per ton; total—4,759 gallons per ton.
 7. 5 h.p. Decauville.—Trial A, 2,64 gallons per ton; trial B, 2,794 gallons per ton; trial C, 597 gallons per ton; total—6,031 gallons per ton.

RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am obliged to Mr. Edge for his letter in your issue of 11th inst. pointing out error in Mr. Mayhew's notes, which, of course, puts quite a different complexion on the matter. Mr. Edge was also good enough to mention the weight of the new 70 h.p. motors for the Napier cars. It would be interesting if he would supplement this with the weight of transmission gearing, cooler, and battery; also total weight of water and fuel carried, and how far same is estimated to carry the car at top speed.

He also states that he thinks no steam engine and boiler can come anywhere near the result obtained by the Napier motor, and on this point I should like to draw attention to what has already been done in the way of light steam machinery where light weight was of utmost importance. In the year 1894, Sir H. S. Maxim made a steam plant for a flying machine, consisting of a water tube boiler, oil fired, and ordinary two-cylinder compound engine; the weight of boiler was 1,000 lbs., and taking the actual results obtained from it there was steam enough produced to develop 750 h.p. if used in a quadruple expansion engine. Mr. Maxim's two compound engines weighed 644 lbs. for the two, and if designed as one quadruple expansion would certainly not weigh double that, or even near it but; to be well on the safe side, I will say 1,000 lbs. for the engine, which means that the engine and boiler alone weigh 2,000 lbs. for 750 h.p., and this corresponds to the motor, carburettor, battery, and transmission gear of explosion engine, no transmission gear being required for a steam engine, and weight per h.p. as follows:—

Steam engine and boiler 750 h.p. 2,000 lbs., equal to 2.7 lbs. per h.p.; steam engine and boiler 70 h.p. 250 lbs., equal to 3.5 lbs. per h.p.; Napier motor without transmission gear, carburettor, or battery 70 h.p. 700 lbs., equal to 10 lbs. per h.p.

It should also be remembered that with a steam engine direct coupled to driving axle a much larger percentage of the power would be transmitted to the wheels.

In the above comparison I have allowed more weight for the smaller steam engine. A condenser is required in each case and also a certain amount of water, but not having the weights for Napier motors I can make no comparisons, but may say that the weight of water carried by the Maxim boiler was very small.

The above is taken from actual experiments and known facts, and what was done in 1894 can be done better to-day, and I am still of opinion that if the greatest power be required for minimum weight then a steam engine and boiler stands far and away ahead of anything else at the present day, and I only wish some racing man, who has the necessary means and courage, would come forward and have a car got out on the lines I indicated in my last letter, and if speed be his object he would undoubtedly get it. — Yours truly, STEAM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had meant to reply to "Steam's" letter earlier only I could not find time to do so. It is all very well for "Steam" to cry down petrol cars, but can he produce anything better in the way of steam? "Steam" did not observe that the Serpollet car was "left" on the hills, which strikes me as a somewhat important point. As regards weight Mr. S. F. Edge has clearly replied to "Steam," so there is no more to be said on that point. I should recommend "Steam" to go and see over Messrs. Napier's works. If I remember aright "Steam" is the gentleman who, some time back, made some disparaging remarks about the Daimler motor and Panhard gear. I may be mistaken, however—very possibly I am—in which case let "Steam," whoever he is, consider the statement withdrawn.— Yours truly, R. A. COBB.

AN OBSTINATE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the unpleasant circumstances connected with the motor of your correspondent, G. W. Grabham, M.D., I would suggest that he remove the gas valve, test compression of spring, then the condition of valve stem; if he finds the latter to his satisfaction, let him remove one coil of spring; then test motor. If no improvement takes place, remove more; the valve is too heavy for a low velocity.—Yours truly,

H. LAMBERT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Dr. G. W. Grabham's obstinate voiturette, I had a De Dion car which served me in just the same manner, when I first had it, and finding everything in good order I tracked the trouble to the sparking plug, which I took out, bringing the points together till they were just about 1-32in. apart. After replacing the plug I did not have the slightest trouble; the car would take any hill. If G. W. Grabham, M.D., will try this I think he will find his troubles ended; if this does not cure it, I should be pleased to help him.— Yours truly,

C. J. CATHERY.

THE STREATHAM-CLAPHAM JUNCTION SERVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When Streatham first heard it was to have a motor-car service to Clapham Junction, officially stated to run at ten minutes' interval, and at twelve miles an hour, there were thoughts of good things, especially amongst the local business folk. But they were sadly deluded, for while waiting for one they heard that the cars ran at half-hour intervals, were well filled, and that the twelve miles an hour was much appreciated. After waiting 1½ hours, however, they return home, appointments cancelled, to condemn the new locomotion entirely as unreliable. As an advocate of mechanical traction I am sorry to see this sort of thing bring the new type of locomotion into disrepute.— Yours truly, C. H.

PETROL AT BRIGHTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago I read a letter in the *Motor-Car Journal* warning motorists against going into Brighton because petrol was not obtainable there on Sunday. I may say I was there on Sunday last and had no difficulty whatever in obtaining it at Mr. J. Miles', 1, Trafalgar Court, Trafalgar Street. I found his assistant most obliging. He informed me that they always had a good stock of petrol and best lubricating oil and were anxious to do all in their power to oblige motorists going into Brighton. I stored my car at the King and Queen Livery and Bait Stables. It was a good place, and the charge was only 1s. for the night. I hope this information may be useful to some of your readers.—Yours truly, H. SEAL.

MR. S. F. EDGE writes referring to the device for showing the circulation of the water in Mr. Stanton's car, mentioned in our last issue:—"I would like to point out that this arrangement of a tap on the dashboard is embodied in every standard Napier car turned out, and has been, ever since the first one was manufactured. On the larger carriages we make arrangements for this water to run into the water-cooled brake drums, to keep these filled."

THE French Department of Public Assistance has asked the Paris Municipal Council for a transformation of the existing type of city ambulance into the automobile type. The innovation is due to the initiative of Dr. Martin, who has called attention to the very long time frequently required for transporting invalids from their homes to the hospital. Trials have already been made, showing that the time could be materially reduced.

FLOTSAM AND JETSAM.

—❖—
By "FLANEUR."

EARL ROBERTS has added to his many moving experiences that of being concerned in a motor-car accident, the result of which was that the driver of a restive animal was injured to a degree necessitating his removal to a hospital. Knowing how general is the rule that mishandling the reins is the prime cause of incidents of the frightening of a horse when motor-cars are about, I wrote to the gallant Field-Marshal, and asked him whether the rule or the exception was to be reported in this case. His lordship, with the ready courtesy for which he is famous, replied at once to my interrogatories, but assures me that "in this case no blame whatever was attached to the driver of the cart."

THIS is satisfactory so far as it goes, and we may all feel sorry for the injured driver who has fallen a victim to the waywardness of his quadruped. The consequences of the accident, however, might have extended to others, including Earl Roberts himself, and one cannot but enquire anew how much longer the use of ultra-nervous or half-broken animals is to be permitted on the roads, and whether some means cannot be found of making horses pass an examination before being driven on the public highways. Of course it is easy to understand how a fairly reliable horse may be slightly fluttered at the sight of something strange, but when an animal becomes absolutely ungovernable the matter is altogether different. Until good reason to the contrary is urged I shall continue to emphasise the point which all automobilists, to my thinking, should insist upon, and that is that when we meet a restive horse its owner has probably had many previous displays of the animal's ungovernable nature, and has no right to expose others—whatever he is inclined to do as regards himself—to the possibilities of accident through its perversity.

HUMAN nature in France appears to be prone to the same weaknesses as in England, where motor-cars are concerned, and despite the length of time that automobilism has been in vogue, there are still to be found those persons who are never so happy as when giving vent to the prejudices in which they are steeped. *La France Automobile* laments this week the fact that a motor-car may be observed proceeding at a moderate pace, and none of the bystanders appear in any way concerned, but that if any unexpected incident occurs the cry of excessive speed is immediately raised. A member of the staff relates an actual occurrence of this sort of which he was recently an eye-witness at Croix de Noailles. He saw a car, coming from Achères, suddenly swerve aside, and at the same time stop by the aid of the brakes, to avoid a cyclist who recklessly crossed the road from a side alley without looking where he was going.

"EIGHTY an hour!" cried a voice in the crowd, which at once surrounded the car. The journalist investigated; he found the car to be a 12 h.p. Panhard, and the change-speed lever was reposing in the second notch. This meant an outside speed of thirty kilometres (eighteen miles)—and the man in the crowd had cried out "eighty!" Small wonder that our contemporary should remark that in every case of accident one ought to place upon the evidence of witnesses "a large—very large—allowance for exaggeration."

Is it not singular that the owners of fast cars in this country have up to now made no attempt to do a rapid journey from John-o'-Groat's to Land's End? A steam car, it is true, has gone over the ground in eleven days, and a small petrol-driven voiturette has done the distance a shade more expeditiously. But these performances are enough to make a cyclist laugh and weep in turn, considering that G. P. Mills rode the distance on a safety in three days five hours and some odd minutes, including the crossing of various ferries. Of trade-assisted record-breaking I have no great opinion, but if an amateur like the Hon. C. S. Rolls, on his 24 h.p. Mors, were to drive right through, a performance might be accomplished which would simply

stagger the public, and impress them with the power of the motor-car in a way that nothing has so far succeeded in doing.

It would be perfectly feasible to observe the *convenances* in the towns encountered on the route, and still complete the distance in remarkable time, for there are long stretches of comparatively deserted, yet finely-surfaced, road, in which the car could travel on its accelerated fourth. Perhaps the speediest way to do the journey would be for the car to carry more than one skilled driver, so that the highest possible speed could be maintained without a strain upon the nerves of one individual, as turns of five hours each, or so, might be taken by the respective drivers. The distance would be rather over 900 miles, as detours would require to be made in order to avoid the ferries. With proper arrangements in advance as to supplies of petrol, water and food, and a careful scheduling of the route, the existing "end to end" record might easily be reduced by one half, and probably considerably more, instead of standing in an apparently unassailable position.

THE way old friends come up smiling in the motor-car world is occasionally amusing; it is certainly unsafe to regard a car as "gone under" by reason of its obsolescence. There was the little "Eureka" car, for example, with only a 2½ h.p. air-cooled motor to carry itself and its passengers. Since the 1,000 Miles Trial we have seen little of it; but lo! it now blossoms forth with a water-cooled motor, of increased power. Then there was the Clément-Panhard voiturette, with its very original type of body and—save the mark—tube ignition. Why did the Commandant Krebs, of Panhard fame, commit this apparently fatal error with a car so light, and therefore so easily overturned?

ERROR or no error, however, the car is again to the fore, but is now the *voiture légère* Clément, and is provided with electric ignition. The affix Panhard is no longer used, but the body is unchanged, in the smallest pattern, at least. Motors of from 4 h.p. to 6 h.p. are fitted, according to the number of seats. Another circumstance to be chronicled in this connection is the vitality of the quadricycle. So under-powered was this type with an air-cooled motor that it seemed doomed to extinction; yet now it is going stronger than ever with water-cooled engines of increased power. Even the great firm of Peugeot Frères are now pushing a four-wheeler, with 2½ h.p. motor, water-cooling, lever for starting from the seat, two-speed gear, easy access to the valves, clutch in the hub instead of crank-bracket, etc. It is put forward as a bid for the populace—*le véhicule démocratique par excellence*.

MESSRS. DUGGUA BROTHERS, of 18, 19 and 20, Raleigh Street, Plymouth, inform us that they now hold a stock of petrol grease, etc., which may be obtained by motorists at any reasonable hour.

FROM Messrs. Davies, Kent, and Stewart, of 41, Berners Mews, W., we have received a revised catalogue of their electrical accessories. We note that prices are in many cases reduced, and discounts increased.

WHILE Lord Roberts was driving in a motor-car near Walthamstow last week the noise caused the horse in a baker's cart to bolt, and the driver was thrown out and seriously injured. Lord Roberts had him lifted into his car, and drove him to the hospital.

A MEETING has been called for Tuesday next, in the Religious Institution Rooms, 200, Buchanan Street, Glasgow, in connection with the proposed establishment of a branch of the Automobile Club for the West of Scotland. The Right Hon. Sir J. H. A. Macdonald will preside, and everybody interested in the movement is cordially invited to attend.

THE motor-car which Mr. Arthur Vernon, of Amersham Hill, Bucks, purchased at the recent Exhibition appeared in the streets of the town on several occasions last week, and excited a good deal of interest and admiration. On Thursday of last week Mr. Vernon took the Mayor (Mr. Walter Birch) and one or two other gentlemen for a short trip on the car in the direction of West Wycombe.

AN IMPORTANT TRADE MEETING.

ON Tuesday last at the Automobile Club, with Sir Edward Jenkinson in the chair, a meeting was held to consider the future of automobile shows, as regards the number to be held annually in London, the place or places, and management of such shows. Incidentally it may be mentioned that at a meeting of the Automobile Protection Association held at the Agricultural Hall during the recent Motor-car Exhibition, the subject was discussed by a large and representative body of those principally interested as exhibitors. On that occasion there was absolute unanimity in favour of a resolution passed recommending that only one exhibition be held annually, and the one exhibition be held as heretofore—under the control of the Automobile Club (managed by Mr. Charles Cordingley)—and at the Agricultural Hall. To appreciate the present situation, it must be understood that owing to the growing interest taken in the motor-car movement there are now some half-dozen exhibitions about to be exploited, one being that of the Crystal Palace and Motor Traders' Co-operative Show, billed for February next, at the Crystal Palace. Though the manufacturer, who is principally concerned, realises the advantages which undoubtedly accrue from a well-organised and well-managed show, he is for obvious reasons indisposed to patronise each and every exhibition proposed. On the other hand, he is fully alive to the fact that he may lose ground by not being represented at some quite unimportant exhibition. It was in the hope of arriving at some definite and combined action in the matter of future shows that the Automobile Club called the meeting of automobile manufacturers and agents, who gathered to the number of some fifty on Tuesday last; but unfortunately with no definite result, beyond a spirited discussion, and the disclosure of some interesting facts concerning previous shows. On the motion being put to the meeting at an early stage—"That the manufacturers and agents here represented recognise that the Automobile Club held the first purely automobile exhibition in this country, has been, and is, the recognised authority to hold trials of motor-vehicles, and to give certificates therein, has rendered, and is rendering great service to the automobile movement of this country, they therefore consider the Automobile Club the proper authority to control exhibitions in this country, and seek that the Automobile Club should continue that control," there arose a dissenting voice. The owner of the dissenting voice objected to the word "control" on the ground that it was not fit or proper for a collection of business men exhibiting at a show to be controlled by a sporting club. An amendment which substituted the milder term "supervision" for the offensive word "control" was accepted. Mr. Friswell, who spoke strongly in favour of but one show, and that on the lines of the last, moved, "For one yearly exhibition only, to be held at the Agricultural Hall, under the present management, and under the patronage of the Automobile Club," and stated that he held twenty-one proxies in favour of his motion. Mr. Johnson also mentioned that as Secretary to the Automobile Club he had on the table over thirty letters from members who were unable to attend the meeting, expressing the same wish as to future shows. The question of proxies led to a division, resulting in their disqualification by a very small majority. Though attention was called to the fact that no less than six gentlemen voted for one firm represented, the count of hands held good. Proxies being voted out of order, an adjournment with a view to enabling interested parties, absent on that occasion, to vote at a future date was mooted. Further discussion of the various aspects of shows, past and projected, arose, in the course of which Mr. Johnson stated that the first Automobile Exhibition was held in this country by the Automobile Club, and resulted in a loss of £1,700. Since Mr. Cordingley had undertaken their organisation and management he had paid the Club £200 a year for its patronage, and it was hoped by this means to ultimately wipe off that loss. Mr. Cordingley stated that the first of the shows held under his management at the Agricultural Hall had resulted in a loss to him, the

last in a small profit; also that he had entered into a contract with the owners of the Hall to hold shows there annually for some years. On the question of the Club's liability to Mr. Cordingley, Mr. Staplee Firth stated that it had entered into a contract for one show a year, terminable at six months' notice on either side. There were four more years to run. The offer of a share in the profits made by the promoters of some of the proposed shows to intending exhibitors appeared to appeal to some present, but the possibility of profits accruing to unknown and unproved organizers was generally doubted. Mr. Johnstone, of Messrs. Lucas, called the attention of the meeting to the fact that the promoters of the National Show had, when approaching him on the subject of exhibiting there, stated that the Daimler Company and Motor Manufacturing Company had already secured their stands. Speaking on behalf of the Daimler Company, Sir Edward Jenkinson said that the statement was absolutely false, and Mr. Gretton denied the statement as far as the Motor Manufacturing Company was concerned. Mr. Sturme expressed an opinion that at future meetings to discuss shows, only manufacturers of and agents for motor-cars should be represented. Makers of parts and accessories would, he was sure, exhibit where the complete cars were to be seen. Finally, a long discussion was brought to an end by a resolution to postpone the meeting till such a date as the Automobile Club might fix, and a vote of thanks to the Chairman.

A NUMBER of summer resorts in America are planning automobile floral parades among their new attractions.

MR. CYRIL OWEN, of Bishop Street, Coventry, has secured the Midland agency for the Locomobile steam cars.

MR. D. H. CHALK, High Street, Fareham, is now keeping a stock of petrol. He is also able to undertake any necessary repairs.

THE Canadian Post Office Department has purchased two motor-vehicles, and will use them for collecting the mails in Ottawa.

THE British and Colonial Motor-Car Company, Limited, have taken up the sole agency for Europe for the "Ophir" steam car described in our last issue. Samples of the car can be seen at the company's depot at 14, Baker Street, W.

THE Board of Agriculture has notified the appointment of one of its inspectors, Mr. A. E. Brooke-Hunt, as its representative at the forthcoming Trials of motor-vehicles for heavy traffic. This makes the fifth Government Department which will be represented.

FROM Messrs. Morgan and Wright, of Chicago, U.S.A., we have received a clearly illustrated booklet containing instructions for the simple process of fitting their solid rubber vehicle tires to the wheels of motor-cars. Tools and appliances required are comparatively few, and their method is certainly worth consideration.

THE American Daimler Manufacturing Company, at Steinway, N.Y., which has heretofore confined its motor-vehicle output to delivery wagons, announces that it will produce during the coming summer a Mercedes type touring carriage with 16 h.p. motor equipment, and capable of a sustained speed of forty miles per hour.

THERE is a good opening at Warsaw for an india-rubber tire for carriages which will not splash as the ordinary tires do, especially on wood pavement. If the municipality can get hold of a really non-splashing tire which fulfils also other necessary conditions as to cost, etc., they will, according to a consular report, make its use obligatory.

FOR the first time, the Australian Royal Agricultural Society this year included motor-cars at its show, held at Sydney. Eight cars and three tricycles competed in the arena, the highest prize being given to a Renault voiturette. The Woods and the Winton Automobile Companies, of America, secured several medals, including one for the best and most varied display. A first award was won by the Austral Cycle Agency in the motor-cycle class for a De Dion tricycle.

THE Motor-Car Exhibition at the Agricultural Hall.

THE ENTRANCE TO THE ARENA.

[Argent Archer.

THE International Motor-Car Company, of 76, High Street, Marylebone, London, W., was another concern making a very large display. In addition to three or four of their well-known International cars on Benz lines to seat two and three persons, the company showed several of their "Charettes." To deal first with the former, we noticed a 4 h.p. two-seated phaeton having belt transmission and three speeds, and a $3\frac{1}{2}$ h.p. four-seated doctor's car on similar lines, but having three speeds and a reverse motion. Close by was a 6 h.p. four-seated phaeton; the motor has two opposite cylinders, the pistons of which work on to a common crankshaft; and the cranks work in an oil-containing case. Three speeds, by means of belts working on fast and loose pulleys, are provided, as also a reverse motion. A feature worthy of notice is the arrangement of the pedal controlling the hand brakes, the belts being all shipped on to the loose pulleys on the application of the brakes. The car is fitted with cycle-type wheels and solid rubber tires. Steering is controlled by a hand-wheel, so placed that the driver may sit either on the right or left side. The car, which weighs complete about 14 cwt., can attain a speed of twenty miles per hour. The International Company also staged several of the "Charette" cars, which appear to be meeting with a good reception at the hands of motorists. One of the cars was a three-seated "Spider" fitted with a $3\frac{1}{2}$ h.p. vertical engine, similar to that already described in the *Journal*. They have, however, recently introduced a car on similar lines, but fitted with a vertical engine, having a cylinder 4 in. diameter by 4 in. stroke, and developing 5 h.p. The motor is provided with electrical ignition, and has a water-jacketed cylinder, the circulation being on the thermo-syphon system with radiator. Two speeds forward and a reverse motion are provided, the power being transmitted from the motor (placed under a bonnet in the fore-part of the frame) by belts to a countershaft at the rear, and thence by gear wheels to the back live axle. The reverse motion is obtained by a slack belt, which can be tightened at will by the depression of a jockey pulley. The road wheels are of the cycle type, shod with pneumatic tires; ample brake power is provided, while the

steering is controlled by a horizontal hand wheel, around the column of which the various control levers are grouped. The motor-bonnet is hinged so that it can be lifted up to give ready access to the motor and its connections. Storage accommodation for water and petrol sufficient for an eighty-mile run is provided, and the car, which weighs complete about 8 cwt., can attain a speed of thirty miles per hour on good roads. Altogether, the International Company made a business-like show, and the way one of their "Charettes" was handled in the arena by a lady attracted a good deal of notice.

Steel channel frames for motor-cars exhibited by Messrs. Rubery and Co., of Darlston, combine lightness with strength. Specimens of channel sections, bent to every conceivable angle and curve, were also on view. A complete voiturette frame constructed on this principle has light steel angles for the body, and sides of woven corrugated brass wire, nuts and joints being conspicuous by their absence throughout. The "Castle" lock-nut is an ingenious contrivance which enables a pin to pass through the top of the nut and thus hold it in place. The stand was an interesting one, more particularly to the makers of motor-vehicles.

Some handsomely-finished cars were to be seen on the stand of the Progress Cycle Company, Limited, Coventry, foremost among which was a four-seated car with Mulliner body and hood. The motive power is supplied by a De Dion $4\frac{1}{2}$ h.p. water-cooled motor; a water-circulating pump and radiator being fitted. Two speeds are available, the car being able to attain a speed of twenty-two miles per hour. Steering is controlled by a horizontal hand-wheel, while the cycle-type road wheels are shod with 3 in. Dunlop pneumatic tires. In running order the car weighs about $6\frac{3}{4}$ cwt. Close by was a car of similar construction fitted with two speeds forward and one astern. The front seat of this car is pivoted, so that it can be reversed to enable all the passengers to sit facing forward or *vis-a-vis* fashion. The radiator in this car is fitted in the fore-part of the frame, and close to it is the water tank, which has a capacity of $4\frac{1}{2}$ gallons. Travellers should be interested in this car, which has been specially designed for their use, provision being made for the carrying

of a portmanteau at the front and also one at the back. The front one can be removed and a seat fitted in its place. The car is driven by a $3\frac{1}{2}$ h.p. water-cooled De Dion engine which gives a speed of twenty-four miles an hour. The exhaust on this car is claimed to be more silent than that of any steam car, the principle on which it works being quite novel. It forms a scavenger and increases the power of the engine 25 per cent., forming at the same time an absolutely silent exhaust. Another feature is the ease with which the motor can be started. We having set the engine going by merely a half-turn of the handle. The Progress Company also exhibited an example of the new two-cylinder vertical motor made by the Forman Motor Manufacturing Company, of Coventry. The engine, which is built on the Panhard and Daimler principle, is guaranteed to give 6 h.p. on the brake running at a speed of 850 revolutions per minute. The bore of the cylinders is 80 mm. by 110 stroke; the engine is fitted with a patent automatic oil feed. Manganese bronze bearings are fitted in the crank chamber, and anti-friction metal in the connecting rods. All working parts are hardened, and every part is made interchangeable to standard, so that there is no trouble in refitting parts. The engine can be fitted with electric or tube ignition, or both. The Forman Company have just taken over the old Simplex Gear Case Works, in Day's Lane, Coventry, and are laying down a plant to turn out the Forman motor in large quantities.

One of the largest, and certainly one of the most varied, displays was that of the Autocar Supplies, Limited, 66, Great Russell Street, Bloomsbury, London, W.C. The first vehicle met with was a nicely finished Renault car, with *tonneau* body, and $4\frac{1}{2}$ h.p. water-cooled De Dion motor. Adjoining was a Milwaukee steam car, which has already been described in another part of our Show report. A new steam-car was to be seen in the Britomobile, the boiler of which is fitted with a burner for the consumption of ordinary paraffin instead of petrol, and a patent condenser for returning the condensed water to water-tank. A car of French construction, new to this country, is the Malliary, of which a *chassis* was shown. There are a number of interesting points in the vehicle, [but as we hope to deal with them in a later issue we will only remark that it is fitted with a single vertical cylinder water-cooled engine, of $5\frac{1}{2}$ h.p. Three speeds forward and reverse motion, controlled by one handle, are available, the power being transmitted from the gear box by a longitudinal shaft and bevel gear to the live back axle. The Autocar Supplies, Limited, are introducing the Vinot-Deguingand car into this country under the name "La Silencieuse," and had an elegantly finished *tonneau* (Fig. 1) of this type on their stand. As a very complete description of this vehicle was published in our issue of January 19th last only a few particulars need now be repeated. The motor is of the two-cylinder vertical type, and is made in two sizes—5 and 7 h.p. The cylinders in the 5 h.p. engine have a diameter of 85 mm., the stroke being 130 mm.; the 7 h.p. engine has 84 mm. cylinders, by 161 mm. stroke, the normal speed in both cases being from 750 to 800 revolutions per minute. The inlet and exhaust valves are contained in the same casing, one above the other, in such a way as to be readily accessible. Both the cylinders and the explosion chamber are water-jacketed. The circulation is maintained by a small pump and radiating coil. Dynamo electrical ignition is employed. The engine is located under a bonnet in the fore part of the frame. On one end of the motor-shaft is carried a wide pulley, the power being conveyed by a single belt to a fast and loose pulley on a short countershaft at the rear of the differential shaft. Four speeds forward and a reverse motion are provided. The variable speed gear consists of a train of spur wheels on the countershaft, any one of which can be made to mesh with corresponding pinions on the differential shaft. The variable gear, which is controlled by a single hand lever at the driver's side, works in an oil-containing case of aluminium. From the differential shaft to the rear axle the power is conveyed by the usual duplicate set of sprocket wheels and chains. Provision is made for taking up any slack or wear of the latter. No friction clutch

is employed, the motor being thrown out of gear by means of a foot-pedal, the depression of which ships the driving belt on to the loose pulley. A foot-pedal actuates a band brake on the differential shaft, while there are band brakes, operated by a hand lever, on drums attached to the hubs of each of the rear wheels. Steering is controlled by an inclined hand-wheel, while the wheels are of wood, 32 in. diameter, shod with pneumatic tires. The 5 h.p. car weighs complete about 10 cwt. Another car new to England, but which has become very popular in France, is the "Hautier" (Fig. 4). This vehicle is very similar in general respects to the Renault and Darracq, the motor being placed under a bonnet in the fore part of the frame, the crankshaft and change-speed gearing being set at right-angles to the axles, and the power transmitted to a "live" rear axle by a universally-jointed longitudinal shaft. The main differences between the Hautier carriage and other makes of this popular type are to be found in the motor, the clutch mechanism, the universal joints, and the steering gear. The frame of the car is made of channel steel forged in one piece, bent to the desired shape and welded. The cross-tubular stays carrying the mechanism are welded to square ends, which slide into the grooves where they are bolted, and, while giving the necessary rigidity to the frame, the cross pieces can be easily removed with the machinery. The motor (Fig. 2), is of the vertical two-cylinder type. Above each combustion chamber there is a secondary chamber, V, of about one-third the volume. The secondary or expansion chamber is closed at the top by a milled head, which can be easily removed. In the centre of this fits a small cylindrical valve, X, kept under tension by a spring which acts upon it underneath. The cylindrical valve is connected by a rod with the valve which closes the bottom of the explosion chamber. The valves are operated by a cross piece which presses equally on the top valves by a rod and cam. When, therefore, the rod is in a vertical position, the cam presses down the cross piece and closes the top valves and opens the bottom ones, thus putting the secondary chambers into communication with the main combustion chambers. By pulling down the rod the cross piece rises under the action of the springs, the top valves open to allow of the products of combustion escaping, and the bottom valves close. In this way the compression in the cylinder can be varied at will. When the valve is closed the compression in the combustion chamber of course reaches its maximum, but when both chambers are put into communication it is attenuated by about a third. Both tube and electric ignition are fitted, and to explain the effect of the varying compression the action of the gases in an incandescent tube requires to be recalled. When the products of combustion are expelled from the cylinders there is always a certain quantity of burnt gas in the tube, and a fresh charge cannot be ignited until it has been sufficiently compressed to force the burnt gases into the end of the tube, so that the fresh explosive mixture may reach the hot metal. By varying the compression it will be obvious that the time when the fresh charge reaches the hot end of the tube may be advanced or retarded, this being possible by means of the secondary compression chamber. M. Hautier claims that his motor will run at any speed from 1,000 to 1,500 revolutions a minute, and that the power of the two-cylinder engine can be varied from four and a half to seven horse-power. Another point of interest in the motor is the mechanism for operating the exhaust-valve rods, A. A cam, G, engages with a rocking part, E, and causes it to move backwards and forwards as the projection on the cam comes into contact with each of the small rollers on the rocker. A similar motion is imparted from this rocker to a lever D, which is pivoted between the two valve rods, and which alternately lifts the one and the other of these. Coming now to the transmission gear, immediately behind the motor are the friction clutch, the progressive speed gear, and the change speed gear. The last named is composed of two trains of fixed and loose spur wheels. They are always in mesh, and are arranged for three speeds forward and a reverse motion. The loose wheels are keyed by sliding clutches, and in order to avoid any noise and shock in keying the wheels, and, at the same time, obtain any intermediate speed, M. Hautier has applied his progressive gear. Just in front of the gear box the shaft carries a

pinion running between two satellites which gear into the toothed inner circumference of a drum. The principle consists in graduating the speed of the shaft by resistance on the drum by means of a band brake. When there is no resistance on the drum the shaft turns at a normal speed, but by gradually increasing the resistance the speed of the shaft is lowered, and

FIG. 1.—“LA SILENCIEUSE” CAR.

stops when the resistance on the drum is equal to that on the shaft. In a word, it serves exactly in the same manner as a band brake, with the difference that the intervention of the satellites greatly diminishes the periphery speed of the drum as compared with the diameter of the shaft pinion. There is thus

FIG. 2.—SECTIONAL ELEVATION OF HAUTIER MOTOR.

comparatively little friction and an absence of any liability of the band brake on the drum becoming hot. The loss of power through such friction is also a negligible quantity, because, as the brake is applied, the motor slows down, and there is consequently no waste of energy. The advantage of being able to

brake upon the change speed shaft by a system which allows of what may be termed an elasticity in resistance, without wear and tear upon the parts, and with no appreciable loss of power, is seen in the fact that the speed of the shaft can be graduated as desired between any two fixed speeds until the sliding clutch falls easily and quietly into the

FIG. 3.—PLAN AND ELEVATION OF HAUTIER CAR.

loose wheels. There is also the further merit of permitting the vehicle to travel at any intermediate speed. Power is transmitted from the change speed gear to the balance gear on the rear axle by a shaft carrying at each end a connection of square section and tapering away slightly from the middle. The largest section fits easily into the square ends of the change speed shaft and the balance gear shaft, which receive it. But as

FIG. 4.—THE HAUTIER CAR.

the connection curves away from the centre it is free to move at a large angle each way. This angle is much bigger than is possible with the usual universal jointed shaft, while the system has the further advantage of allowing the shaft to be easily taken out in a few seconds. The water and petrol tanks are carried underneath the seat, and the radiator is placed behind so as to get the full benefit of the air which rushes in at the back of the vehicle. The steering wheel is mounted in such a way that it may be inclined to any angle to suit the driver, and fixed to that position by a bolt. The relative positions of the parts are seen in Fig. 3, where A is the motor, B is the progressive clutch (worked by the pedal, F), C the exhaust box, D the jointed shaft between

the change gear and the differential gear, P, M, and M' the water and petrol tanks, and R the side band-brakes. The motor and transmission gear being mounted on an independent frame, any type of carriage can be fitted. Fig. 4 shows a spider with 32 in. wood wheels and pneumatic tires. Another new petrol car is that known as "La Comfortable." This is fitted with a 8½-h.p. single-cylinder motor running at 900 revolutions per minute. Four speeds and reverse are fitted, the transmission being effected by a universally jointed shaft and bevel gearing to the rear axle. Of motors, samples of the "Abeille," "Buchet," and Aster were shown, while a special feature is being made by the company in supplying bodies of all types. Amid a big array of Ashton valves and other fittings for steam cars we noticed a new non-float feed carburettor to which we hope to refer in an early issue.

One of the leading attractions in the Minor Hall was the travelling caravan "Quo Vadis," exhibited by Messrs. Turgan and Foy, of Rue Carnot, Levallois, Paris. The vehicle, of which we give illustrations in Figs. 5 and 6, has, as is well known, seen much travel, having been taken by M. Turgan across France, and afterwards for a long tour in Algeria. The caravan is a very complete affair, fitted up complete with electric light, cooking arrangements, sleeping accommodation for two persons,

FIG. 5.—THE TURGAN-FOY STEAM CARAVAN.

and other conveniences. The frame, which is of strong construction, is carried by springs upon the front and rear axles. It is fitted with a cab in front, and the vertical boiler is placed between the driver and the main body of the car. The boiler (Fig. 7) has 10 square metres heating surface, and weighs about 13 cwt. The working steam pressure is 210 lbs. per sq. in. Coal is used as fuel, 6 cwt. being carried in bunkers at the front, said to be sufficient for a run of 60 miles. The water-tank has a capacity of 600 litres of water, which will run the vehicle for a distance of about 20 miles. A couple of feed-pumps are provided, as also an injector, while there is a large condenser on the roof. Each of the rear wheels is driven by means of a chain from a separate compound horizontal reversing steam-engine, access to which is afforded by doors on the sides of the vehicle. The cylinders are respectively 90 and 170 mm. bore by 120 mm. stroke. The normal engine speed is 600 revs. per minute, the engines developing 22 h.p. each. By this arrangement no mechanical change-speed gear is necessary, while, should one of the engines break down, the other is sufficient to propel the car home. The complete vehicle weighs about 4½ tons loaded. The maximum speed obtained from trials has been fourteen miles per hour. At a speed of ten miles per hour the vehicle has ascended a gradient of 7 per cent. Hand and pedal brakes are fitted, steering is controlled by a horizontal hand-wheel, the road wheels are of strong artillery type, with wide steel tires. We now come to the Turgan-Foy light cars (Fig. 8) of which three were shown—a 6 h.p. four-seated "Limousine," a 6 h.p. three-seated spider, and a 4½ h.p. three-seated spider.

The small engine has air-cooled cylinders with water-cooled heads, while the 6 h.p. motors have water-cooled heads; otherwise the general arrangement of the cars is identical, so that one description will suffice. First of all we have a two-cylinder motor placed under a bonnet in the fore part of the frame, and as this engine differs in many respects, both as regards construction and pose, from the ordinary type of petrol motor, a few brief details concerning it may not be out of place. The

FIG. 6.—SECTIONAL ELEVATION AND PLAN OF TURGAN-FOY CARAVAN.

two cylinders are horizontal and are disposed end to end, the crank shafts being vertical. Each piston works upon a separate crank shaft, both of which gear with a common central shaft, which they drive at half their own speed. The central vertical shaft carries a large fly wheel of the cycle wheel type, with heavy rim. By this disposition the constructors claim to have largely overcome the vibration difficulty, and the absence of the usually-employed horizontal crank shaft certainly saves the carriage springs from the jar arising from each downward impulse of the piston. Electric ignition is adopted, while the water

FIG. 7.—THE TURGAN-FOY BOILER.

circulation is maintained by a pump and radiator. The normal speed of the motor is 800 revolutions per minute. The engine transmits its power by bevel gearing to the clutch shaft, which is in the centre line of the car. The clutch, of which a section is given in Fig. 9, is of a special kind. The spring tends to wedge the two shells against the casing. To disengage

the clutch the collar to the right is moved longitudinally along the shaft into the position shown, acting against the spring. Four speeds forward and reverse are provided, the change speed gear being of the Panhard type. The counter-shaft from the gear box is connected by bevel gearing to a cross-shaft from which two chains, one at each side, transmit the power to the differential rear axle. A section of the combination

FIG. 8.—THE TURGAN-FOY TONNEAU.

double-acting band brakes and differential gear is given in Fig. 10, from which it will be seen that the chain wheels are fixed to the sleeves carrying the planet wheels. The lever, seen at the bottom, can be made to draw the two arms together; these are pivoted and act upon the brake shells, thus causing them to retard the planet wheels when the brake is applied. Steering is controlled by an inclined hand wheel, while provision is made to start the motor from the driver's seat. The frame of the car is built up of steel tubes; the wheels are of the artillery type shod with pneumatic tires. The 6 h.p. car weighs between 10 and 11 cwt., and can attain a speed of thirty miles per hour.

Messrs. Roots and Venables, of 100, Westminster Bridge Road, S.E., had on view their well-known heavy oil motor-car. This is a two-seated vehicle, fitted with 3 h.p. horizontal motor using ordinary petroleum oil, in contradistinction to petroleum spirit. The cylinder is water-jacketed; the storage tanks having a sufficient capacity for oil and water for a journey of about five hours. Two speeds are provided—two and fourteen miles per hour. The countershaft is chain driven, while the connection between the countershaft and the rear road axle is also by chain gearing and friction clutches. The low-speed chain is provided with a spring jockey wheel to take up

FIG. 9.—SECTION OF DOUBLE CLUTCH.—TURGAN-FOY CAR.

any slack, while for a similar purpose the rear axle is so arranged as to be capable of being moved on the springs. A feature of the Roots' car is the water condensing coil, which consists of a series of copper tubes fitted round the fly-wheel in such a way that the latter works within the coil. The car weighs, complete, about 6 cwt., and is fitted with cycle-type wheels and solid rubber tires.

Heavy petrol-vehicles formed the exhibit of Messrs. G. F. Milne and Company, Limited (Motor Department), Balderton Street, London, W. At one end of the stand was a portable petrol or alcohol motor of ten h.p. suitable for driving threshing machine and other farming machinery. The engine, a single cylinder one of the horizontal type, is fitted with Simms-Bosch magneto ignition, and will appeal to agriculturists in countries where

FIG. 10.—SECTION OF REAR DIFFERENTIAL AXLE.—TURGAN-FOY CAR, SHewing DOUBLE BAND BRAKE.

coal is difficult to obtain. Next we saw a couple of two-ton lorry frames of strong construction mounted on artillery wood wheels with iron tires, driven by an 8 h.p. vertical two-cylinder motor set in the fore-part of the frame. The engine is fitted with Simms-Bosch ignition, and provided also with a marine-type cooler and induced draught provoked by means of a fan driven off the engine-shaft in the rear of the cooler, only a half-gallon of water being carried. The change speed gear is on the Daimler or Panhard system, the longitudinal shaft extending to the rear of the frame, where it drives by bevel gearing a cross shaft, on the end of which are pinions gearing with internally toothed wheels bolted to the rear road wheels. The countershaft, differential gear, etc., are carried on an auxiliary radius frame depending from the frame proper. The braking power of these two vehicles is particularly efficient, taking the form of a double block locomotive brake on the driving-shaft, and two screw-down block brakes on the tires of the rear wheels.

Naturally considerable interest was evinced in the exhibits of Messrs. Panhard and Levassor, which were to be found in the Minor Hall. They were content to show two carriages, both of which were of the highest order of workmanship. The graceful

FIG. 11.—PLAN OF TURGAN-FOY CAR.

outlines of the cars and the fine finish were certainly noteworthy. The 7 h.p. light carriage is of the standard type, with a balanced two-cylinder motor, water-cooled by means of a pump and a radiator in front of the bonnet. There are three speeds and reverse all actuated by one lever, and a foot-brake on the differential acting whether advancing

or reversing. The band-brake on both rear wheels is operated by means of a lever. The steering is non-reversible with worm gearing. Electric and tube ignition are provided. The carriage body is also by Panhard, and is upholstered in dark green padded morocco. The dark green woodwork picked out with white lines is smart and artistic in effect, and altogether the car has a most taking appearance. The other vehicle exhibited was an 8 h.p. Panhard, on the firm's well-known lines, with *tonneau* body. There is plenty of room for passengers and baggage—an important point to which some makers hardly give the care in design that would be welcomed by users.

A couple of interesting cars were shown by the Metropolitan Motor Manufacturing Company, Ltd., of 116, Bayonne Road, Fulham Cross, Hammersmith, W. To deal first with the two-seated car, the features are to be found in the motor and the simple transmission gear. The frame (Fig. 12), which is constructed of channel steel, is supported on the axles by semi-elliptical springs. The rear axle runs in Mossberg roller bearings. The motor (Fig. 13), which is carried under the bonnet in the fore part of the frame, consists of two separate vertical cylinders which practically form two distinct motors. Each cylinder is cast in one piece with its water-jacket, and with a projecting flanged bracket. The crank chambers are made open at their external sides, but are fitted with cover plates which allow of easy inspection. The cylinder covers consist of flat plates which are provided with inlet and exhaust valves. The valves are thus in direct communication with the cylinders. The covers are secured in place upon the cylinders by bolts, and

FIG. 12.—PLAN OF METROPOLITAN MOTOR MANUFACTURING COMPANY'S CAR.

can be taken off by merely slackening the bolts. A cam-shaft is mounted in bearings above the cylinders, and it carries cams which press directly upon the caps of the exhaust valves. The inlet valves are operated automatically in the usual manner. Variable electrical ignition is employed, a shaft carrying a cam which makes and breaks the primary circuits of the induction coils. The upper cam-shaft is driven by two pairs of bevel wheels, through an intermediate vertical shaft, from the crank-shaft. In order to render this gear silent, a raw-hide wheel is used on the lower end of the vertical shaft and the bevel wheel on the cam-shaft is composed of mahogany with a metal boss and metal-toothed ring. The crank-shafts are coupled together by a central fly-wheel, on each side of which is fitted a belt pulley. The diameter of the cylinders is $3\frac{1}{2}$ inches, the stroke being 6 inches. The motor develops from 7 to 8 h.p., the normal speed being 750 to 850 revolutions per minute. The cylinders are water-jacketed, the circulation being maintained by a pump. The general arrangement of the transmission is shown in Fig. 12, while Fig. 14 gives a side view of the variable-speed gear. A rocking lever, which carries a pulley in bearings at each end, is mounted freely about the counter-shaft. One pulley is placed on each side of this rocker, and these two pulleys are connected by belts with the two pulleys on the motor shaft. Each of the rocking pulleys is attached to a pinion wheel, both pinions being continually in mesh with a toothed wheel keyed to the counter-shaft. The pinions connecting the two pulleys to the counter-shaft have different gear ratios, so that when one pulley is working the counter-shaft is driven at twice the

speed obtained when the other pulley is transmitting the power. The belts are of such a length that both are

FIG. 13.—SECTIONAL ELEVATION OF METROPOLITAN MOTOR MANUFACTURING COMPANY'S MOTOR.

slack when the rocking pulleys are in their mean position. In order to tighten either belt, it is only necessary to

FIG. 14.—THE METROPOLITAN MANUFACTURING COMPANY'S CHANGE SPEED GEAR.

rock the lever about the counter-shaft, which is done by a system of levers and a screw shown in Fig. 14, the driver rotat-

ing a concentric sleeve about the steering pillar, in one direction or another, according to which speed he requires. The gearing is easily manipulated, and a point to which attention is drawn is that any reasonable stretching of the belts does not interfere with its action. Either of the belts can easily be taken up when required, since they can be brought out in front of the car after they have been shipped off the rocking pulleys. The rocking lever in reality consists of a gear case which completely encloses the gear wheels. From the countershaft a single chain transmits the power to the rear differential axle. The road wheels are of the cyclo type, 36 in. and 28 in. diameter, and are fitted with solid rubber tires. The car complete weighs about 12 cwt. The second car was fitted with a roomy *tonneau* body, the back part of which is built high. The engine is of the same power and type as above described; generally speaking the transmission mechanism is on similar lines, but slight modifications have been introduced. Two speeds forward and a reverse motion are provided, and these can be instantly thrown out and the engine disconnected by slackening the driving belts. From the countershaft a couple of chains transmit the power to the rear axle. Inclined wheel steering, two pedal brakes, cycle type wheels, and solid rubber tires are other details of the car, which can attain a speed of twenty miles per hour and which weighs complete about 14 cwt. A part of this stand was occupied by the Creese Motor Starter Company, Ltd., of Blenheim Grove, Peckham, S.E., who exhibited a car the Daimler motor of which was fitted with their electrical starting gear. As we hope to deal with the arrangement at length in a later issue, we will only mention that by means of the device the driver of a motor-car fitted with an engine having two or more cylinders can, without leaving his seat, instantly start his engine at any time by simply depressing one of two or more buttons corresponding with the number of cylinders. This is done by a very neat electrical fitting by which the electric current is short-circuited to the sparking plug of whichever cylinder happens to contain the compressed charge ready for explosion when the engine is stopped. This is accomplished by means of an indicator, which enables the driver to immediately observe which button to depress, and consequently to fire the charge in the cylinder containing it, and so restart the motor.

The Simms Manufacturing Company, Limited, 55, Southwark Park Road, Bermondsey, made a big display of the Simms 3 b.h.p. air-cooled vertical and 3½ b.h.p. water-cooled vertical petrol motors. All are fitted with the Simms-Bosch magneto-electric ignition and with Simms's timing gear, by which the time of the ignition can be advanced or retarded, thus enabling the speed of the motor to be altered at will, the maximum being about 2,200 and the minimum about 200 revolutions per minute. By means of a constant level float-feed attached to the engine the supply of petrol is rendered entirely automatic, no regulation of mixing valves being necessary. It may be noted here that the cylinder and head of these engines are cast in one piece; the valves are arranged one above the other, the induction valve being self-contained, and so fitted that it can be readily removed. The 7 h.p. water-cooled engine described in a recent issue was also to be seen on this stand. The cylinder has a diameter of 110 mm. by 100 mm. stroke. Other exhibits on the stand included a Simms-Bosch magneto igniter arranged to give the ignition spark in four cylinders one after the other. A new form of rotary magneto-ignition apparatus for four-cylinder engines was also shown, in which the sleeve is rotated instead of the armature.

A vehicle which comprised a number of interesting features was the "Hallamshire," exhibited by Messrs. Durham, Churchill, and Company, of the Hallamshire Works, Trent Street, Athercliffe, Sheffield. The car, which is fitted with enlarged *tonneau* body, has a frame of channel steel and wood, supported by springs on artillery wheels shod with Clipper Michelin pneumatic tires. Power is supplied by a 7 h.p. Simms water-cooled single-cylinder vertical engine, set on the right-hand side of the car forwards. The motor is provided with Simms-Bosch magneto ignition, while the water circulation is on the thermo-siphon arrangement, a radiating coil being fitted in the fore-part of the car. On an extension of the engine-shaft is fitted a pair of

Champion friction clutches. On each side of the latter is fixed a pinion keyed to the clutch sleeve, the right-hand pinion giving a speed of eighteen miles an hour, and the latter a speed of eight miles per hour. Above the engine-shaft is carried an intermediate shaft furnished with three pinions, the outside wheels meshing with those already referred to, and the central wheel conveying the power at either speed to a toothed wheel keyed on a sleeve on the countershaft. This sleeve carries a central chain wheel, which is connected to a large sprocket surrounding the differential gear on the rear live axle by a 1½ in. pitch roller chain. The intermediate shaft already mentioned and the reversing gear-wheel shaft are both slung on links, which are controlled by a rocking lever, the actuation of which instantly and smoothly throws the reversing gear into action; the gear wheels giving the forward motion are always in mesh. A feature of notice is that the gear wheels are fitted with fibre discs at the side to ensure a quiet drive. The change of speed and reverse are obtained by the use of one lever only. By simply removing three nuts the whole of the gear box can be slid out from the front of the car in case of necessity. A pedal-applied band brake is fitted to the countershaft, double-acting band brakes on the rear wheel hubs, applied by pedal, being also provided. The steering is controlled by a sloping hand wheel. The front end of the frame is mounted on a central pillar, with a strong spiral spring permitting the wheels and axles to follow the curvature of the road without any corresponding deflection of the body. The steering connections are also so contrived that the rods can rise and fall with the axle, notwithstanding which the centres remain constantly fixed. Tubular radius rods are fitted to the frame to maintain a constant distance between the two chain wheels, while provision is also made to take up any slack in the driving chain. The motor bonnet is of aluminium; 4½ gallons of water are carried in a tank in front of the dashboard; the petrol tank is located behind the dash, and has a capacity of 5 gallons. The *tonneau* body, with which the car is fitted, will seat six persons; the weight complete is 11 cwt. The car is geared to a top speed of 18 miles per hour, it having been built for use in the hilly Peak district. A patent *tonneau* body, called the "As You Like It," was also to be seen. In the rear portion of this body the angle seats can be placed at will at either the back or forward angle of the rear portion, the seats themselves being secured to the bottom of the car by pivoted rocking links. With this arrangement the rear passengers can sit either facing the engine or as in a wagonette. Samples of the now largely-used Champion friction clutches were also shown on this stand. The male and female members of the clutch are held in engagement by means of springs, and taken out of engagement by means of the usual collar and lever. These are made in various sizes, and for reverse as well as forward driving. We may add that a Champion clutch has been supplied for use on one of the big 50 h.p. Napier racing cars.

A type of car well known in France, but new to England, was to be seen on the stand of Messrs. De Dietrich and Company, Luneville—a phaeton on the Amedée-Bollée system, a description of which was given in our issue of March 9th last. The engine is of the two-cylinder water-cooled horizontal type of 11 h.p. at 500 revolutions per minute. The power is transmitted by means of a long 5-inch belt off a pulley on the engine-shaft to a countershaft set well in rear of the back axle, upon which the change speed gear is mounted, and from which the drive is taken from the ends of the countershaft by means of bevel gear and driving rod to bevelled tooth wheels bolted to the spokes of the rear road wheels. The change speed gear, which is of the Panhard type, set transversely, has toothed wheels of very large diameter, presenting ample wearing surface. Four speeds forward and one reverse are provided, the gear shaft being also fitted with a ratchet arrangement to prevent the car running back on a hill. The belt is shipped from the fast and loose pulley by means of a pedal, and the sparking, throttle and change speed levers are all set conveniently beneath the steering wheel on the vertical steering column. The dashboard, which is of S-shaped form, forms the petrol tank, and a set of flanged radiating pipes similarly curved in front serves as a radiator, the

circulation being on the thermo-syphon system. The reversing lever is placed handily at the right side of the vehicle, and there is ample band brake power in the form of a wide drum of large diameter on each rear driving wheel, and a pedal-applied band brake on the countershaft. The car shown, which has been purchased by Sir John Campbell, has, we are informed, attained a speed of thirty-two miles per hour, and has carried nine people up the test hill in Richmond Park on the third speed.

The stand of the Motor Car Company, Limited, 168, Shaftesbury Avenue, London, W.C., was the centre of a large crowd of spectators all the week. Attention was principally devoted to the well-known "Decauville" cars, of which two sizes—5 and 8½ h.p.—were shown. The larger car (Fig. 16) has a frame of tubular construction, in the forepart of which is fixed the motor, consisting of two vertical cylinders of 3¾ in. diameter by 4 in. stroke. The normal speed is 950 revolutions per minute, and the maximum 1,400 revolutions. The cylinders form one solid casting, and the water circulation is obtained by a pinion pump placed in front of the motor. The ignition is electrical, with a neat form of positive contact ignition, a circular metal box being secured to the frame of the motor, and carrying a couple of swivel arms which are brought into

from accumulators. No belts or chains are used in the transmission, the engine being geared by means of a friction clutch and bevel gearing to the rear axle. Three speeds—roughly, 6, 12, and 20 miles an hour—are available, but the speed can be graduated between these by means of the variable ignition.

FIG. 16.—THE DECAUVILLE 8½ H.P. CAR.

Four band brakes on drums upon the rear axle are fitted, two of which bands are actuated by a pedal, and two by a hand lever. The motor is arranged to be started from the driver's seat, a hand-wheel being provided to the right for that purpose. Fig. 15 shows the improved "Eureka" car, which is now fitted with a 3½ h.p. water-cooled "Aster" motor, the water circulation being on the thermo-syphon system by means of a reservoir containing nearly two gallons of water, and fitted with radiators. The speed-changing gear is of the "Panhard" type, giving three speeds—7, 13, and 20 miles per hour—without advancing the ignition. The change-speed gear is enclosed in an aluminium case, and all the wheels run in grease. A friction clutch with reversed cones is fitted, which permits of an easy changing of the speed wheels. A Longuemare carburettor is employed. A pedal placed in the footboard of the car actuates the friction clutch. The speed change lever is fixed on the steering tiller, and has five positions, three being in gear and two constituting dead points. The latter are placed between each speed. The body is carried on suitable springs on the rear wheel axle, and all vibration from the engine is isolated from the rider's seat, which is extremely comfortable. The placing of the engine in the front of the car also is claimed to always ensure a good draught of air around it, thus aiding in keeping it cool. The mechanism is also readily accessible, as on a tricycle or quadricycle, and although the car may not be one of the best for heavy

FIG. 15.—FRONT VIEW OF "EUREKA" CAR.

contact with one or other of the platinum-pointed screws by the action of a cam cut on the half-speed shaft. The transmission is on the lines of that adopted on the "Darracq" and "Renault" cars, except that the change-speed gear box, operated through a clutch and longitudinal shaft, is located near the rear axle. The secondary shaft carries a bevelled pinion actuating a bevel wheel fixed upon the back axle. The variable gear is adapted to give three speeds forward and one reverse motion. The speed-changing cogs are placed in a hermetically-closed aluminium box. The three speeds are 8 miles, 17 miles, and 28 miles per hour, calculating at an average of 1,000 revolutions per minute of the motor. Steering is controlled by means of a screw and worm thread, commanded by an inclined hand-wheel. Both foot and hand brakes are fitted. All the parts on which strain is likely to be occasioned, as well as the bearings, are in mild steel. Fig. 17 represents the plan of the 8½ h.p. "Decauville" car, the motor and transmission being entirely mounted on an independent frame any type of carriage body—spider, phaeton, *tonneau*, or omnibus—can be fitted. We next examined a 5 h.p. "Decauville" car, of the type which some months ago ran a distance of 1,000 miles without a stop. This vehicle is driven by a two-cylinder petrol motor of 5 h.p., electrically ignited

FIG. 17.—PLAN OF DECAUVILLE 8½ H.P. CAR.

work on wet or stormy days, it is a great improvement on its predecessor, and will carry its two passengers at a good speed up any hills that may be encountered, while its ease of manipulation and accessibility of parts render it peculiarly useful to those commencing to use motor vehicles. Cycle-type wheels

shod with pneumatic tires are fitted. Of interest to users of acetylene lamps was a new generator, for which several advantages are claimed.

An interesting contribution to the exhibition was made by Mr. E. A. McLachlan, of 55, Brighton Road, Stoke Newington, N. On his stand was a two-seated petrol car fitted with a vertical water-cooled motor of $3\frac{1}{2}$ h.p. The frame is of angle steel, and the car has a special form of carburettor and electric ignition. The car, which is designed for tradesmen, commercial travellers, and the like, has 30 in. wheels with solid rubber tires of $1\frac{1}{2}$ in. cab section, and the vehicle has two speeds, two belts, and a chain at the side comprising the transmission. The body is supported on springs, the steering being by lever. The vehicle has a water capacity for 100 miles, and carries petrol for half that distance. Two brakes are fitted—a hand brake on the tires and a foot brake on the countershaft. This automobile was among the lowest-priced vehicles in the exhibition, and attracted much attention. Mr. McLachlan also exhibited a new single-cylinder engine of $2\frac{1}{2}$ h.p., a feature of which is the large inlet and exhaust valves, which are placed over one another. The provision of $1\frac{1}{2}$ in. passages does away with any risk of choking. The motor is watercooled. The crank chamber is of aluminium, and the fly-wheel is heavier than usual. Another feature of this display was McLachlan's petrol rudder motor. The cylinder is 2 in. diameter with a 2 in. stroke. The cylinder walls are air-cooled, while the head is water-cooled. The connecting rod is a long one, and is placed in a hollow tube. The screw is driven direct by a balanced crank working in a chamber, and has a reversible feathering propeller. Both the motor and the rudder and propeller gear are on one frame, and the petrol reservoir, the battery and coil, and the carburettor are in one metal case, the total weight of the complete apparatus being about 60 lb. The motor has a capacity for working for eight hours, and can be fixed to any boat without requiring any alteration in its construction. A small $\frac{1}{2}$ h.p. electric rudder motor was also shown. Specimens of a $1\frac{1}{4}$ h.p. petrol motor for bicycles, with a cylinder 2 in. diameter and 2 in. stroke, were also on view. This is of the air-cooled type, and has a speed of 1,800 revolutions per minute, the total weight being about 20 lb. The phosphor bronze fly-wheel has grooves which are first tinned, and then filled in with lead. A speed of twenty miles an hour can be attained with this engine. The "Lithanode" accumulator, sparking coils, etc., were also displayed, and the "Lithanode" 4-volt cells for De Dion engines. A new circulating pump, lighting accumulators, boiler, and engines for steam cars and casting were also on view at this stand.

A Pick voiturette and the Compin spring seats for motor-vehicles formed the attractions on the stand of the Langley Motor Company, of Park Square, London, and 521, High Road, Bruce Grove, N. The voiturette is fitted with a $3\frac{1}{2}$ h.p. water-cooled De Dion motor. This is carried on brackets to the rear of the driving axle, which it drives by gearing enclosed in a case. Two speeds forward are available. The engine is thrown in or out of gear, and a free engine obtained, by the action of a lever which projects up to the back seat of the car. The steering wheels are carried in bicycle-type forks linked together by the steering rod. Laminated spring extensions of the two longitudinal frame members are provided to which the steering sockets are attached, the result being a capital spring for the body. Among the other features of the Pick voiturette is a funnel-shaped channel or scoop with a wide opening to the front. By this means a current of air is drawn to the cylinder in the rear. The air, throttle, and sparking levers are to the left hand of the driver, regard having been paid to his convenience in this direction. Wheel steering and electric ignition have been provided, and a pedal controls the band brake on the countershaft, while another pedal connects with the tire emergency brakes. The Compin spring seats, which were also shown by the Langley Motor Company, have already been subjected to the test of experience in France, where they have been adopted by the Metropolitan Railway of Paris, and the Paris, Lyons, and Mediterranean Railway. Briefly described, the seats are constructed

of spring blades of tempered steel, properly bent, and arranged transversely; one of the extremities of each blade is made to work in a groove on the front of a light wooden frame, the other end being left free. This free end is provided with a gun-metal eyelet, or guide piece, which slides on a polished steel pin fixed to the back of the frame. Around the pin, between the free end of the blade and the side of the frame, is a small spiral wire spring which causes the blades, after the pressure, ceases to return to their original position. It is claimed that this method of construction secures comfort, cleanliness, lightness, strength, and durability—at the same time reducing vibration on a motor-car to a minimum.

The principal exhibit of Messrs. Linford and Willson, Bell Barn Road, Birmingham, was an 8 h.p. petroleum-spirit motor, the cylinders of which are set opposite to one another, with a central crank shaft. Special attention has been paid to the accessibility of all the parts. The connecting rods and pistons can, when the big ends are disconnected from the crank spindles, be withdrawn from the cylinders through the opening in the crank chamber, thus obviating all necessity for breaking joints of any kind. The induction valves are detached, with the sleeve, in which they are contained, by merely loosening two bolts, the exhaust valves being similarly arranged. The silencer is fitted immediately below and parallel with the opposite cylinders, so that lengths of exhaust tubing are entirely obviated. The water joints are independent of the gas joints, and the water circulation has been carefully considered. The normal speed of the engine is from 700 to 800 revolutions per minute. Samples of shafting, hubs, and axles made to specification were also shown, together with a strong and well made centrifugal pump.

The Sirene voiturette has achieved so much distinction in this country that Mr. E. W. Hart, of Luton, found its presence on his stand a sufficient attraction to the public. Upholstered and painted in dark green, white and chocolate, the cars shown were certainly of striking appearance and excellent finish. The features of the car are already well known. It has three speeds forward and a reverse. The motor gives 5 brake h.p., and over-heating is prevented by its nominal speed being only 800 revolutions per minute. Two automatic sight-feed lubricators are provided, and there is also a special lubricator for the crank chamber. Electric ignition, wheel steering, two powerful brakes, and a miniature Panhard gear with a direct drive constitute other points which conduce to the splendid hill-climbing capacity of the Sirene.

The National Gas Engine Company, Limited, of Ashton-under-Lyne, and 75A, Queen Victoria Street, London, E.C., exhibited their National (improved Otto) gas engines. One of these, the "L.E.," is capable of developing 5 e.h.p. and of generating a sufficient current for 50 16-c.p. incandescent lamps. Such an engine is admirably adapted for recharging the batteries for motor-cars, and might also light a country house. Type "N" has double the power of "L.E.," and type "V" develops 43 e.h.p. All three engines are fitted with patent air filters, and continuous lubrication at both ends of connecting rods. There is also a patent piston pin adjustment, by which the wearing surface is much increased, and the tendency to wear correspondingly diminished. The adjustment is of a very firm and rigid character. The side shaft is of a strength sufficient to ensure the steady running to which reference has already been made, which is further facilitated by the character of the wheels employed in transmitting the motion to the governor spindle. These wheels are of the skew gear type, preventing irregularities due to wear and admitting of a very strong construction. As the governor works in a vertical position the great advantages of the dead-weight with the spring are secured, and any alteration in the speed of the engine that may be required can be made without stopping it. The exhaust valve, seating, and spindle guide are part of the main casting, thus ensuring durability and preventing damage from overheating, as well as the fear of broken joints.

The exhibit of Messrs. Barriquand and Co., 27, Avenue de la Grande Armée, Paris, consisted of a four-cylinder vertical

water-cooled motor of the Daimler type made by Messrs. Eldin and Lagier, of Lyons. The engine is fitted with centrifugal governors, operating through two conical collars on a second shaft carrying arms and rollers, which cause the exhaust valves to remain closed when an excessive speed is attained. The cylinders are 110 m.m. diameter by 150 m.m. stroke, the power developed being put at 20 h.p. The engines, which appear to be well finished, are fitted with tube, electric, or magneto ignition at the desire of the purchaser.

It has been known for some time that the Bassett Motor Syndicate, of 10, Dorrington Street, Brooke Street, Holborn, London, E.C., has been at work on the construction of a new car in which the Bowden wire mechanism has been most ingeniously adapted to control the application of the brakes, the advance ignition, the exhaust valve, the throttle, the change gear, and the steering, a considerable reduction in weight being the result. The car, of which we give a general view in Fig. 18, is fitted with a 4 h.p. Schwanemeyer water-cooled motor of simple construction, and of which a description was given in our issue of May 26th, 1900. The motor, transmission gear, and rear axle balance gear are formed in one set of mechanism, all contained and arranged inside one aluminium oil chamber, no chains, belts, or bevel gear being employed. The motor has an auxiliary exhaust greatly facilitating the work of the scavenging stroke. The main exhaust is fitted with a speed governor, regulated from

FIG. 18.—THE BASSETT CAR.

the steering column. Electric ignition is adopted. All important revolving and reciprocating parts of the motor are fitted with roller bearings, reducing friction to a minimum. Two speeds are provided and are operated by one lever and Bowden wire acting on internal friction clutches, coupled to the rear axle balance gear, all gears being constantly in mesh. Powerful band brakes are fitted to the hubs of each of the rear wheels, and are applied by a lever under the right foot. The handles controlling the electric ignition, exhaust regulator and carburettor, also the levers working the change-speed gear and band brakes are all operated by means of the Bowden flexible mechanism; no cranks or rods being used, there is consequently nothing to work loose or rattle. The water cooling is effected by a centrifugal pump (driven direct off the fly wheel) forcing water around cylinder and through a radiator suspended at the front of the car. The rear seat and the portion of the floor to which it is attached is hinged or can be entirely removed for the purpose of oiling or inspecting the motor, and as the whole of the driving mechanism is self contained and forms part of the main axle, it is particularly easy of access. Three-and-a-half inch Grappler pneumatic tires are fitted on 28-inch equal-sized road wheels. By the arrangements they have adopted, 80 per cent. of the power developed is said to be conveyed to the road wheels, the makers claiming this to be the highest efficiency that has so far been attained.

The Ariel Motor Company, Limited, Bournbrook, Birmingham, exhibited a sample of the well-known "Ariel" 2½-h.p. motor-tricycle and the new pattern convertible quad, provided with 3 h.p. "Ariel" motor. The quadricycle has been improved,

FIG. 19.—THE ARIEL MOTOR WITH TWO-SPEED GEAR.

the motor being provided with a water-cooled head, and a two-speed gear. The water is passed through a flanged radiating pipe to one end of a long cylindrical tank behind the seat. The middle division of the tank contains the lubricating oil, and the other end the petrol. The "Ariel" two-speed gear is illustrated in Figs. 19 and 20. A is the motor shaft, a square portion of which carries a clutch sleeve, B. On this shaft A are also two pinions C and D, which may revolve freely on the shaft, or either can be held at will by the sleeve B, by means of jaw clutches. Parallel with the motor shaft A is a counter shaft E, carrying pinions F and G, both keyed to the same sleeve, which revolves freely on the counter shaft E, both pinions F and

FIG. 20.—DETAILS OF ARIEL TWO-SPEED GEAR.

G being always in mesh with the pinions C and D on the shaft A, the pinion C driving the large spur wheel on axle of tricycle or quadricycle. It will be seen that when the sleeve B holds pinion C, the motor is driving direct on to the large spur wheel on the

back axle; this, being the largest pinion, therefore gives the high speed. If, now, pinion D is connected to the motor shaft A by means of sleeve B, pinion C revolves freely on shaft A, but is driven by D, through F and G, thus giving the slow speed. When sleeve B is midway between the pinions C and D, the motor is disconnected, so that the machine can run down hill by gravity alone. All the pinions being constantly in mesh, it is a very easy matter to change the gear, pinions C and D running only at a slight variation of speed, the change being effected with little or no shock. The gear is entirely enclosed in a grease-containing chamber, bolted on the side of the engine-crank chamber. On a stand was also to be found a motor and combination tank, as fitted to frames of tricycles and quadricycles, with battery, induction coil, exhaust pipe and necessary tubes. All the parts which are comprised in a complete "Ariel" motor were shown, the workmanship of the latter being particularly noticeable.

M. Latil, 15, Boulevard Rabatau, Marseilles, exhibited by means of a well-executed drawing, the *avant train* or motor fore-carriage he has lately introduced. The motor, either a $3\frac{1}{2}$ or 5 h.p. "Aster," is carried in front of the forward axle, to which it transmits motion through a variable speed gear of the "Panhard" type, giving three speeds forward. The front wheels serve both for driving and steering purposes. The ordinary shaft is provided with universal joints arranged with their centres in the lines of the steering centres. The car, of which we hope to give a complete description in a later issue, is adapted for three persons.

Up in the Gallery were to be found Messrs. Cox and Yeman, of 184, Brompton Road, London, S.W., and of billiard-table fame. The specimen of the firm's art there exhibited was a table in oak, with panelling, chimneypiece, overmantel and furniture *en suite*, an exact replica of a 1606 room in old Bromley Palace. Messrs. Cox and Yeman devote special care to architects' plans. The above was a very fine specimen, both of design and workmanship. The adjacent billiard room for the use of members of the Automobile Club during the Exhibition was also fitted up by Messrs. Cox and Yeman.

An exhibit of their Grappler tires for motor-tricycles, motor-quadricycles, heavy and light motor-cars was made by the New Grappler Pneumatic Tire Company, Limited, 27 and 28, Clare Street, Dublin. They also showed a specially strong Grappler. One of the advantages claimed for this tire is that it can be repaired in case of accident, being hand-built, and not vulcanised and made harsh. It is built "to shape," and when inflated the cover and tube are normal, and not distorted. The tire will stand a great air pressure, and it is said to be impossible to blow it off the rim, while at the same time it is easily detachable.

Messrs. W. H. Wilcox and Co., of 36, Southwark Street, London, S.E., exhibited special semi-rotary motor pumps, for circulating the water into the cooling chambers of motor-cars. These have been adopted on the Daimler and various other pattern motor-cars with the greatest success, and have a large sale. The Penberthy patent injector for feeding the boilers of steam motor-cars was another of the firm's specialities largely in use and on view at its stand. The size of the injector, which is very small, renders it particularly adaptable to the requirements of the motorist, a very high pressure being obtained in spite of its Lilliputian dimensions. Their patent wire-bound hose, suitable for filling the boilers of steam-cars, was also on show. It is strong, durable, and exceedingly flexible; having no rubber in its composition it does not deteriorate or perish like rubber hose. A selection of all kinds of stores and sundries suitable for the manufacture of motor-cars was also on view.

To those whose interests lie in the making of motor-cars an inspection of the many exhibits made by Messrs. George Hatch, Limited, of 5, Upper Thames Street, London, E.C., must have proved instructive. Here every variety of tool and appliance capable of being used directly or indirectly by the "trade" was to be seen in its most up-to-date form.

(To be continued.)

HERE AND THERE.

AMONGST the licences recently granted at Brighton for omnibuses was one for a motor-omnibus to carry about twelve persons, to ply on such route within the borough as may from time to time be agreed on by the Watch Committee.

MESSRS. JAMES AND BROWN are now settled in their new premises at Hammersmith, 78a, Queen Street, close to the bridge. They have storage accommodation for about twenty vehicles, and are in a better position than ever for undertaking repairs.

THE twenty-second annual race meeting of the Chichester Cycling Club will take place in the Priory Park, Chichester, on Whit Monday. Included in the programme is a three miles motor-cycle race, three prizes, value £3 3s., £2 2s., and £1 1s., being offered.

WHILE a military band was marching through the streets of Brussels recently, a carelessly-driven motor-car charged into and knocked over the bandmaster. The musicians immediately put down their instruments, closed round the vehicle, and gave the driver a sound thrashing.

MR. J. T. NIBLETT, of 16, Coleraine Road, Blackheath, sends us particulars of an improved traction cell, which he is about to place upon the market. Small dimensions, light weight, mechanical strength, and high rate of discharge, are amongst the advantages claimed, which should commend it to the votaries of electricity as the propelling power of motor-cars.

MESSRS. ROOT AND CLARKE, of Station Road, Herne Bay, have been appointed official repairers to the Motor Manufacturing Company, Ltd., and Messrs. De Dion-Bouton, Ltd. The firm has large showrooms, and undertakes all kinds of repairs. Petrol and accessories are also stocked; as will shortly be a small motor-car of a new pattern which the firm is building.

AT a meeting of the Bexhill Urban District Council, the promoter of the scheme for running a service of motor-cars to outlying districts, referred to recently, divulged some interesting particulars. The cars are to be 12 h.p. Daimlers, and will be supplied by the Daimler Motor Company. Each of the four will carry fourteen passengers, and in the season it is proposed to convey visitors to such places of interest as Hurstmonceaux, Pevensey, Canterbury, Rye, and Tunbridge Wells.

A FIRE occurred last week at Glasgow which completely destroyed the works of the Mo-Car Syndicate, Ltd. The premises consisted of a brick building, ninety feet square and two storeys high, with five shed roofs running east and west, and a lesser building sixty feet by forty feet. The former was used as a workshop and manufactory, and the latter as a pattern loft and offices. As well as the premises, much valuable machinery was destroyed, and the total damage is estimated at £10,000 to £12,000.

MR. LOUIS SINCLAIR, M.P. for Romford, Essex, against whom a summons, taken out by the City Police, for driving a motor-car to the common danger of the public in the City, was dismissed recently, was on his way to the House of Commons at the time of the alleged offence, and being indignant at the action of the police, made a note of the names of the three constables who gave evidence against him. As a result the whole matter was considered by the City Commissioner of Police, and the three constables were highly commended and granted an extra length of leave to their usual annual holiday.

ONE of the most complete motor tire repair outfits ever designed has lately been introduced by the Dunlop Company. The outfit consists of a square tin box about $8\frac{1}{2}$ by $8\frac{1}{2}$ inches, $4\frac{1}{4}$ inch deep, and contains everything that can be needed for the roadside repair of the largest tires. The outfit comprises: Two 1 lb. tins of the best solution, one packet of patches and plugs, tire cleaner, two tire detachers, roll of prepared rubber in tin tube, roll of prepared canvas in tin tube, scissors, two small spanners, spare valve, two spare clamps, and one piece of masticated rubber for filling up cuts, etc.

It is reported that a motor-car service is to be started between Harrogate and Knaresbro'.

MESSRS. FRISWELL AND CO. inform us that petrol, lubricating oil, grease, etc., may be obtained from their West End depot, 1, Princes Road, Holland Park, W., at all times, Sundays included.

THE start of the Automobile tour in Ireland has been altered from August 12th to August 8th, as it was found impossible to get accommodation in Waterford on the 12th, owing to the Trammore races.

MESSRS. DONSWORTH BROS., of 11, Princes Road, Hull, are keeping a stock of petrol and motor accessories. They are official repairers to De Dion-Bouton, Limited, and the Motor Manufacturing Company, Ltd.

By an unfortunate error, the wrong illustration was inserted in the Locomobile Company of America's advertisement in our last issue. The car shown was a four-seated one, Style O5, the price being £300, not £160, which is the price of the company's two-seated car, Style O2.

THE Hozier Engineering Company, Limited, are exhibiting at Stand 92, in the Grand Avenue, Glasgow International Exhibition. They are showing one of their four-seated phaeton-pattern cars, fitted with New York tires, and also a gear box with the top of the lid cut out so that the change-speed gear can be inspected.

As a motor-car belonging to Messrs. Clamp, of Colchester, was being driven up North Hill, Colchester, one of the driving chains came off, and the car began running down the hill. The driver applied the brakes without success; then, with ready resource, steered for some large barrels standing outside a shop, scattering them in all directions, but effectually stopping the motor-car.

THE British Automobile Commercial Syndicate, of 97 and 98, Long Acre, London, W.C., in forwarding their current monthly price list, call attention to the large selection of motor-cars held at their London and Paris depôts, ready for immediate delivery. At the garage which the Syndicate has established motor-cars can be stabled, cleaned and oiled at a small weekly charge. The Syndicate also undertakes to supply qualified engineers.

A MEETING was held at the Town Hall, Preston, last week for the purpose of forming a local committee, to make arrangements for the reception of the vehicles which will be in competition on Friday, June 7th, in connection with the Liverpool Self-Propelled Traffic Association. It was resolved after some discussion that the waggon should enter Preston from Blackburn, go by way of Newhall Lane, Stanley Street, Park Road, Ormskirk Road, and rest for half an hour in the Covered Market. The journey will then be resumed to Liverpool, via Cheapside, Fishergate, and Fishergate Hill. All the arrangements were made, and Major Little promised to give every help on the part of the Police.

As already announced, the English Motor Club have decided to hold a Hill-Climbing Competition at Tilburstowe, Surrey, on Saturday, June 15th. Acting on the experience gained from last year, it has been decided to divide the competing vehicles into the following classes, viz.:—(1) Bicycles; (2) tricycles up to 3 h.p.; (3) tricycles above 3 h.p.; (4) quads up to 3½ h.p.; (5) light cars up to 7 h.p.; (6) cars (two-cylinder) up to 9 h.p.; (7) cars (three or four cylinder) up to 16 h.p.; (8) large cars (two, three, and four cylinder) above 16 h.p. In order to make the competition most interesting, and to give every motor-vehicle entered a fair chance of winning, it has also been decided (1st) to frame a handicap in each class, giving three certificates to the winners; (2nd) to frame a general handicap of the whole of the entries, giving three certificates in the order of merit of each class; (3rd) to award a certificate in each class to the motor-vehicle doing the actual best time in the said class; (4th) to give a gold medal to the motor-car or cycle doing the actual best time in the whole competition. After the contest a dinner will be held at the Clayton Arms, Godstone.

THE BLAKE NON-FLOAT FEED CARBURETTOR.

IN our last issue we referred to Mr. F. C. Blake, of Hammersmith, having brought out a new carburettor, noticeable on account of the absence of the usual float feed. We are now able to give a section of the apparatus. It will be seen that the lower portion of the device is partitioned off by a flexible diaphragm, E. The diaphragm carries a centre nozzle, D, which fits down upon a ball, F. A set screw, H, allows the position of the ball, F, to be adjusted, and the ball itself forms a valve which normally prevents the petrol, supplied through the pipe, G, from issuing out of the nozzle, D. Two adjustable air inlets, B and C, lead into the apparatus, the one (B) providing auxiliary cool air to the motor through the passage A, and the other admitting air to be carburetted by passing round the nozzle, D. A shield prevents the petrol from escaping through the air inlet, B, the shield also serving to mix the fresh air with the carburetted charge. The inside of the carburettor is left rough, in order to afford a large retaining surface for the liquid petrol. When the motor is making its suction stroke, the partial vacuum

formed in the carburettor causes the diaphragm, E, to rise, and permits some of the petrol to escape through the nozzle, D. The entering air then mixes with it and carries it to the explosion chamber of the motor. At the end of the suction stroke the diaphragm returns to its normal position, and in so doing it pumps a jet of petrol through the nozzle. This second discharge forms an evaporating film over the walls of the carburettor and is ready to be taken up by the air during the next suction stroke. Mr. Blake has fitted the carburettor to his own car, and he informs us that he is thoroughly satisfied with the results obtained from it.

MR. WALTER MUNN has been appointed Secretary to De Dion Bouton, Limited, in place of Mr. Charles Jarrott, who has recently resigned.

THE Electric Ignition Company, of Highgate Square, Birmingham, has forwarded us a pamphlet entitled, "A Few Words on Electric Ignition." The few words explain very clearly, with illustrations, the system of ignition followed by the company. Appended is a catalogue and price list of the company's sparking-plugs and some other appliances indispensable to the motorist.

The New Mors 10-h.p. Car.

HEREWITH we are able to illustrate a new 10 h.p. Mors car which is being introduced into this country by the Roadway Autocar Company, Ltd. The general arrangement follows the lines adopted on the well-known Mors 10 h.p. car recently described in the *Journal*. The new vehicle has, however, a longer wheel-base, and is fitted with a tonneau body having accommodation for six persons. The taking design of the vehicle and the reputation of its makers are strong points which will recommend the new car to the patronage of motorists.

FURIOUS DRIVING CASES.

BEFORE the Brighton Borough Bench, Eugene Chamery, of Hove, a French subject, was summoned for driving a light locomotive on King's Road on the 16th inst. at a greater speed than was reasonable, having regard to the traffic. Mr. J. K. Nye defended, and pleaded not guilty. Police-constable William Peckham said he saw defendant driving a motor-car on the front at the rate of about eighteen or twenty miles an hour, about seven o'clock in the evening. He stopped him, and through an interpreter defendant said he was only going ten or eleven miles an hour. Police-constable Lilywhite and a retired military officer both estimated the rate at which defendant was driving at twenty miles an hour. Mr. Nye, for the defence, submitted that the evidence for the police was more or less by guess, and showed variation. The car was not going at a greater pace than twelve miles an hour, it being regulated in such a way that it could not exceed that speed. Defendant was sworn, and said that on the evening in question he drove two gentlemen from King's Gardens to the New Club. The car was then so regulated that it was going at fifteen kilometres. Frederick Ricketts, who was in the car on the evening in question, said they were certainly going not more than ten miles an hour. A fine of 40s. and costs, or twenty-one days' imprisonment, was, however, imposed.

AT St. Neots Petty Sessions, S. D. Begbie, of Willesden, was charged with driving a motor-car upon the highway at Buckden at a greater speed than twelve miles an hour, on 29th April. Defendant did not appear, but Superintendent Freestone proved the rate of travelling—900 yards in one minute. The Bench inflicted a fine of £8, and costs, 16s.

AT the Bradford City Court, Mr. Grahame White, manager of the Yorkshire Motor-Vehicle Company, was summoned for furiously driving a motor-car in Lister Park on Sunday, 21st April. The defendant did not appear, but it was stated that he told a constable that he was not driving at more than eight miles an hour. Mr. H. Hankinson, Deputy Town Clerk, said that during the "church parade" on the day named the defendant drove his car up the drive leading from Manningham to Heaton and back again at the rate of fourteen or sixteen miles an hour, the people being scattered in all directions. The defendant had been previously fined for furious driving, and the Stipendiary now inflicted the maximum penalty of £2 and 14s. costs, regretting that he could not fine the defendant £10.

AT Ruthin Police Court, Chancellor Bulkeley Jones presiding, Mr. Grahame White was summoned for furiously driving a motor-car at Ruthin on 4th April. Defendant did not appear. Police-constable Howells said the defendant drove the car through Well Street, Ruthin, at the rate of twenty or twenty-five miles an hour. Had anyone come out of a cross road, there would have been no chance of escape. Alun H. Williams, clerk to the magistrates' clerk, said the motor-car passed his house at a terrific rate. The Bench imposed a fine of 40s. and costs.

SIDEY SHAW, Rowfant, was summoned for furiously driving a motor-car at Three Bridges on the 3rd inst. Defendant pleaded not guilty. Police-constable Cobby said about 10.45 a.m. on the day in question he was on duty at Pound Hill, Three Bridges. He heard a motor-car coming in the distance. As it neared witness he found that it was going at a very dangerous pace. Witness put up his hand, but defendant took no notice. He should say the motor was travelling at the rate of twenty miles an hour. Peter Denman, Pound Hill, Worth, an old man, spoke to seeing the motor-car pass the four crossways very fast. He had only seen one or two motor-cars altogether. He should say that the pace exceeded twelve miles an hour. The Rev. D. L. Secretan, Curate of the parish of Worth, described the pace as fast. He had no idea as to what the pace was; that was difficult to say. Defendant contended that his car could not go more than ten miles an hour, as it missed its explosions one in every three. The Bench dismissed the case, the Chairman remarking that he hoped the defendant would in future drive at a moderate pace.

AT Birkenhead William Beckett Hill was summoned for driving a motor-car on the Chester road at a speed dangerous to the public. Mr. M'Masters, who appeared to defend, applied for an adjournment pending civil proceedings; but the Bench decided to hear the evidence as to speed. Joseph Hesketh, cab driver, said he was walking his horse and cab through Bromborough Village on the evening of the 1st inst., when he saw a motor-car coming towards him at a terrific rate. He signalled for the car to slacken off a bit, but instead of that it ran into witness's horse. He was sure the car was going at least twenty miles an hour. Both shafts of the cab were smashed in the collision, but he could not say whether the horse put one of its feet on the car, nor whether the shaft struck the lady in the motor. Three other witnesses said the speed of the car was twenty miles an hour. Mr. Hill stated that he did not travel more than eight miles an hour, and he gradually slowed down, and stopped the car. Other evidence was adduced that the speed of the car was not at all high. The magistrates said that they had nothing to do with the collision, but they were satisfied the speed of the car was too great, and they imposed a fine of 10s., with 10s. costs.

BEFORE the County magistrates at Coventry, a machinist named Henry Cantrill was summoned for driving a motor-cycle, in the Birmingham Road, "to the common danger of passengers," on 10th May. Defendant pleaded not guilty. Police-constable Vale said that on the day in question he saw the defendant near Pickford's Brook riding on the "flat mile" from Coventry at a furious rate, which witness estimated as between twenty and twenty-five miles an hour. He stopped the defendant, who said that he had been sent out by Messrs. Bayliss, Thomas and Co. to test the capabilities of one of their "Excelsior" motor-bicycles. Answering the defendant, the officer said that defendant stopped when called upon. He (the constable) estimated the speed by timing him for

500 yards. Police-constable Vale, in answer to Alderman Hill, said it was possible to time a rider with accuracy on this straight stretch of road by the aid of the telegraph poles. The defendant said that he was riding "an old crock," and he could assure the Bench he was not going more than twelve miles an hour. The Chairman said the Bench were very unwilling to put restriction upon the trial of these machines, but this was a wrong place to try one. A fine of 10s. and costs only would be imposed.

At Bristol Police Court, Lawrence P. Still was summoned for driving a motor-car "in a furious and improper manner, to the common danger of the public." Mr. Douglas Metcalfe represented the defendant. Detective Slade stated that on the 30th of last month he observed the defendant driving a motor-car from Southampton Parade to White Ladies Road. On reaching the latter thoroughfare several people had to run in order to get out of the way of the car. Witness subsequently visited defendant, and asked him if he remembered being in White Ladies Road on the evening in question. Defendant said he could not have been there, as he was at Filton with a lady. Subsequently he admitted that he might have been in White Ladies Road. The Chief Constable said that on the night in question, about 7.15, he was crossing White Ladies Road, when he observed a car sweeping down upon him at such a pace that he had to "skip" out of the way as well as he could, and was very nearly caught. The car was going very fast, and it was being driven most recklessly, as not the slightest deviation was made to avoid him. He could not inform the court who it was driving the car. Plain-clothes officer Saunders corroborated Slade's evidence. Fredk. Fielding, cab driver, who recognised the defendant, said the pace was from ten to twelve miles an hour. Mr. Metcalfe contended that the case was one of mistaken identity; that defendant could not have been in White Ladies Road at 7.15. The defendant said that he started from Charlton on the night in question at 7.5. A lady who had accompanied him in his car alighted at the bottom of Blackboy Hill. He then drove down White Ladies Road, keeping in front of a tram-car, and then turned into Southampton Parade. He made a purchase in this thoroughfare, and then proceeded up Cotham Hill and passed through Aberdeen Road to White Ladies Road. He followed behind the tram-car up White Ladies Road. The pace at which he was travelling did not exceed eight miles. The magistrates were satisfied that it was a case of mistaken identity, and the summons was accordingly dismissed.

At Iver (Bucks) Petty Sessions on Saturday last, Mr. Mark Mayhew, L.C.C., of Rehampton, Surrey, was summoned for driving a motor-car to the common danger at Denham, on April 28th. Evidence was given by a constable that the motor-car came down a hill at a terrific pace; he put up his hands, and the driver pulled the car up after going sixty yards beyond him. Mr. Staple Firth, of London, who appeared for the defendant, contended that there was no case for him to meet, as no evidence had been given that there was a person on the highway. The Bench held that a *prima facie* case had been made out. Mr. Firth said he should appeal to the High Court on the ground that there was no evidence of persons being on the highway in danger. A fine of 10s. and 8s. 6d. costs was imposed, but a stay was granted pending decision of the High Court.

TRACTION-ENGINE OR MOTOR-CAR.

At Aberdeen J.P. Court last week the Speedwell Motor-car and Cycle Company, Limited, Aberdeen, were charged with having, on 5th April, driven a locomotive along West Hutcheon Street, and also with having, on 11th April, driven a locomotive along Rosemount Place, without having the requisite number of persons in charge, there being only two persons instead of three. Mr. Rennet, solicitor, who appeared for the company, stated that the whole question was whether this motor-lorry was a light locomotive or not. It was averred that it emitted smoke and vapour, and the company held that there was no smoke, and wished to get an experienced man to examine the machine in order to be able to say whether there was or not. The Procurator-Fiscal said he might also inform Mr. Rennet that he was to prove that one of the locomotives was shod on the wheels the very same as an ordinary traction-engine. Mr. Rennet asked that the case be adjourned for a fortnight. It was a matter of great importance to the company, because if it was held that this was a locomotive it would practically mean that they would have to stop carrying on business. The Fiscal objected to such a long delay, unless a guarantee was given that the machine was not to be used. It was agreed to adjourn the case for a week.

Donald Donaldson, the driver of the machine, was charged with driving a locomotive along Hutcheon Street West and Rosemount Place on the dates specified during hours in which locomotives were prohibited by the bye-laws of the city. Accused pleaded not guilty, and it was explained that the same question arose here as in the previous case. It also was adjourned for a week.

A FATAL ACCIDENT.

A MOTOR-CAR accident occurred last week at Knaresborough, near Harrogate, resulting in the death of Frederick George Oxby, of Doncaster. The car, which has been running between Harrogate and Knaresborough, was making the journey to the latter place, and running down hill into the town, when the driver applied the brakes. They failed to act, and the

tires came off the front wheels. The deceased jumped out of the car, unfortunately in the opposite direction to which the vehicle was travelling, and his head coming into violent contact with the kerbstone, he was instantly killed. At an inquest subsequently held some evidence was given as to the brakes on the car not being in accordance with the requirements of the Light Locomotives Act. The Coroner remarked that it seemed a case in which there was serious liability on the part of someone, and adjourned the inquest.

IN THE MIDDLE OF THE ROAD.

Mr. J. PALETHORPE, a gentleman residing in Birmingham, was summoned at Halesowen for contravening the Light Locomotives on Highways Order, 1896, by failing to keep a motor-car on the left side of the road when meeting a carriage on the 29th ult. It was alleged that the defendant drove the car on the centre of the road instead of on the near side, with the result that Major F. D. Lea-Smith's horse shied, and the carriage went into the hedge, some slight damage being done. Mr. Baker said the defendant had driven several thousand miles, and had been awarded a gold medal for proficiency. The Bench held that an offence had been committed, and fined defendant £3 10s.

A COLLISION CASE.

At Wellington County Court, George Downes, a plumber, of Newport, sued H. Caley for the sum of £26, for damages in respect of alleged negligence on the part of the defendant in driving a motor-car. Mr. Elliott (Newport) stated that early in February his client, while driving in a trap with his son in the direction of Wellington from Newport, met the defendant in a motor-car approaching him at a rapid rate. He raised his hand to the defendant, and called out to him to stop, as his horse, at the sight of the car, became restive; but instead of doing so, the defendant continued at the same pace and crashed into his client's trap, which was damaged considerably. The cob took fright and ran away, the plaintiff and his son being left in the road where they had been thrown. Downes suffered from shock, for which a claim was made, and the incident had had such an effect on the cob that it had not been so manageable since. Mr. Littlewood repudiated all liability on behalf of his client, stating that the car did not belong to him, and though an occupant, he was not in charge of it. A controversy ensued as to what course might be pursued in view of Mr. Littlewood's statement, and an adjournment of the case for the particulars to be amended was suggested. Ultimately Mr. Littlewood consented to the driver of the car, John William Kidd, works engineer at the Castle Car Works, being added as a defendant, and Mr. Elliott proceeded to state the law relating to the use of light locomotives on highways. Mr. Kidd denied that the plaintiff signalled to him to stop, and said it was not until the horse got abreast of the motor-car, whose speed had then been reduced to six miles an hour, that it became restive. Then it swerved suddenly round, and backed the trap into the motor-car. This evidence was substantiated by Mr. Caley, by Mrs. Caley, and a witness named Haddock, a pedestrian, who was passing at the time. His Honour, in summing up the case, said it was the first of the kind that had come before him. Motor-cars had as much right on the highways as traps, but those in charge were expected to take special precautions to avoid accidents, seeing that horses were so liable to be startled by them. In this case he did not think the driver of the car could have done more than he appeared to have done, and he believed the plaintiff was under a wrong impression about giving as clear a signal to the driver as he had stated he had done. Judgment was given for the defendants.

AN inquest was held recently on the body of a Lincolnshire farmer. Deceased was one of an afternoon motor-car party, and on returning at night he was missed. Nothing further was seen or heard of him till next morning, when his body was found in the mud of the river Whitham. A verdict of "Found drowned" was recorded, and the incident has gone the round of the press headed, "Strange Motor-Car Fatality."

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, JUNE 1, 1901.

[No. 117.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT the dawn of automobilism in this country more stress was laid on its future value from a business than from a pleasure point of view, and special expectations were raised among circles interested in heavy goods traffic, which have hardly yet been realised. It is true that great advances have been made in this direction, which it may be hoped will be brought prominently before the business public by the forthcoming Liverpool trials, but the rapid strides in popularity of the motor-car for passenger purposes make its tardy spread for industrial ends noticeable by comparison. Though the development of heavy goods wagons has been undoubtedly impeded by the weight limit, this has had little injurious effect on those of more moderate capacity, and a mistaken conservatism alone has prevented their wider use, while the proposition that these latter should be encouraged at the expense of the more ponderous vehicles is at least capable of being maintained with some reason from the point of view of the road authorities. Light, fast traffic should have the prior consideration on the road, and it is precisely this traffic which is best served by the automobile; heavy manufactures may require the 5-ton wagon, but the opening up of country districts and the economical conveyance of their products is a problem to be solved by the aid of such motor-vehicles as do not sacrifice speed to large capacity.

The Reading Automobile Club.

ON Saturday last, the 25th ult., some of the members of the Reading Automobile Club started upon a tour to Wells, Glastonbury, and Cheddar. The trip was highly appreciated by all taking part, and was marked by the most conspicuous absence of any trouble to the cars, which practically required no attention whatever from start to finish. Good fortune favoured even the tires, the puncture fiend having apparently availed himself of the holiday season wherein to take a rest from his ingenuity. The most exciting incident of an "accidental" nature was contributed by one of the Vice-Presidents of the Club inadvertently cooking his sandwiches upon the exhaust pipe. His appetite and enthusiasm prompted him to sample the delicacies, but both faltered before the various flavours of exhaust, lubricating oil, and ham fat in a state of dissolution. The tour was in every way an unqualified success, and the members taking part in it returned refreshed, though dusty, after a capital ride through beautiful scenery.

The Dust Nuisance: a Competition.

IN connection with the dust question, which has been alluded in several of our recent issues, we are able to announce that the Committee of the Automobile Club has decided to offer a prize of 100 guineas and a diploma for a practical method of removing or alleviating the nuisance of dust arising from motor-vehicles fitted with pneumatic tyres. The trial will be held as soon after August 1st next as the Committee are in possession of particulars of devices which, in their opinion, might be effective.

The Lincolnshire Automobile Club.

TO-DAY (Saturday) the members of the Lincolnshire Automobile Club will hold a run to Revesby. In order to avoid the inconvenience of too many cars running in company members will meet at the Red Lion, Revesby, at 4.30. After tea, at 4.45, Revesby Abbey will be visited, by permission of Mrs. Stanhope, and the road for Lincoln taken about 7 o'clock. The Lincoln contingent will leave headquarters at 1.30, proceeding *via* Horncastle, and returning *via* Tattershall and Metheringham. The Club will also hold a run to the "Dukeries" on Wednesday, June 12th, and will take in Edwinstowe, Welbeck, Clumber, and Thoresby. The Lincoln contingent will leave headquarters at 9.45, *via* Tuxford. Luncheon will be taken at the Royal Oak, Edwinstowe, at 12.15, and tea at the Normanton Inn, at 5.30.

Southampton's Municipal Motor-Car Service.

AT the meeting of the Southampton Town Council last week the report of the deputation appointed to deal with the question of motor-omnibuses was read and adopted. The deputation had visited Nottingham, where the assistance of the Chief Constable was sought. The latter assured them that the public appreciated the service, that the cars had been kept fairly well on the road, and that they need have no anxiety as to the results of such a service as a feeder to the tramway system. The deputation were satisfied with the information they gathered in Nottingham, and felt no hesitation in proceeding to Coventry and finally placing the order with the Daimler Company for three cars, to be delivered about the middle of July. Of these three cars the deputation advised the Tramways Committee to keep two on the road and one in reserve, by which means each car will be kept in a perfectly efficient state. The motor-cars are to run to Tandners' Brook, and from the Clock Tower to the Floating Bridge.

The Paris-Berlin Race.

THE French Automobile Club, desirous of making the Paris-Berlin race a most important event, have appealed to manufacturers to subscribe to a fund to provide substantial money prizes. A special train will also be chartered to follow the race. It is now almost certain that the whole of the Panhard and Levassor stable of 40 h.p. cars will compete, and be driven by Messrs. De Knyff, Charron, Girardot, Voigt, Loysel, Giraud, de Périgord, de Chasseloup-Laubat, Pinson, and Leys.

A Popular Proverb Illustrated.

A SMALL mishap occurred in Farnham last Sunday, which afforded some amusement to the spectators, if not to the actors in it, and may give a timely caution as to the necessity under certain circumstances for extra efficiency in motor horns, as its lessons to the other parties concerned will probably fall on stony ground. A car with two occupants was overtaking a milk-cart, which persisted, in spite of repeated and continuous blasts, in keeping its wrong side. As the motor came up, a man hastily jumped down from the back of the cart, with the object, as the motorists evidently thought, of holding the horse, so they

attempted to pass on the left side; the man, however, seized a milk-can, and without looking round, rushed in front of them, and though a timely swerve and application of the brakes enabled them to avoid him, his can caught the mudguard and discharged its contents—more than a gallon—over the lady occupying that side of the car. Mutual recriminations ensued, the milkman asserting he had not heard the horn—a statement which was evidently true, though not excusing his being on the wrong side; and the ultimate conclusion was that honours were about even, the lady taking her milk bath most philosophically and both sides recognising the proverbial inutility of lamentation under the circumstances. The risk arising from vehicles so noisy as to prevent a horn being audible is, however, obvious, and milk-carts are among the worst of these offenders.

The A.C.G.B.I. Motor-Cycle Race Meeting.

THE Automobile Club will hold its motor-cycle race meeting on the track at the Crystal Palace on Saturday, July 17th next. The following is the programme as so far arranged. 1. One Hour Scratch Race for motor-cycles for the Autocar Challenge Cup (perpetual trophy). Club medals to first and second. Holder, Mr. F. F. Wellington. The record for the track was beaten in this race last year. 2. Five Miles Handicap for touring motor-cycles for the *Motor-Car Journal* Challenge Cup (perpetual trophy). Holder, Mr. F. F. Wellington. Club medals to first and second. This race has been altered from a scratch race to a handicap by permission of the holder. 3. Ten Miles Handicap for all classes of motor-tricycles for the *Automotor Journal* Challenge Cup (perpetual trophy). Club medals first and second. 4. One Mile Open Handicap for motor-bicycles for Cup offered by Mr. Campbell-Muir. Club medal to first and second if more than six starters. Entries on forms to be obtained of the Secretary of the Competitions Committee of the Automobile Club, close on Monday, July 12th. For the above races, both riders and machines must be registered according to rules of the A.C.G.B.I.

THE SCOTTISH AUTOMOBILE CLUB'S RUN TO SELKIRK: THE PARTY AT MR. W. S. STEEL'S RESIDENCE AT PHILIPHAUGH.

A Motor-Car Meet at Spalding.

THERE was a very interesting display of motor-cars at Spalding on Monday, on the occasion of the meet of the Lincolnshire Automobile Club, although, owing to the holidays, many of the members had gone out further afield on lengthy tours. After a lunch, provided by the Ayscoughfee Hall Committee, the cars went together to the Ayscoughfee Hall grounds, and there paraded in a large enclosure, round which there were many thousands of people. The motorists included Mr. Belcher, works manager of Humber's Works, Beeston, on one of the new cars just turned out by that firm; Mr. Ross Browne, of the Nottingham Club, on a sister car; Mr. C. Lovett, of London, on a 10 h.p. Benz car; Mr. R. H. Kirk, on a 12 h.p.

Peugeot; Mr. Beales, of Spalding, on a 3 h.p. Benz; Mr. Dennis, of Kirton, on a new Progress voiturette, and Mr. C. Holland, of Boston, on a Progress car, his son driving a 2½ h.p. Progress tri-cycle. Mr. C. Nelson drove his Benz, and Dr. E. Cragg, of Billingborough Hall, also drove a Benz, while Mr. R. M. Wright, of Lincoln, drove down after the parade on his Progress voiturette. The party were afterwards conducted round the beautiful garden and hall, which are being bought for the town.

The Incorporated Society of Municipal Engineers.

AT the conference of the Incorporated Society of Municipal Engineers, which is to be held in Leicester on June 28th and 29th next, it is proposed that the members of the A.C.G.B. and I., and of the Nottingham and Midland Automobile Clubs, should take the members of the Society for a drive on Saturday, June 29th, from Leicester, and, further, that a paper should be read by a member at the conference. The Nottingham Automobile Club hope to provide seats on motor-vehicles for fifty members of the Society and members of the A.C.G.B. and I., and the Midland Automobile Club are to be asked to drive their vehicles to Leicester to take the remaining hundred engineers. A luncheon will be given, to which members of the various Clubs bringing cars will be invited to join the members of the Society of Municipal Engineers, probably at about 1.30 p.m., and also to a sort of high tea and other refreshments later on in the afternoon. The Committee of the A.C.G.B. and I. propose to make a Club tour of this event, leaving Whitehall Court at 12.30 p.m. on Friday, June 28th, for Leicester, via St. Albans, Dunstable, Hockcliffe, Newport Pagnell, Northampton, Market Harborough, and Leicester.

Truth and Motor-Cars.

Truth is very angry with the opposition still shown towards the motor-car in some quarters, and says:—"The blind, unreasoning aversion to motor-cars which is displayed by many of the County and District Councils would be amusing if it were not for the possibility that these bodies may succeed in seriously hampering a growing industry. . . . The motor-car is an innovation, and therefore they stupidly oppose it, just as their fathers and grandfathers opposed railways."

Troubles in Austria.

THE Statthalter of Lower Austria, in consequence of complaints of the police regarding the excessive speed of automobiles, has sent a letter to the Automobile Club of Austria requesting the officials to impress upon the members the necessity of avoiding an excessive speed. To this letter the Club has sent a long reply in which it is stated that it cannot be denied that certain automobilists drive very fast and lay themselves open to accidents. This is, however, the exception and not the rule. The greater number of prosecutions are, however, really due to the fact that the police authorities do not completely understand the automobile. An automobilist when driving at full speed can bring his vehicle to a standstill within two metres, and can therefore drive up to an obstacle without diminishing speed to any great extent. The great danger of a vehicle in the public streets does not lie in the speed at which it is driven, but in the difficulty of pulling it up. A carriage drawn by a horse driving at a slow rate of speed, but which can only be drawn up within seven metres, is much more dangerous than a fast travelling automobile, which can be brought to a standstill within two metres. The complaints against automobilists outside of the city have chiefly to do with the frightening of horses. In the country almost every driver goes to sleep, and in most cases so soundly that no signal made by the automobile is able to wake him. Consequently, no precaution taken by the automobilist can under these circumstances prevent the horse from shying. Then again, when the drivers go into a public-house they regard it as superfluous to look after their horses, with the result that when an automobile comes suddenly on the scene they are liable to bolt. At the conclusion of its

letter the Austrian Automobile Club expresses the opinion that the state of affairs at present is similar to that at the introduction of the bicycle, and that in a short time people and horses will get accustomed to the automobile as they did to the cycle.

The Brake Power of Motor-Cars.

A DEMONSTRATION of the great power of the brakes on motor-cars took place at Lincoln recently. Mr. Peel, the manager of the Lincoln Tramways Company, whilst riding, passed a motor-car, and on nearing the G.N. railway crossing gave way for a dray to turn into High Street. The horse Mr. Peel was riding slipped on the wet wood pavement and came down, the car, which had also turned away to give room for the dray, being close upon him. The driver of the motor-car at once applied the brake, and pulled up within about a foot of the fallen animal, and what might have been a very serious accident was thus averted.

"The Motor-Car Manual."

MR. MOFFAT FORD's useful little work, "The Motor-Car Manual," published by the Motor-Car Company, of 168, Shaftesbury Avenue, has now reached its third edition. It is just what it professes to be—"An introduction for the absolutely uninitiated to the whole subject of automobilism." To that large and growing section of the community now beginning to consider the question seriously, Mr. Ford's Manual is particularly suited, and will no doubt go far to turn many a waverer into a confirmed motorist. "How to Buy a Motor-Car" is the heading of the first of the five parts into which the work is divided, and the advice given therein is good. What is equally important to the possible purchaser is, that it is written in a manner intelligible even to the least mechanical mind. The same easy style marks subsequent chapters, of which "When a Motor Won't Work" is full of useful hints, not only for the novice, but also for the old hand. The law relating to motor-cars is fully explained, and that part of the work devoted to the earlier history of motoring is excellent reading.

Roads Improvement Association.

NOT content with the excellent work which it has done during the fourteen years of its existence, the Roads Improvement Association intends to bring pressure upon Parliament to amend the existing system of administration as at present applied to the roads throughout the country. Centralisation of responsibility is, in a word, what the Association aims at bringing about. The 20,000 miles of road possessed by our country, it is hoped, will shortly be taken out of the hands of the various Councils through whose administrations they run, and come under the control of a Government department. As a result of such an arrangement a standard type as regards width and some other important points might be expected, also economy to the ratepayer, the one department requiring a smaller plant for road making and maintenance than that collectively held by various Councils now responsible. From a patriotic standpoint the Roads Improvement Association is also doing good work. Wider and better roads are necessary for the purposes of national defence, and the absence of sufficient roads suitable for the movements of troops and the transport of stores has long been a cause of grave concern to military experts.

Ideas for Sale.

FINANCIAL as well as public interest in the automobile is steadily increasing; not only are companies being suggested for the development of public motor-car services, but enterprising gentlemen are coming forward with ideas for the flotation of such ventures. One such person has written one of our correspondents offering a plan for an automobile service in and around London—for a consideration—and all he wants is the necessary capital to be supplied to enable him to go forward with the notion. We would suggest our friend giving

his views to the world, for the general use of the industry, and not retain them to simmer in his own head till the man of means comes along.

Anti-Exercise.

THERE is one danger of the automobile to which attention is being drawn by some writers in journals dealing with country life and rustic pursuits. And that is the tendency of motor riding to destroy the desire for exercise which is encouraged by love of the horse. It is pointed out that horsemen are becoming content to sit behind a wheel and enjoy the fresh air of the country without the exhilarating use of the muscles which is associated with other outdoor pastimes. Of course, there is something in the objection—were it true that the automobile is destructive of that love of the horse which is inherent in an Englishman's nature. But the facts should not be distorted, and such far-fetched ideas should not be encouraged. The popularity of the automobile will not do away with horse-riding as a means of exercise; but it will bring into the open fresh air of the country many invalids and delicate persons whose health will not allow them violent pastime, but who will find in the calm enjoyment of a ride on a motor-car a source of health and a lengthener of their days.

MR. ROGER FULLER ON HIS 16 H.P. NAPIER CAR.

Doctors and Motor-Cars.

One of the most notable features in connection with the publicity accorded the Motor-Car Exhibition was the extent to which it was noticed by the medical Press. And what was even more satisfactory was the practically unanimous praise bestowed on motor-vehicles. "If the makers would but give us a reliable machine we would have no doubt about the motor-car being the best vehicle for the medical man." Such was the conclusion of more than one journal. Seeing that reliable vehicles are now numerous it is little wonder that in every London suburb doctors can now be found using automobiles in their practice, and recognising the suitability of such vehicles in no uncertain way.

Motor-Car Accidents.

Two years ago we could hardly take up a prominent newspaper without seeing some striking headlines concerning "motor-car accidents." Many of these "accidents" were merely commonplace incidents; a large number were trivial occurrences in which motor-cars played a very secondary part. It is very satisfactory to observe that pressmen are recognising the unfairness of putting every roadside mishap down to the discredit of the automobile, and it is gratifying to find that a car can be left by the pavement without so much general conclusion as to a break-down. These two tendencies are becoming more

and more noticeable, thus demonstrating the rapid education of the people, and leading us to hope that the period of prejudice is giving way to the time of universal popularity.

Too Much Light.

AMONG society people the grounds of objection to motor-cars are changing and we hear more said about the lamps employed on cars than the wickedness of the cars themselves. Everyone recognises that the automobile cannot be interfered with in day time, and so a criticism is now going the round of the Press directed against the use of large brilliant lamps on motor-cars. Some cars carry a great many lamps, and it is pointed out that the mail coach driver is prepared to go on his night journey with comparatively feeble lights; why then should motorists want four or five brilliant lamps to scare any nervous horses that are allowed out after dark? This is a question asked by the *Court Journal* in a very serious way. When will motorists satisfy everybody?

Back to the Land.

MR. RIDER HAGGARD, weary of South African romances, is now finding excitement in visiting agricultural districts and urging us to get "back to the land." Yes, we agree; and add the suggestion that the motor-car will prove an excellent means to that end. Just as light railways have been helpful to some Irish districts where ordinary locomotives would have been impossible, so will the motor-car enable small holders and market gardeners to get their produce rapidly and cheaply to the centres of consumption. This is a fact that should be brought prominently before the agricultural community who have long complained of the rapacity of railway companies and the present difficulties of transit. Nowadays land near railway stations always lets easier and at better rates than that far removed. But if each village had its own motor-car service this distinction would be removed, and the chances of successful and profitable cultivation would be generally extended.

Not on Piers.

HITHERTO pedestrians, bicyclists, and motorists have been allowed on the West Pier of Kingstown. Now—and the decision to enforce the rule was carried unanimously—the latter will have to leave their cars behind them when seeking the pleasures and delights of the pier. One gentleman declared that the motor-cars did more damage in one week than the bicycles did in a year, and not a single member of the Kingstown Urban Council had a good word for the cars. So they adopted the resolution unanimously, and adjourned immediately. No wonder!

A Time Table.

THERE is an excellent motor-car service between High Street, Hemel Hempstead, and Boxmoor station conducted by the Hemel Hempstead Motor Car Company, of which Mr. A. F. Pemsel is the secretary, and Mr. W. L. Wilson the engineer. The cars commence running from Hemel Hempstead at 7.30 a.m., and the last vehicle returns from Boxmoor at 9 p.m. meeting the most patronised trains throughout the day. If five seats are booked special trains are met. The fares are reasonable and the company is to be congratulated on its excellent time table.

What Can't be Cured.

No apology is surely needed for reverting to this subject, for the dust, under the present climatic conditions, is lying thicker on the roads than ever, and it is hardly to be hoped that any new vehicle will appear—unless it be Sir H. Maxim's aeroplane, brought up to date with "magnalium"—that can traverse the country without raising it. Even on American railways its effects are felt, and a method said to have been adopted

there was to water the track with petroleum—if such a Hibernicism be permissible—the effect of which was said to be satisfactory. Such a remedy is hardly applicable to highways, and, if it were, would probably be considered by the motophobes responsible (metaphorically *bien entendu*) for the dust agitation as worse than the disease. Seriously speaking, however, the most promising solution of the difficulty will probably lie in improved means for removing the dust. At present the scavenging of roads—where this is done—is usually accomplished when the dust is converted into mud, and under these conditions the removal of a ton of dust involves the transport of about a ton and a half of unnecessary water. If a suitable and economical machine, probably motor driven, could be devised for collecting and removing the abraded road-surface while in a dry state, the problem of good and clean roads would make a great step towards solution.

Round the World.

Two young men living at Alton, U.S.A., have announced their intention of circum-motoring the world. They propose to start in June next without a cent, and earn their expenses as they travel, by lecturing on American life and customs. England will be the first country visited, then they will go to France, across the Pyrenees to Spain, then back to Switzerland and Italy. From Rome they will cross the Mediterranean to the Barbary States, go thence to Egypt and up the Nile, then across the Mediterranean again to Greece, and then to the Holy Land. From there they hope to be able to push through overland to Hong-Kong. If they survive the trip through the hostile Chinese provinces they will visit the Philippines, and return home by way of Honolulu and San Francisco.

No Fear of Explosion.

THE idea once prevalent that steam-cars were liable to explode is itself exploded is the wise deduction of the *Court Journal*, otherwise the King, who is well advised on motoring, would not pin his faith to his sixty miles an hour Gardiner-Serpollet, as he does. The King has also, as everyone knows, a couple of petrol-driven Daimlers. The Queen prefers electricity as a motive power, so that as far as Royal patronage goes honours are equally divided amongst the three systems.

Motor-Car Construction in Australia.

WE learn that a fine 6 h.p. motor-vehicle has just been built in Melbourne, Australia, by Mr. Sutton, to the order of a gentleman in that city. The entire vehicle is of colonial construction. The car seats four people comfortably, and is planned to travel at a speed of fifteen to seventeen miles an hour over fair roads. The motor is driven by ordinary kerosene, and is claimed to leave no unpleasant smell when treated by the Sutton patent. An experimental tour is to be taken by the owner and designer at an early date throughout the Western District of the Colony. The body of the carriage is built on American lines, the wheels being fitted with 2½ inch pneumatic tires.

The Centre of Gravity.

OBSERVATION of motor-cars in various parts of the country shows that some builders are not adhering to strictly scientific principles. Reference is made to the practice of propping up vehicle bodies far above the frame. It is a matter of general mechanical knowledge that this principle, as applied to motor-cars, if carried to extremes, is incorrect and is evidently copied from the prevailing fashion of high horse carriages, which are built in that manner so as to permit of the occupants seeing over the horse. While this is by no means a general practice, it is well to take into consideration the fact that self-propelling vehicles, built to run at speeds ranging from 15 to 25 miles per hour, should have the bulk of the weight, and, consequently, the centre of gravity, as near the ground as possible.

The Paris-Bordeaux and Gordon-Bennett Cup Race.

"BY AUTOMAN."

THE A.C.F. might almost have been an English Club at the latter end of last week, and at the beginning of this one, as at every turn one recognised faces familiar to the motorists' happy hunting grounds at Whitehall Court. I met Mr. Alfred Harmsworth in the Rue de Rivoli driving his Panhard at a reasonable speed early on in the week. He came to Paris to take delivery of his new 12 h.p. Serpollet steam car, on which he drove out to Versailles and back for a trial trip. The car, which is painted dark green and upholstered in buff-coloured cloth, is a sort of landau, with four comfortable seats inside and two seats on the box. Only the back half of the carriage opens, the front half being a fixture on the top of which luggage can be carried. The carriage work has been carried out by Kellner in a luxurious style, and the vehicle is essentially intended for comfort and not for speed. Mr. Harmsworth left Paris on Sunday morning last for Bordeaux in his newly-purchased car, accompanied by Mr. Alfred Bird, of Birmingham. The

Tuesday was a busy day at the A.C.F., and brought another batch of members of the A.C.G.B.I. Mr. Fuller arrived on a De Dion voiturette and Mr. Howard on his 5 h.p. Marshall. Messrs. Farman, Worby Beaumont, Stead, Instone, and many other well-known automobilists were collected to watch the process of numbering and stamping the cars. Certainly, the Napier occupied the attention of everyone, whether English or French, more than any other car. It is a real giant alongside of the others, but it, nevertheless, glided smoothly into the Club *garage* without any jerk, and only the deep note of its powerful motors gave any indication of the bound forward it could make. The sound it makes is unmistakable, and I heard a well-known Franco-Swiss *chauffeur* tell how, whilst he was seated in a restaurant on Sunday night, he heard it coming, and exclaimed, "That is not a Panhard or a Mors; it is either a railway locomotive or the English Napier car arriving for the Gordon-Bennett Cup."

THE MOTOR MANUFACTURING CO.'S 20 H.P. RACER.

latter gentleman arrived in Paris on Wednesday last week, in his capacity of chairman of the A.C.G.B.I., and accompanied by Mr. Claude Johnson, with the object of finding a suitable *garage* for the English Gordon-Bennett cars. I noticed Messrs Bird and Johnson amongst the spectators at the entertainment given by the A.C.F. on Wednesday, the 22nd ult., in the very pretty bijou theatre attached to the Club's premises. The Napier car turned up during the early hours of Monday morning, and with it, or in its wake, Messrs. Napier, S. F. Edge, Mark Mayhew, Gregson, Jarrott, Cecil Edge, and Du Cros, jun. The Hon. C. S. Rolls was, of course, soon on the scene, but, as is most unusual with him, unaccompanied by a motor-car. Mr. Phillips arrived to complete the party, and several others whose faces I have seen in Whitehall Court, but whose names escape my memory. No great automobile event would be complete without the presence of Sir David Salomons, and when we all adjourned to the A.C.F. to lunch Sir David was at the head of the table.

The Napier car above mentioned was in reality the property of Mr. Rolls, but he cancelled the order last week on account of late delivery, judging that it would be unwise for him to run the car in the Cup Race before having had ample opportunity of testing its capabilities and powers of resistance. Mr. Mark Mayhew stepped in the breach and took over the car.

A good petrol story is connected with the arrival of Mr. Edge on Mr. Mark Mayhew's 70 h.p. Napier. The *New York Herald* of Monday morning came out with the news that Mr. Edge had lost his Napier car on Sunday. It seems that, said the writer, Mr. Edge had been for a trip in the Bois on Sunday and had sent his driver off with the car whilst he partook of lunch, giving the latter a rendezvous later on. The watchful police, however, had their eyes on him and locked him up, together with the car, for furious driving and also for not having a permit. However, on making anxious inquiries from Mr. Edge on Monday morning, I learned that, first, the car only arrived in Paris in the night between Sunday and Monday; secondly, that his driver was duly certificated; and thirdly, that the latter had never been allowed to drive the new car.

I had an opportunity of examining the car, thanks to the courtesy of its owner, maker, and pilot. The point that first strikes the casual observer is certainly the great engine power, suggested by the size of the bonnet, which is not flat like that of the Mercedes car, but sloping downwards away from the driver. It was easy to see that a great effort had been made to have the car ready in time for the race, and that it had not been possible to attend to small details and give it a finished appearance. Unfortunately, it was not able to compete for the Cup on account of the want of good covers for the back

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

ires. In accordance with the rules of the competition the whole car must be of British manufacture, and the Dunlop Company have not been able to produce a cover that will stand the strain of the fourth speed. The tread has been found to come off in sections, making it dangerous if not impossible to attain a high rate of speed with Dunlop covers. The problem of manufacturing racing tires is a difficult one to solve in England, for, although the Dunlop Company has made an effort in this case, it has been impossible to try the tires or experiment with them when once made. This, of course, on account of the speed regulations and restrictions. The owner of the car came therefore to the very sensible decision to run the car with Michelin tires in order to show its capabilities and to publicly declare a forfeit as regards the Gordon Bennett Cup, in order to allow of no misunderstanding.

Nothing could have been more perfect than the state of the weather and the condition of the roads for the greater part of the motor-car race held between Paris and Bordeaux on Wednesday last. A few slight showers of rain fell in Paris on Tuesday, and then the weather gradually cleared up, the night setting in with a clear sky. Paris had quite a preoccupied air, as if on the eve of a great event, and motor-cars scudding about the avenues and streets attracted quite an unusual amount of attention, the passers-by seeming to ask themselves, as they heard the familiar horn, "Is this one of the competing cars?" On the Place de la Concorde, outside the premises of the French Automobile Club, a crowd, made up mostly of *chauffeurs* of all nations, watched with interest the arrival of the competing cars, as they came forward one by one in order to be numbered and marked for the race. All kinds of rumours and counter-rumours were floating about with reference to the competitors for the Gordon-Bennett Cup, but they gradually crystallised down to the disappointing information that no other nation but France was in a position to come up to scratch, and that the cup would be competed for only by the firms Panhard and Levassor and Mors. The British car could not compete for want of tires.

The start from Suresnes should have taken place at 3.30 a.m., but really did not take place until three-quarters of an hour later, but in spite of the early hour crowds of spectators turned out and lined the roads for miles. Streams of cyclists, pedestrians, carriage people, and automobilists poured through the Bois de Boulogne all night long, and the trains to outlying townships on the line of route were all crowded. As far away as Chartres, 79 kilometres from Paris, I found it quite impossible to get a bed, and at the Hotel du Grand Monarque, the yards, stables, entrances, coachhouses, and the road in front were crowded with motor cars, more than forty of which had been turned away during the day.

I posted myself at the top of a hill two or three miles from Chartres on the road to Bordeaux and listened to the nightingale singing in the woods. Gradually the sun rose in a lovely sky, and the cuckoo made itself heard across the fields. Levegh was the first to turn up on a Mors running splendidly, followed by Girardot on a Panhard, and Voigt, also on a Panhard. Edge came next on Mark Mayhew's Napier, running very strong. I heard his engine steadily beating, and it gave me the impression that if the tires held good he should have a fair chance of success; he waved his hand in answer to my call as he went by. Hourgières came next on a Mors, and then followed two Panhards and a motor-tricycle, all in a bunch. Charron was ninth, his engine evidently giving trouble—I could only hear two cylinders working—Giraud, Andre Axt, Teste, Farman, and Pinson following. At Chateaudun Levegh still led, with Girardot second, at an interval of 11 min., and Fournier third, with Voigt right close up to him, and Farman 25 min. later. At Tours (220 kilometres) Fournier and Voigt had both got in front of Girardot, Farman still keeping his place. Levegh passed Sainte-Maure (255 kilometres) at 7.56, and then he seems to have dropped out of the race after this. At Ruffec (388 kilometres) Fournier was levelling with Voigt, Farman, Axt, Giraud, and Girardot following.

As I am writing the order of arrival at Bordeaux is just being chalked on the board of the A.C.F. as follows:—

	Arrived. p.m.	Average speed. Kilos. per hour.
Fournier	1.9	83.727
Farman	2.3	77.372
Voigt	2.8	71.3
Axt	2.41	66.666
Giraud	2.59	63.727
Pinson	3.6	66.806
Teste	3.13	64.765
Girardot	3.28	58.78
Hourgières	3.33	60.341
Osmond	3.39	64.503

Fournier's average speed works out to about eighty kilometres per hour. So far no accident has been reported. At about 3 p.m., torrents of rain came down, drenching those who had not already reached Bordeaux. The Napier car seems to have dropped back between Chartres and Tours, no doubt with tire troubles, and at the time of writing there is no news of its arrival in Bordeaux.

A disappointment at the start, the Gordon-Bennett Cup contest became an uninteresting event long before the end. Of the three French *chauffeurs*—M. Charron on a 40 h.p. Panhard, M. Levegh on a 48 h.p. Mors, M. Girardot on a 40 h.p. Panhard—who left Paris on Wednesday morning to compete for what was originally intended to be an international trophy, not one finished among the first seven of the racers on the road. The first car actually at Bordeaux was the powerful Mors driven by Fournier, who was not running in the Cup race, but in the Paris-Bordeaux competition. The winner arrived in a huge cloud of dust at 1 h. 9 min. 44 sec., having left Paris at twenty-five minutes past four in the morning, covering the total distance of 348 miles in 6 h. 7 min. 44 sec. net time, being an average speed of 56½ miles per hour.

The "net" times given represent the times taken from start to finish after a deduction of 2 h. 37 min. has been made for passing through the towns and villages, where the speed was restricted to 12 kilometres an hour. An hour later the second car came in. This was M. Farman's 35 h.p. Panhard, his time being 6 h. 37 min. 15 sec. net time, averaging 52½ miles an hour. M. Voigt's Panhard was third in 7 h. 12 min. 11 sec., averaging 48 1-3 miles an hour. Axt averaged 44 4-5, Giraud 43, and Pinson 39 9-10 miles per hour, all three being on Panhards. Five minutes later the first Cup entrant, Girardot, on his 40 h.p. Panhard, came in, having taken 8 h. 47 min. 59 sec., averaging 39½ miles. At 6.15 p.m. Wednesday no other Cup car had arrived, and there was no sign of the big Napier car, which was last heard of 220 miles from the start.

At Chateaudun, Charron had a collision with Levegh, and did injury to his pneumatic tires, which took him three-quarters of an hour to repair. Both, however, continued as far as Vendome, when Charron, recognising that his chances were hopeless, gave up.

This is the second Gordon-Bennett Cup race, and the fourth Paris-Bordeaux contest. Previous times have been: 1895, 22 h 25 min., Levassor, on a 4 h.p. car; 1898, 15 h. 15 min., Rene de Knyff, on a 6 h.p. vehicle; 1899, 11 h 43 min. Charron, on a 12 h.p. car. The first Cup contest took place on the Paris to Lyons road, 566 kilometres, or about 351 miles, Charron winning in 9 h. 9 min.

At the last moment, the Motor Manufacturing Company, Ltd., decided to withdraw from the Gordon-Bennett race the car built for the contest. Under date the 24th ult., the Company write us as follows:—"The principal reason for our doing so is the almost impossibility of obtaining the necessary trial run of at least a hundred miles over any roads within a convenient distance of our works. The car was on the road yesterday, but by reason of the horse-drawn traffic the driver was compelled to pull up continually, consequently subjecting the gear every few seconds to enormous strains. Moreover, such was the encumbered state of the road that he could not try the fourth speed at all." We give an illustration of the car herewith; it is fitted with four M.M.C. De Dion type engines, developing up to 30 h.p. The road wheels are shod with Collier twin pneumatic tires.

A RUN ACROSS FRANCE ON A RACER.

By A. R. SENNETT.

(Continued from page 219.)

THERE cannot, indeed, be a shadow of doubt that motoring is a health-imparting pastime. What a contrast to travelling by train! There it often happens that on emerging from a stuffy carriage, after a wearisome journey, one seeks for something to "tickle" one's carburettor—pardon, appetite. But your *chauffeur*, on descending from his "box"—pardon, *seige*—is in the mood to eat anything, if not everything that may be placed before him. In the good old coaching days, when St. Martin's-le-Grand was alive with fours-in-hand and eleven-mile-an-hour stage-coaches, there gazed down upon them a smiling face with enormous mouth, protruding in bas-relief from the grimy walls of the great coaching hostelry. This mouth surmounted the legend:—

Milo, the Cretonian,
An ox slew with his fist;
And eat it at one meal.
Ye Gods! What a glorious twist.

Perhaps a day will come when such another, but motor, hostelry shall rear itself at the Arthur Balfournian centre, and which shall bear this superscription:—

Rollo, the Chauffonian,
An ox slew upon the *piste*,
And eat it for his dinner—the sinner,
Dieu, motorists! What a glorious twist.

Perhaps that which is most intimately connected with the *chauffeur's* health is his clothing. At first sight this might appear a matter of small importance, but really it is one which may fairly command space for discussion by those actually conversant with motoring at high speeds. Already quite a small industry is springing up in fulfilment of the *chauffeur's* requirements. What these are is open to discussion, what he should not use is more obvious. He should certainly not don anything in the nature of a loose garment such as an overcoat or impermeable having a loose cape which may blow over the face and cause an accident. Besides, such loose things are very wasteful in buttons, for few will be left after the first 100 kilometres. The wind at sixty miles per hour—which we believe Jack calls a stiff gale—has to be experienced to be appreciated. It reminds us of that to which he referred when he said, "The wind it blow'd so 'tarnationally hard, it blow'd three teeth out o' the carpenter's saw and took six men to hold the cap'n's wig on." Trousers, too, are far from suitable nether garments, acting, in fact, as forced-draught pipes. We consider, then, that trousers should not be worn; nevertheless, it would be advisable to wear something in place of them. Laced boots also are unsuitable, and so is any form of headgear presenting a greater vertical surface than is absolutely necessary to the wind. Starched collars are unsuitable, and are also difficult to find at the end of a wet run, when they assume the appearance of a roll of brown linen round the lower part of the neck. The collar, however, will probably die hard, and we observe that some *chauffeurs* are taking to "spitters" as a compromise—i.e., celluloids, which may be expeditiously and economically washed, with a very small volume of water, *en route*. Celluloid—otherwise guncotton—should obviously be used sparingly; and certainly the transparent "celluloid" or "xylonite" guards intended as preservatives of ladies' complexions should not be had recourse to. Shirt cuffs should not be worn, for, like the Irishman's flea, when you go to put your hand upon them they're not there, you find only an accordion-pleated—accordin' to its fancy—tube of limpness. Moreover, *chauffeurs'* shirt cuffs become chameleons, for it is astonishing how marvellously they change colour after "visiting" the motor. The cuffs of coats also should be specially constructed to prevent the "weather" blowing up the arms. This can be done in two ways, by a buckle and strap at the wristbands, or by—and which is preferable—a false sleeve and strong elastic "gathering" worked in under the outer sleeve.

With regard to the material, we feel that the old English adage, "nothing like leather," applies perfectly in this case for

ordinary wear, whilst for cold and bad weather nothing can compare with Nature's own *vêtement*—viz., the skin with the fur left on; something with good long hair, such as bear or raccoon, which is capable of efficiently throwing off both dust and rain.

Were we asked our opinion of what the automobilist's costume should be, we should say that for ordinary driving, especially with ladies, it should be as nearly as possible that of a gentleman driving his carriage and pair. A well-appointed automobile never looks so well as when it is garnished with well-dressed women, its driver turned out in much the same "rig" as he would appear on the box of his four-in-hand. For high speed motoring, however, we consider that the best costume would consist of a *casquet*, a pilot jacket, and knickers, all in leather, and preferably of a lightish brown colour, which is cooler, and which will serve as a distinction between the *amateur* and paid *chauffeur*. The knickers should be provided with rather deep continuations and should be full at the bottom. The "get up" would be completed by top boots—probably brown in colour, of such height that they would come well up beneath the overlap of the knickers. Motor top boots should be made upon the "puttee" plan, that is to say, with a spirally-arranged strap, so that they may be made to fit tightly round the calf.

The *casquet* should be of dull leather with a wide enamelled peak, and it should not have holes in the front, as some have, through which the air rushes and balloons the crown. The strap should not be of enamelled or "patent" leather with sliders, as is usual, since these are quite useless, the slippery patent leather slackening, and causing many a well-meaning cap to lose its head. In place of the sliders a buckle should be used, and in order to allow for a certain amount of give-and-take, the straps should be fixed to the cap through the intervention of a short length of elastic material. It may be an advantage to be elevated at once to a Grand Duke, if not a Czar, by donning a *casquet* of beetling proportions; but the automobilist will find that size in this regard is a disadvantage. For bad weather we think there is nothing to supplant the long-tried Sou'-Wester, but this should not be of oilskin, as it takes too much room when stowed away. It should be of flexible mackintosh, helmet shaped, and we find an advantage in having the chin tapes stitched to the Sou'-Wester at the hem of the lining and not sewn on to the ear-guards; by this means the latter may be pushed up into the crown when not required, and one's hearing thus facilitated.

Concerning the waterproof, the best we have seen is made by Messrs. Ström et Fils, of Paris, and is fashioned much in the same way as a diver's dress with a neckpiece of thin sheet rubber which clings tightly round the neck in all positions and yet gives perfect freedom of movement. Of course with starched collars this ingenious contrivance is wasted, but a motorist's shirt should be of flannelette built upon the Continental cyclist's pattern, or pyjama, viz., with strings for fastening round the neck. This, combined with a soft comforter round which the coat can button firmly, constitutes a very good form of packing for the neck joint.

With regard to gloves, these require to be much stronger than those of the usual *dilettanti* type, and the most comfortable are those furnished with gauntlets. One other article of great utility, if not of attire, should be referred to, viz., the goggles. These should be carefully designed, and care should be taken to note that the valence is not so long that if it blow up over the glasses vision would be obscured, as this might lead to accident. Also this valence, which is intended to protect the face from the sun as well as from the impact of sharp particles, should be supplemented with a nose guard, for it is upon one's proboscis that "barking" takes place to the most annoying degree. The reminiscence of the red flag before one's eyes is sufficiently tantalising without one carrying a danger signal on one's very nose. We are very adverse to the use of goggles of thin glass, which we consider dangerous, from the fact that a small pebble may break them, possibly with serious result; therefore they should be of stout glass, and also decidedly convex, to prevent the eye-lashes bearing upon them. The best goggles we have seen are those made in Nice, now procurable from Messrs. Ström, as in these the glasses—of substantial thickness—are carried in conical

tubes and well away from the eye, whilst the bearing is taken around the eye upon a padding of soft material.

Racing, it has been truly observed, has improved both the breed of horses and the design of horseless vehicles. We know of nothing better calculated to impress one with the shortcomings of motor-vehicles, as well as to set one thinking on means of mitigation, than a run, at racing speed, over such a course as the Paris-Bordeaux. Just as it is in life that petty annoyances are those most keenly felt, so in motoring the petty defects are those which prove the most annoying. If one runs one's carriage against a tree and finds it *un peu plié*, one takes it into the nearest repairer's shop with the best grace one can command; but if an enjoyable run be suddenly put an end to by such a small thing as a short circuit, or a terminal which has become broken or unscrewed, or a petrol joint which cannot be kept tight by reason of its meagre proportions rendering it impossible to pack it efficiently, one is generally entitled to anathematise.

We had but two *contretemps*, the first due to a broken terminal, the second through forgetting to take in *essence*. With regard to the first, it is surprising that motor builders do not take the precaution, invariably followed by electricians, to convolute or "corkscrew" all leads near the terminals, which, by the way, are not terminals at all, but merely an ordinary quarter-inch iron nut and back-nut gripping a thin plate soldered to the end of the cable. It is much better to use a good substantial binding screw of gun metal provided with a steel set screw having a deep saw cut, suited to be tightened with a penny and provided with a winged lock nut. In the event of such a terminal failing, a convolution may be straightened out, a fresh end bored and gripped in the binding screw, without causing a minute's delay. A broken soldered joint is another matter.

With regard to running short of *essence*, this must have happened to many *chauffeurs*, and there would appear to be room for a simple and reliable indicator. We think that perhaps the most valuable type of such indicator, or annunciator, would be one that would ring an electric bell as soon as the *essence* fell short of a predetermined level. Motor vehicles of every kind should be supplied with ample reservoir capacity for the required fuel, and one does not find much ingenuity being displayed by the ordinary builder—except in the case of racing cars—in utilising the utmost available space for this "essential" purpose, with the result that one frequently encounters equipages on the road hung about with tin cans and *bidons*, like a nomadic, peripatetic, travelling van. No matter what storage may be provided, however, one is apt to *manquer de l'essence*, if one is to rely on one reservoir only, and therefore we strongly recommend that every carriage should carry an auxiliary reservoir sufficient to serve for a short run in the event of the main reservoir giving out; but it should not be connected to the main reservoir, and thus made liable to be emptied at the same time. Speaking of benzoline, one cannot but feel that its dangers have been much exaggerated with us, for in France the requirements of the "motor-horse" are largely ministered to by women and girls, who think little of feeding them with three *bidons* gurgling simultaneously.

Other annoying delays are frequently caused by the loosening of nuts which are not provided with back-nuts. The land yacht designer suffers as much from the depredations due to vibration as does the naval architect, and more so. The timber walls of "Old England" would not have remained taut and staunch as they did had they been placed at the mercy of the pulsations of 10,000 h.p. motors. We cannot too strongly impress the necessity of well-fitting threads and plenty of lock nuts. Something better than the ordinary "union" for pipes—especially steam and *essence* pipes—is wanted. Another point, which was forcibly brought to one's mind after a few *caniveaux* experiences, is the advisability of providing the springs of high speed carriages with some kind of "dash-pot" action. We are inclined to think also that the ratio of the angular displacement of the steering wheel and that of the road wheels is too great, so that at the maximum speed the steering is rather too sensitive, whilst the effect of back lash is exaggerated.

(To be continued.)

GOSSIP FROM PARIS.

(From an Occasional Correspondent.)

NEVER have I seen Charron's in such a state of bustling activity as on Tuesday last. Every visitor to Paris interested in automobilism had a look in there during the day, and this invasion did not tend to simplify the work of the staff, who hardly knew which way to turn. English enthusiasts were in great force, and I noted among others Lord Carnarvon and Mr. Worby Beaumont, while America was represented by the famous Tod Sloan.

DURING Whitsuntide the *agents cyclistes* of Paris were more energetic than ever, and many indeed were the *contraventions* issued against unfortunate motor-men. At least one English visitor—I'll mention no names—was included in this list, and on Saturday evening I saw no less than four cars pulled up between the station at Passy and the Trocadero. I would be one of the first to admit that Monsieur Lépine's brigades have done good work in the French capital, but I do think that their zeal is occasionally exaggerated, and that the motorist is sometimes made to suffer needlessly. One dare hardly drive at all in Paris during one of these periods of police energy, for nothing fitted with a motor is then spared by the brave *agent*. The Bois, the Avenue de la Grande Armée, and the hill at Suresnes are greatly favoured as hunting grounds, but now and again the scene of operations is suddenly shifted to, perhaps, the Bois de Vincennes, situated on the opposite side of Paris, and then woe betide the *chauffeurs* of eastern Paris! So, visitors in particular, *gare aux agents*, and be sure to have all your papers with you.

ONE of the recently-elected members to the Automobile Club of Great Britain, Mr. W. S. M. Burns, was to be seen driving about Paris last week in his new 8 h.p. Panhard, one of the smartest cars turned out by the famous carriage-builders, Messrs. Binder.

THE new Panhard racers give one rather the impression that the motor is tilted up, and that the car sets down at the back. This does not tend to improve the appearance of the car, but one overlooks that in admiring the magnificent lines of the vehicle, which bespeak both strength and speed. I was informed in the A.C.F. garage that some little trouble had been experienced with the clutch, so Napier's are not the only constructors who find this part of a big car a source of anxiety.

ALTHOUGH the majority of English automobilists journeyed to Paris to witness the big race by the Dover or Folkestone routes, still Newhaven was not neglected, and on Friday evening five enthusiasts, at any rate, crossed to Dieppe. These were Messrs. Du Cros and Jarrott, who had already sent on the former's Panhard by the goods steamer, Mr. E. M. C. Instone, and Messrs. Leonard and Wagner. One talked "motor" on board that night.

THE International Motor-Car Exhibition organised by the Austrian Automobile Club opened in Vienna on the 25th ult., and will run to June 6th.

THE Enniscrone and Ballina Motor-Car Company, Ltd., has been registered in Dublin with a capital of £3,000, to work a motor-car service between Ballina and Enniscrone.

MR. A. R. SHATTUCK, the president of the Automobile Club of America, intends touring in Europe during the next three months with a party of French friends, and has ordered a 12 h.p. automobile in Paris, to be ready on his arrival in that city some time this month.

THE Mo Car Syndicate Company, whose extensive works in Camlachie, Glasgow, were destroyed by fire recently, have just taken over the old Underwood Thread Mills, Paisley, recently vacated by Coats, Limited, and will start work in them as soon as possible. Already a portion of motor-car plant has been fixed, and work will commence next week, when some 500 men will be employed.

CORRESPONDENCE.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your experienced readers be so good as to inform me whether motor-bicycles are liable to be taxed? The local inland revenue officer here has demanded 15s. tax. There is a doubt as to the legitimate levy of such a tax. The cycle is used for trade purposes.—Yours truly,
W. S. L.

THE DE DION VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be greatly obliged if some of your readers could give me information respecting the $3\frac{1}{2}$ h.p. De Dion voiturette (not Cudell), as I am thinking of going in for one, last year's make, and nearly new. I should like to know if they are reliable and give satisfaction, and if they will carry more than two or even three persons up most hills with ease. In most cases, however, there would only be one person (the driver) using the car.—Yours truly,
N. VOICE.

HELPING THE FIREMEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Happening to pass through Kingston on Thursday night, the 16th ult., on my tricycle with trailer, accompanied by a friend on another motor-tricycle, we came up with an excited throng of people hurrying to a fire. Amongst them I was surprised to see a couple of fireman trotting along on foot to the scene of conflagration. Much to the delight of a big crowd I offered a seat in the trailer to fireman No. 1, whilst fireman No. 2 was accommodated by my friend with a "stand" on his axle. Using plenty of gas and advance sparking we soon touched the legal limit, with the result that our friends of the bright helmets were able to put in some useful work at the fire much sooner than they otherwise would have done.—Your truly,
A. G. J.

RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Cobb's letter in the last issue, I certainly was not aware that the Serpollet car was "left" on the hills, and I am obliged to him for pointing out the fact. I should feel equally obliged to him for pointing out anything else in connection with the Serpollet car which might be of interest. In reference to his remarks *re* Daimler motor and Panhard gear, he is, as he suspects, mistaken in my identity; I have not and do not intend to make any disparaging remarks about the work of men who have spent years of their life and enormous sums of money in developing a great industry. I merely wish to discuss the matter in a perfectly friendly way, because the subject is an interesting one, and I think that the steam-car, if suitably designed, is capable of developing more power for weight, and consequently speed, than is possible with an explosion motor-car; that is, with existing state of knowledge.

It is quite possible that in years to come someone will perfect an explosion motor which can be started, stopped, controlled, etc., just as easy as a steam-engine; but until that is done, some form of transmission gearing will have to be used. I should be very pleased indeed to go over Messrs. Napier's works as Mr. Cobb suggests, and will take the earliest opportunity of doing so, for I consider they are a most enterprising firm.—Yours truly,
STEAM.

BELT TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If your correspondent R. E. L. will try Dicks' belt I should think his troubles should end. I bought one of these about two months ago—2 in. 11 ft.—for my voiturette after

endless trouble with leather belting of all sorts, as in wet weather my belt gets more than its share of wet and mud. I have not had to touch the Dicks since I fitted it, and I find mud and water have not the slightest effect. I now drive in all weathers, thanks to this belt, and have not the least trouble in this direction; my car has neither jockey pulley, loose pulley, nor belt tightener, and the latter does not seem at all necessary. I took a fancy to the Teon belt (similar to Dicks'), but as the latter shows no signs of giving out I have not had an opportunity of testing it yet. It has the appearance of being an improvement even on Dicks', being copper-sewn, water, acid, and heat proof. They have also some good fasteners, that I am using with satisfaction, these being a stamped steel affair, with two rows of long teeth. I don't know their name, but they are satisfactory.—Yours truly,
A. E. J. STEELE.

GREASE CUPS WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you, or any of your readers, inform us where we can obtain grease cups marked "Patent Centre Screw, London"? We experience great difficulty from the constant loss of the ordinary pattern screw caps on our public service cars.—Yours truly,
THE P. AND W. COMPANY.

WET AND DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers be good enough to give me their opinion of the relative merits of wet and dry batteries for ignition purposes of a $2\frac{3}{4}$ h.p. De Dion trike? I am using the latter, but they appear to run down quickly. It seems a great advantage to be able to recharge by the roadside if there are no corresponding disadvantages.—Yours truly,
W. T. FOSTER.

THE motor-car service between Chester and Farndon, started by Messrs. Watson and Company, of Liverpool, is, we hear, proving very successful.

THE Coventry Components, Limited, of Parkside, Coventry, whose 1901 catalogue has reached us, display, amongst other things, motor mud-guards and rims which should interest the trade.

MR. A. E. MAJOR, of Reading, informs us that he has just taken over the premises No. 30, Broad Street, in that town, as well as his present dépôt (No. 29), and when the necessary alterations are made he will have a *garage* for twenty cars in the main street of the town.

THE Roubeau carburettor, illustrated and described in these columns about three months ago, is being introduced into this country by Mr. Van Raden, of 7, Ellys Road, Coventry. The apparatus is nominally suitable for three-horse power motors, but a larger size is made for six-horse power engines.

MESSRS. MANN AND OVERTON have opened a dépôt at 25, Mortimer Street, Regent Street, W., where they will carry on business as consulting and practical engineers. They are prepared to store and repair cars of all descriptions, and to give advice to intending purchasers. Messrs. Marshall have also placed their sole agency for the Marshall cars in the South of England in Messrs. Mann and Overton's hands.

WHAT is claimed to be the largest motor-*garage* in the world has recently been opened by the City and Suburban Electric Carriage Company, at 6, Denman Street, Piccadilly Circus, London, W., for the convenience of the owners of vehicles supplied by the company. Here, for an annual, quarterly, or monthly fee, the motor-car can be insured, housed, cleaned, and kept in repair, ready to take the road at any hour of the day or night. The building, which has a total area of 19,000 square feet, consists of seven floors, served by an electric elevator, capable of raising vehicles of three tons weight to the top floor.

FROM HERNE BAY TO CHATHAM AND CHATHAM TO MARGATE.

THURSDAY, April 18th, was the day I chose to run over to Chatham with my brother. The weather was glorious and the roads perfect. We started from Herne Bay about 9 o'clock, and after a little winding about Herne Bay to get on the Canterbury road, owing to some roads being "up," we got fairly started. The car I was driving was a two-seated Pieper voiturette, and a nicer little car of the kind could not be imagined. The low-speed was only used twice on the way to Canterbury. I can assure your readers that the hill-climbing capacities of this car are phenomenal. We duly reached Canterbury, where very slow travelling was the order of the day. One would think that the inhabitants of Canterbury had never set eyes on a motor-car before, and we were held up whilst numerous people ran to hold horses, which would probably have behaved more quietly if they had not. Once clear of Canterbury, a little speed could be indulged in, and the little Pieper ran very well up to the legal limit down hill and on the level. The running was uninterrupted (except for horses) for some time.

Now I am about it, I should like to say a few words regarding horses and their drivers. The majority of drivers pull at the reins in an excited manner and alarm the horses, which other-

wise would have been perfectly quiet; drivers, too, have a habit of stopping one up a hill, and then they never think of saying, "Thank you." To continue, all went well till within about two miles of Boughton, when a leak was sprung in the petrol tank. We stopped, and thinking the leak was at the edge of the tank, tried to temporarily repair with halfpenny stamps; our efforts, however, were unavailing, so we ran on, as we had plenty of petrol, to Boughton, where we removed the tank and had it soldered up at a cycle shop. The leak was at the joint of the supply pipe to the tank, and it seems to me that a petrol tank would be a far better job if joints, etc., were riveted. We were delayed over an hour at Boughton, and we proceeded thence at about a quarter to twelve. We took in some motor spirit at Ospringe, anticipating further leakages, and ran on without a stop to Gillingham. Here we found some stones extending for about forty yards, so we both alighted and allowed the car to run by itself over the flints. A short run then took us to the top of Chatham Hill, which had to be descended with caution. We then ran along the New Road and duly reached our destination.

After lunch, a friend volunteered to show us the points of interest of Chatham, so, with three aboard, we threaded our way through the narrow streets of Chatham. I feel quite confident that it will require a very steep hill to stop the Pieper car; the hills it took us three up were awful. We started back from Chatham at about four o'clock, and the first event of interest was scaling Chatham Hill, which was done easily with reserve

power. We had a glorious run back, the only stoppages being (i) a blown-off hat; (ii) returning a petrol can; (iii) restive horse. Boughton Hill is a stiff ascent, and we were told that "that thing would never get up." "That thing," however, did get up, and very easily too, and we then ran straight on to Margate, where we arrived at seven o'clock.

I think that is very fair running, considering the hills. A word about the car. I think that, for a two-seated, easily managed car, and a good hill-climber, the Pieper voiturette cannot be beaten.

R. A. COBB.

THE AUTOMOBILE CLUB'S WHITSUNTIDE TOUR.

AMORE delightful centre than Oxford it would be hard to find for touring purposes, particularly at this time of year. Nevertheless no special effort appears to have been put forth to make the home Whitsun Tour of the Automobile Club a particular success, in consequence, no doubt, of the superior attractions of the trip to Paris, with a view to witnessing the start of the race for the International or Gordon-Bennett Cup. The Clarendon Hotel, of Oxford, was the appointed rendezvous for those participating in the English tour, but the muster was a very different one from that which made the ancient city of Salisbury so unusually active at Easter. Mr. Noel B. Kenealey and brother turned up on the 10 h.p. Delahaye in which they take such pride, and on Sunday ran out to Stratford-on-Avon, Warwick and Banbury, in very good time; in fact, Messrs. Kenealey consider the car to be quite as speedy as a 12 h.p. Panhard. Mr. J. M. Gorham drove his De Dion voiturette, on which he had the misfortune at Easter to sustain an awkward side-slip, by which the front axle was buckled to a very serious and apparently incurable degree. Very careful handling on the part of a skilled repairer, however, had resulted in a restoration of the axle to its former efficiency, and Mr. Gorham now reported the car to be "going beautifully," and appeared to be delighted with his automobile experiences since he took his first journey no further back than Easter.

Other visitors were Mr. W. D. Astell and Mr. C. L. Freeston on the former's 7 h.p. gear-driven New Orleans, a car which is now performing more consistently than ever. It has settled itself down nicely and is extraordinarily quiet, and as the third speed has been raised somewhat, it is now even faster on the level than before, and reels off miles in excellent style. It took the hills on the stiff route between Henley and Oxford in masterly fashion, on the outward and home journey alike, and at no time required the least attention on the road. There were also Mr. Hancock and friend, bound for Worcester, on a 3½ h.p. New Orleans; Mr. Swinton on the motor-bicycle, which he had at Salisbury at Easter; and Mr. and Mrs. Mulliner, of Northampton, on a Daimler. This last-named car was one of the earliest to be turned out from the works of the Daimler Motor Company's works at Coventry, and is still running in reliable and satisfactory style.

These were all the cars that were stabled at the Clarendon, but on Sunday Mr. Gretton was observed in the neighbourhood of Oxford, driving a party in a large Motor Manufacturing Company's carriage. Mr. Frank Butler and Miss Butler, with their Renault, and Mr. T. B. Browne with his 6 h.p. Panhard, were encountered at Henley, where they were enjoying a riverside holiday. The weather was simply glorious throughout, and the roads for the most part in grand condition, the rain which fell after Saturday midnight having helped to lay the dust. Everywhere the countryside looked charming, and the number of lilacs and wisterias in full bloom was astonishing. A considerable array of motor-cars of one type or another was encountered on the line of route, and are now such an accepted feature of road locomotion that they almost escape comment, while as for horses not a single instance was observed of an animal being frightened at the approach or passing of a car. For all who took part in the tour the holiday was as enjoyable as it could possibly have been, and it is only to be regretted that more members did not foregather at one central spot to "talk petrol" instead of "ganging their ain gait" in isolated directions.

THE Motor-Car Exhibition at the Agricultural Hall.

(Continued from page 235.)

Photo by]

A VIEW OF THE MINOR HALL.

[Argent Archer.

THE Consolidated Engineering Company, Limited, Gotha Ironworks, Slough, exhibited the Briton Coil clutches for motor-car work. The principle of the clutch is well indicated by its name. The power is transmitted from a box to a shaft, passing through it by means of a spiral band, one end of which is locked to the box, the other end being adapted to be rotated relatively to the box by a sliding sleeve, having helical projections, engaging in the interior of a second sleeve, the exterior of which has longitudinal projections engaging in the box. When the second sleeve is moved laterally the coil is gradually contracted on to the shaft of the grip, a certain amount of movement of the second sleeve ensuring an absolute grip of the box on the spindle. Unlike most devices for the same purpose, free lubrication of the engaging surfaces is harmless, the outer case of the clutch having been designed to form an oil bath, in which all working parts are contained. The coil is of best mild steel accurately proportioned for its work, and the drum on which the coil is made to grip is of hardened steel, ground to an absolutely true surface. The clutch exhibited weighed 5 lbs., was $3\frac{1}{2}$ in. in diameter, and was proportioned so as to transmit 16 h.p. at a speed of 1,200 revolutions per minute. Other sizes are, of course, made, and we were informed that a Coil Clutch has been supplied for use on one of the 50 h.p. Napier cars.

The Motor Fittings and Engineering Company, of Brighton, had on view a set of the fittings they are supplying to the trade to build up cars on Darracq lines. In addition to the foregoing, the component parts for motor tricycles and quads, as also a new three-speed and reverse gear box, were also staged.

The "Ideal" Storage Battery Company, of 5, Chapel Place, Long Acre, London, W.C., for which Messrs. Shippey Brothers, Ltd., are sole selling agents, showed their "Ideal" accumulator for motor car propulsion. They are put up in sets of 70, 90, 120, and 140-ampere hour capacities, and 100 and 200-volt

charging circuits. The feature of the "Ideal" battery is the use of an expansion plate by means of which the cells are claimed to be able to withstand a heavy discharge rate without depreciation. A special light-weight set of accumulators is made by the firm for sparking coils, while an 8-volt set was shown specially adapted for the lighting of motor and other carriages.

It is just about a year since the "Still" system of electric vehicles was introduced into this country. This type of vehicle has apparently been meeting with a demand in this country, for Mr. Still is still on this side of the Atlantic. His company—the Canadian Electric Vehicle Company, of 13 and 14, King Street, Cheapside, London, E.C.—had the largest display of electrical cars in the Exhibition. First, we noticed a "Doctor's Runabout," a three-wheel vehicle, for two or three persons. It is described as being a good hill climber, and is propelled by a specially wound "Still" motor. The battery consists of forty "Ideal" accumulators, having a capacity of thirty miles on one charge. The frame is of tubular construction, steering being effected by a lever at the side acting on the single rear wheel. The controller, which is at the driver's right hand, is adapted to give four speeds forward—three, six, nine, and twelve miles per hour—and reverse motion. The car, which is fitted with cycle-type wheels and solid rubber tires, weighs complete about 6 cwt. A neat-looking vehicle—although built somewhat higher than we are accustomed to—is the Dundee four-seated sporting dogcart. (Fig. 1.) This is fitted with a 6 h.p. duplex electro-motor, driving each of the rear wheels separately by chain gear. The car is furnished with a battery of forty "Ideal" cells. The controller, which is located at the right-hand side of the car, is adapted for six speeds forward and reverse. The battery will run the car a distance of forty miles on one charge, and we are informed that the vehicle has successfully mounted all the steepest hills in the neighbourhood of London, including Netherall Gardens, which is a grade of about 1 in 5,

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

this being the first electric car to ascend that hill. The "Oxford" electric phaeton was also to be seen. This vehicle, which has already been illustrated in the *Journal*, is fitted with a 4 h.p. Still motor. The latter is constructed to stand a much greater over-load, and will give a pull of 6 h.p. for hill work. One charge of the battery is equal to a forty miles run. The

FIG. 1.—THE DUNDEE SPORTING DOG CART.

controller is adapted to give six speeds. A car specially designed for town work was to be seen in a phaeton accommodating three or four persons. Fitted with a 5 h.p. motor and a battery of "Ideal" accumulators, a distance of from thirty to forty miles can be covered on one charge. An interesting vehicle was a victoria (Fig. 2) to carry three persons in addition to the driver and footman. The electrical part of the carriage is on the Still system, while current is supplied by a battery of "Ideal" accumulators carried in a compartment at the rear, and having a capacity of forty miles on one charge. Rubber-tired wooden

FIG. 2.—THE "ALEXANDRA" VICTORIA.

wheels and tiller steering are fitted, the carriage work, by Messrs. Morgan and Co., being particularly comfortable. In addition to a number of illustrations of different designs of electrical cars, samples of the Still 3 h.p. electric motor, with special winding for hill climbing work, and of the Still six-speed controller were also to be seen at this stand.

The principal feature of the stand of Messrs. Shippey Brothers, Limited, 13 and 14, King Street, Cheapside, London, E.C., was an express parcels van, of which twenty others are being manufactured by the Motor Traction Company, Ltd., for the Electric Parcels Delivery Company now in course of formation. These cars are specially suited for the delivery

FIG. 3.—THE ELECTRIC PARCELS DELIVERY VAN.

of light goods; they are constructed to carry 600 lbs. weight of parcels, are provided with two brakes, and speeded for three, six, and nine miles an hour. They are equipped with a battery of "Ideal" accumulators permitting a distance of about thirty miles to be covered on one charge. The car on view was nicely finished in lake, and apart from its electrical qualities is a good example of the art of van building, as may be gathered from our illustration (Fig. 3). The electric motor is geared by chains to the rear axle, two brakes being provided. Messrs. Shippey also had on view several light.

FIG. 4.—THE "IDEAL" STEAM CAR.

American-built steam vehicles. Fig. 4 shows the new "Ideal" runabout type as made by the Milwaukee Automobile Company. The boiler in this car is made of seamless steel. It is 16½ in. outside diameter, 14 in. high, and contains 350 half-inch copper fire tubes, giving approximately 50 square feet of heating surface. It is fitted with safety valve and a fusible plug placed on the

crown sheet. The latter melts out in case the water level falls below a certain point and extinguishes the fire. A $\frac{1}{4}$ -inch blow-off valve is provided, and this has a straight connection, draining the boiler of all impurities. It is pointed out that the only riveting on the Milwaukee boiler is the boiler head, which is not in contact with fire or water. The safety valve opens when

FIG. 5.—THE READING STEAM CAR.

a pressure of 225 lbs. per square inch is attained, blows off a few pounds, and then closes. Steam can be generated in four minutes, 150 lbs. pressure being obtained from cold water in ten minutes. A steam gauge is provided, registering to 300 lbs., fastened to the right-hand side of the dash, and the water glass is placed on the same side of the body, indicating height of water in the boiler, reflected by a mirror placed on the dash. In case of breakage, a new glass can readily be substituted by shutting off connections to the boiler during the operation, with globe valves provided for the purpose. A water glass is fastened under the seat, on left side of the carriage, showing the height of water in the reservoir tank. Secured to the bottom of the boiler, and easily removable for cleaning, is the burner; it is constructed of seamless steel. The petrol which serves for fuel is under air pressure, and is forced through the vaporising system and the atomiser, there mixing with the proper amount of air for perfect combustion in an intense blue flame. It is claimed that by carrying the vaporising system through the boiler, the fire can be relighted when the steam pressure is 50 lbs. or over. An independent valve is fitted, supplying gas to a pilot light, by which device the carriage can stand idle indefinitely, working steam pressure being meanwhile continued after shutting off the main flame. The fuel can be immediately shut off, and the fire extinguished even when the carriage is under full motion, by simply closing a valve operated from the driver's seat. Connected with the atomising valve is a regulator of special construction, by which the fire is regulated by the steam pressure to any heat desired. The top of the boiler is covered with a sheet iron hood which conducts any heat or smoke down through the exhaust pipe. The boiler, burner, and hood are all covered with plastic asbestos. The bottom of the burner is covered with a brass gauze netting, protecting the flame from any under currents of air, and preventing lighting back. The engine is vertical, direct acting, reversible, with two cylinders $2\frac{1}{2}$ in. diameter, having a stroke of $3\frac{1}{2}$ in. When running in 450 revolutions per minute it will develop about 5 h.p. The valves are operated by link motion, enabling the operator to take any speed desired, forward or backward, up to thirty miles an hour. The exhaust steam is passed through a muffler, so that the working of the engine is noiseless. A double-seated throttle valve is provided, by which steam can be admitted to the engine in very small quantity, under the highest pressure, for warming up the cylinders and starting. Arrangements are also made whereby, when the carriage is idle, the steam may be entirely locked out of the steam chest, so that no movement of the steam lever,

intentional or otherwise, will move the carriage. A direct acting pump of large capacity, working at all times when the carriage is running, and amply supplying the boiler, is driven off the crosshead of the engine. The water reservoir, in the back of the carriage, and extending half around the rear of the boiler, is made of corrugated copper, with compartments preventing violent movement of the water while the carriage is in motion; its capacity is 21 gallons. The petrol is contained in a seamless steel tank under the foot-board, and holds six gallons, which is said to be sufficient for sixty miles of travel over ordinary roads. It is forced under compressed air through the boiler, where it is vaporised, and thence to the burner, where it is ignited. The compressed air is stored in a seamless steel tank of large capacity, and a gauge, placed at the left side of the dash, shows the pressure at all times. The engine transmits its motion by a chain to the rear axle. Cycle type wheels, 28 in. diameter, and $3\frac{1}{2}$ in. pneumatic tires are fitted, while the steering is controlled by a tiller. The body is suspended on three springs—one at the front and two at the rear. Other exhibits on Messrs. Shippey's stand were an American water motor and 6-volt shunt dynamo combination plant for charging spark coil batteries from the house water tap at 40 lb. pressure; specimens of Gordon's patent copper oxide batteries with sodium solution specially suited for charging 4-volt spark coil batteries, and specimens of the new "Cyclone" electric ventilating fan sets.

Among the novelties in the way of steam-cars was the Reading (Fig. 5), made by the Steam-Vehicle Company of America, of New York, and introduced into this country by Mr. John L. Sardy, of Saracen Chambers, Snow Hill, London, E.C. The boiler (Fig. 6) is constructed of seamless steel, and is 16 in. in diameter by 14 in. high, the bottom sheet or head being rivetted on. It has 418 $\frac{3}{4}$ in. tubes and 60 sq. ft. of heating surface. A fusible plug, 2 in. from the bottom, prevents the boiler from being burnt in case the feed is neglected. The fusing of the plug extinguishes the fire. The plug, by means of a simple device, can, however, be immediately repaired, enabling the operator to continue on his journey. Petrol is used to fire the boiler. From the fuel tank the petrol is carried to the top of the boiler down through one of the boiler tubes, and then through a loop of heavy tubing to the burner.

FIG. 6.—UNDER VIEW OF READING BOILER.

To start the latter, a little alcohol is poured into a pan, where it heats the coil of fine tube above it. When this is hot, the main burner supply being still shut off by the valve, a separate valve is opened, and petrol admitted in small quantity to the burner. The moderate flame thus given, playing on the fire coil, soon heats the latter, and, by the time the alcohol is burnt out, the second valve can be closed and the main valve slowly opened.

The burner is a shallow drum pierced with air tubes, each of which is surrounded by pin holes in the upper head for the escape of the vapour. The working steam pressure ranges from 140lbs. to 150lbs. per square inch. At a pressure of 180lbs. the fire is automatically lowered. Both boiler and engine are hung from transverse angle irons, and an expansion joint in the steam pipe permits the engine to swing slightly in tightening the chain. No muffler is used, the exhaust steam being carried over the boiler and discharged downward between that and the tank through ten small pipes. A small pilot light permits the main burner to be turned off by the valve when the carriage is left standing. This keeps the boiler hot, and also the fire coil, so that the burner will start at once; while as the pilot flame does not play directly on the fire coil it does not tend to carbonise the vapour therein. The tube of the fire coil is very thick, and contains no gauze. In case liquid petrol should be let into the burner, it drains out

FIG. 7.—THE READING STEAM ENGINE.

by a mixing tube, which is set sloping for that purpose. The engine, which is the most characteristic feature of the vehicle, is shown in Fig. 7. It has four single-acting cylinders, $2\frac{1}{2}$ in. bore by $3\frac{1}{2}$ in. stroke, with trunk pistons, similar to those of gas engines. The connecting rods work in pairs on two crank shafts, and each of these shafts carries a steel pinion meshing with a similar pinion on a sprocket shaft below and between the crank shafts. The cranks are all 90 deg., so that the sprocket shaft gets a fresh impulse at every quarter turn. Instead of slide or poppet valves, a single rotary disc valve in the top of the engine distributes steam to all the cylinders. The lower part of the valve flares out, and its periphery is deeply notched by three ports, through which the steam, entering on the top of the valve by a pipe has access successively to four ports which communicate with the four cylinders. The bottom of the valve disc is recessed with three exhaust ports between the steam ports, and all of these connect with a central recess in the disc, by which the exhaust steam escapes to a cored passage between the cylinders and so passes out by a pipe. The valve is driven by the bevel and spur gears shewn, and makes one revolution to three of the crank or sprocket shafts. Fig. 8, shows the arrangement in plan and explains how the three sets of ports in the valve serve four cylinders. The heavy lines show the cylinder ports (a), the light lines the valve steam ports (b), and the dotted lines the exhaust ports (c), and connecting recess in the valve. The action of the valve is as follows: Presume that cylinder 1 is just taking steam, and that the crank of cylinder 2 is 90 deg. behind that of cylinder 1. In

this case the valve will rotate one-third of 90 deg. (equals 30 deg.) while the crank is moving 90 deg., and as the arc between the valve ports is 120 deg., equals 90 deg. plus 30 deg., it follows that the valve rotating in the direction shown by arrows will admit steam to cylinder 2 when the crankshaft has advanced 90 deg. from the position shown. This being done, cylinders 3 and 4 are served in like manner. The cylinder and valve steam ports are made of such width that steam is cut off at $\frac{3}{4}$ ths stroke. In order to reverse the engine, an ingenious and simple method of rotating the valve forward through an angle equal to the sum of the steam ports is adopted, and this admits steam to the cylinders of the exhausting pistons just before they reach the top of their strokes, and so the engine is caused to drive the reverse way. With this arrangement, by means of a clever but simple combination, one lever is made to suffice for both throttle and reverse. The throttle is closed while the lever, in mid-position, is reversing the valve, and it opens when the lever is moved forward or back. Except for the burner regulator no "automatics" are employed in the Reading car. Instead of using a by-pass valve, a check valve between the water-tank and the pump is arranged to be held open when desired. An auxiliary hand pump is provided, while the gauge cocks are tapped directly into the boiler instead of into a water column. Loss of steam by breakage of the gauge glass is prevented by the usual check valves, and hand valves shut off steam from these when the glass is to be replaced, thus allowing them to unseat. A double-acting brake is fitted. Special attention has been paid to flexibility of the under-frame which, while quite rigid against lateral movements of the axles, permits them to oscillate in vertical planes very freely. The rear end of the body is hung on two transverse semi-elliptic springs, with the rear axle frame between them; and this necessitates a pair of light stay rods from the rear axle to the front of the body, as the transverse springs are not adapted to transmit sudden changes of speed from the wheels to the inert mass of the body. Steering is by side or centre lever, as preferred. Thirty-inch wheels, with $2\frac{1}{2}$ in. pneumatic tires, are used; the wheel base is 62 in. and the gauge 54 in.

FIG. 8.—PLAN OF VALVE IN READING STEAM ENGINE.

The total weight of the car with the tanks filled is about 1,000 lbs. The petrol tank holds eight gallons, and the water tank thirty gallons, stated to be sufficient for respectively eighty and thirty miles.

Messrs. Vincent and Company, of 16, Union Court, Old Broad Street, London, E.C., who have secured the British agency for the productions of Messrs. D. Augé and Company, of Paris, had an interesting display of motors and chassis. Fig. 9 gives a general view of the latter. The vehicle is propelled by means of a "Cyclope" vertical two-cylinder motor (Fig. 11), located in the fore part of the frame. There are several special features about the motor which are worthy of mention. It comprises two cylinders side by side, the pistons of which are coupled together by a double connecting rod with a single cross-head on the crank pin of the driving shaft. A feature of the motor is that all the

valves are so arranged as to form a detachable box, attached to the rear end of the cylinders. This box comprises a number of cocks arranged to be operated both by hand and automatically, and permitting a regulation both qualitative and quantitative of the explosive mixture. The distribution box comprises two explosion chambers communicating respectively with the interior of two cylinders, and an exhaust chamber capable of communicating with these two explosion chambers by the intermediary of two valves. To each of these explosion

FIG. 9.—"CYCLOPE" CHASSIS.

chambers is connected respectively an ignition plug. Above the two explosion chambers is arranged a receiving chamber for the explosive mixture, capable of communicating with each of the explosion chambers by valves. A speed governor, acting on the inlet valve, is mounted on the fly wheel. The governor can be cut out at will, by means of a small handle placed under the steering wheel, so allowing the motor to race, in order to augment the speed of the car. The feeding of the engine is effected according to its own requirements; an explosive mixture always of an equal composition enters the explosion chambers, but in larger or smaller quantity; from this results, it is claimed, a variable compression, so that the force of the engine may be thus regulated between sufficiently wide limits by augmenting or diminishing at will the impulsive force of the explosive mixture, contrary to the ordinary method of regulation in which the speed is varied by suppressing the explosions. The exhaust valves are controlled by a series of levers and rocking arm, actuated by a cam mounted on a short half-speed intermediary shaft. A general view of the constant level carburettor is given in Fig. 12.

FIG. 10.—"CYCLOPE" HORIZONTAL MOTOR.

It is described as working equally well with alcohol as with petrol, and as being capable of micrometrical adjustment, permitting the spirit admission opening to be regulated to the 100th part of a millimetre. The motor, which is capable of developing 5 h.p., runs at a normal speed of 850 revolutions per minute. By means of the regulating cocks and the electric ignition, Messrs Augé claim to be able to vary the speed while running from between 300 to 1,200 revolutions per minute. The motor is, of course, water-jacketed, a radiating coil,

in connection with the water-circulation, which is maintained by a pump, being located in the front of the car. Coming now to the transmission mechanism, two speeds forward and a reverse motion are provided. As has already been mentioned, the motor is located in the fore part of the frame. On one end of the motor shaft is a pulley connected by a belt to a

FIG. 11.—"CYCLOPE" VERTICAL MOTOR.

fast and loose pulley on a counter shaft about the centre of the frame. This shaft carries a series of pinions, working in an oil-containing case, and meshing with corresponding pinions on the differential shaft, on the two ends of which are sprocket wheels conveying the power by chains to the rear road wheels. Steering is controlled by an inclined hand wheel; the frame, which is of channel steel, is spring suspended on artillery wood wheels shod with pneumatic or solid rubber tires as desired. There are three brakes, one operated by a pedal and acting on the differential (the application of which also ships the belt on to the loose pulley), and two controlled by a hand lever acting on drums connected with the sprocket wheels on the rear axle. The motor and transmission gear are mounted on a standard frame, to which any type of carriage body may be fitted. The "Cyclope" motor is made in the horizontal as well as in the vertical type,

FIG. 12.—"CYCLOPE" CARBURETTOR.

and samples of both were shown, each being of 5 h.p. and having two cylinders.

(To be continued.)

MESSRS. J. BLAKE AND Co. have removed their works to more extensive premises at Beaumont Street, Liverpool. The area of the new works is no less than 3,780 square yards, so that the firm are now in a position to undertake the storing and repairing of motor-cars. A stock of Pratt's motor spirit is also kept on hand.

FLOTSAM AND JETSAM.

BY "FLANEUR."

HOW one does love the British railways, to be sure! In their capacity for setting everybody by the ears, for tyrannising over the passenger and the trader alike, the various companies in this country enjoy a reputation which their continental *confreres* would be ashamed to emulate. We know how the fruit-growers of Kent are crippled owing to the impossibility of getting fruit to town in reasonable time or at reasonable rates, and in other portions of the kingdom various trades are handicapped by prohibitive tariffs on the consignment of goods. And now that automobiles are becoming a feature of our social life they, too, are included under the persecuting ban, as those of us who own cars have found to our cost.

WHAT could be more absurd, for example, than the stipulation that you must empty every drop of petrol from your tank if you consign your car by rail? Unless the companies encourage their employees to go about with naked lights, and to amuse themselves by turning every tap they see, there is no earthly reason why a man should be compelled to throw away his petrol, and so deprive himself of the ability to drive his car away on arrival at its destination. Some Jacks-in-office will even insist upon the discharging of the accumulators, where electric ignition is fitted; in fact, the companies appear to delight in causing harassment where they can, and in writing down their servants generally as a set of noodles, incapable of handling anything requiring the simplest of attentions.

In the matter of charges for automobiles, the rates of British railway companies compare most unfavourably with those of foreign countries. A Midland friend of mine lately had occasion to send a small car to the neighbourhood of London, and for the journey of 116 miles he was charged no less than £2 5s. This was by goods train only; by passenger train the charge would have been £3 10s. Compare this with the experience of another friend, who sent a much larger car from Paris to a town in Belgium, 220 miles away, for fifteen francs, or 12s. 6d., and this, too, by express train. The difference is enormous both in time and money. Here we have a continental company or companies in conjunction, conveying a motor-car by fast train, with a special truck, at a lower charge than a British company would levy upon an ordinary triecyle, if unaccompanied by its owner, with the added probability of its being injured in transit, and no possibility of recovering damages, unless a still higher sum had been paid and the machine consigned "at company's risk."

THE horse has been defined as the friend of man, but every time Bank Holiday comes round the conviction is forced upon us that man is by no means the friend of the horse. How completely farcical it is to assume that the automobilist is of necessity an animal hater, and that every owner of a horse is the reverse! It is true that we have no cause to respect the intelligence of the beast that shies without provocation, and we are occasionally made to suffer from equine fractiousness or irresponsibility. Even the non-shying horse, too, destroys our roads by the pounding of its hoofs, and pollutes the atmosphere with its deposits. All the same, we don't hate it, though we hope to see its numbers grow less and less as years roll on. But to contend that those who use horses also love them is a melancholy travesty of the facts. Five-sixths of those whom one sees upon the road with reins between their fingers regard the quadruped before them in a strictly utilitarian spirit, and the amount of flogging that takes place every day is realised by no one better than the automobilist, who covers many miles of road within the day, and sees countless displays of callousness and often cruelty. The number of over-laden carts out on the highways last Monday was astounding, and made one wonder what the inspectors of

the R.S.P.C.A. were doing. Two vehicles out of every three at least were carrying nearly double the load of revellers that the animal ought to have been expected to draw, and how some of the poor beasts got home at night one can only speculate.

TALKING of horses reminds me, by the way, of the extraordinary coincidence whereby Earl Roberts was the victim of a second carriage accident on the very day on which the *Motor-Car Journal* appeared with my reference to the one at Walthamstow a few days earlier. No motor-car was concerned, however, with the catastrophe at the Crystal Palace, which might have had the most serious results, and was quite bad enough as it was. But how calmly the good old British public does take these things, to be sure; yet if Earl Roberts had been pitched out of a motor-car there would have been no end of a row. But where horses are concerned the public mind seems as unreasonably indifferent as it is acutely sensitive when automobiles figure in the case. The usual crop of accidents to holiday-makers has accompanied the Whitsuntide celebrations, but the employment of the dangerous "beanfeasters' waggonette" still goes on unchecked.

JUDGING by the number of promises at present received the Automobile Club will need more cars than have as yet been placed at the Committee's disposal for next week's demonstrations. At the time of writing some forty members have offered their services and their cars in this connection, but this will not be anything like enough. Not all the cars can be spared for each of the three days, and even if they could they would by no means suffice for the purpose unless large numbers of abstentions were recorded on the part of the County Councillors themselves. The latter are expected to total some hundred and fifty per day, and as many cars can only convey two passengers besides the driver there will need to be a very big display of motor-vehicles outside Whitehall Court.

It is earnestly to be desired that more owners will come forward and assist in making these demonstrations the signal success which they deserve to be. Nothing is so convincing as a combined display. Fifty cars in a group are far more impressive than fifty on as many different roads, and the County Councillors cannot fail to be impressed if the Automobile Club's appeal for cars is suitably responded to. One may express the further hope that the instructions framed for the occasion by the Committee will be carefully studied and observed, and that where a private owner cannot attend in person, and sends his *mecanicien*, the man will have been carefully coached beforehand as to his responsibilities.

It has been a pleasure to note in the last two issues of *Country Life*, a couple of articles entitled "Misconceptions about Motor-cars," which should have a very useful influence on the numerous readers of that journal. The contributions in question are apparently written by someone with an intimate knowledge of automobilism in all its aspects, but are not phrased too technically for the intelligence of the uninitiated; yet they run through the whole gamut of the popular but fallacious theories about motor-vehicles, such as blowing-up tendencies, noise, vibration, smell, the frightening of horses, etc., etc., with a suitable explanation as to each. While misconceptions on the subject are so widespread the appearance of such articles in the non-technical press must be heartily welcomed, and *Country Life* is to be congratulated on its publication of these timely contributions.

BOSTON, U.S.A., has had on trial for some time two automobile fire engines, which have now completely demonstrated their superiority over the ordinary type of engine. In the winter season they are particularly valuable, as they are considered better hill-climbers than horse-drawn vehicles, especially in bad weather.

HERE AND THERE.

AT the Paris Salon this year the automobile has been introduced in the world of art in a painting by M. Acheverry, showing a fashionably-dressed lady in a motor-carriage.

AMONGST Bank Holiday attractions at Bexhill was the regular service of motor-cars to Hastings and back. At Brighton also a number of motor-cars were run along the coast and inland.

A NEW American four-cent postage stamp bears the design of an automobile—an electric coupé—having the Capitol at Washington for a background.

ON Sunday last M. Fouquier travelled from Tours to Paris in a 16 h.p. automobile without making a single stop, and maintaining an average speed of thirty-seven miles an hour throughout the journey.

AMONG the visitors to the recent exhibition was Alderman S. Compston, of Rossendale, who has written an interesting account of what he saw and did at the Agricultural Hall for the local papers.

MR. RUDYARD KIPLING, who made his *début* in the motor world on a Cannstatt-Daimler, purchased a Locomobile steam car during his recent visit to America, and is taking delivery next week.

A LETTER from the Secretary of the Automobile Club, with copy of a Memorial signed by manufacturers and agents in the automobile industry, was laid before the Hants County Council at its last meeting, but no action was taken with regard to it.

AMONGST the archives of Antwerp is reported to be a document dated 1479 authorising the Town Treasurer to pay a bonus of twenty-four livres d'Artois to a man named Gilles de Dom as an appreciation of his gift to the city of a "carriage set in motion by mechanical means only."

A COMPANY, known as the London and Counties Distributing Company, Limited, has been registered, with a capital of £1,000, to carry on the business of common carriers over any roads in the United Kingdom, by means of motor wagons, horse wagons, or otherwise.

FROM Messrs. Hewetsons, of 251, Tottenham Court Road, W., we have received a new illustrated catalogue of the well-known Benz motor-cars. The vehicles illustrated range from the 3½ h.p. two-seated car up to four-seated cars fitted with 10 h.p. engines and various types of bodies. Brakes, racing cars, light delivery vans, and the new Benz 2½-ton lorry recently illustrated in the *Journal* are included in the list.

ACCESSORIES and detachable parts for cycles and automobiles fill a bulky illustrated catalogue sent to us by M. Lewis Barnascone, 2, Rue de Braques, Paris. Practically everything that the motorist can require, from a pair of coloured glasses to a radiator, is therein illustrated, described, and priced. The appliances listed for purposes of generating, storing, and measuring electricity appear to be very complete.

THE Scott Tire Company, of Gosford Street, Coventry, has forwarded us a price list of the "Falconet Compound" tires, for which it is the sole agent in the United Kingdom and British colonies. The Falconet Compound tire is of two orders: "solid," which is suitable for any class of vehicle; and "light," which is semi-hollow and suitable for small motor-cars. Though comparatively unknown in our country, the Falconet Compound is well known and appreciated in France, as some excellent testimonials appended to the price list prove.

MESSRS. Gaston Sencier and A. Delasalle are publishing a book on electric automobiles. This is, we believe, the first book devoted entirely to the subject of electrically-propelled self-contained vehicles. We gather from a note from one of the authors that it will consist of about 400 pages, with numerous illustrations. The book, which is being published by La Librairie Dunod, 49, Quai des Grand-Augustins, Paris, as its title indicates, deals with the electrical side of the automobile movement. An English edition of the work is, we understand, contemplated.

THE American Motor Coach Company is the name of a company which has just been formed in Chicago with a capital of £20,000.

THE Electric Ignition Company, of Highgate Square, Birmingham, inform us that they have been obliged to advance the price of their De Dion sparking plug from 7s. to 7s. 6d. post free.

THE municipal administration of Stockholm, Sweden, is, it is reported, to be approached by the representatives of a syndicate of French manufacturers, desirous of obtaining a concession for the placing of automobile cabs and other vehicles on the streets of Stockholm for public use.

"TIRE TROUBLE TALK" is the title of a booklet sent to us by the New York Tire Company, of 5, Thavies Inn, Holborn, E.C., in which a description is given of the construction and advantages of the New York tire, which has just been introduced into this country.

AN automobile stable is being constructed on the Coats estate, at Newport, U.S.A., for Mr. William K. Vanderbilt, Jr., who has taken the place for the summer. Mr. Vanderbilt will have four automobiles there this season—his well-known white Daimler, two runabouts, and a high-powered vehicle, reported to be a German Daimler of the new Mercedes type.

AT Barry Police Court last week a motor-car driver named Thomas Myers was summoned for driving through the streets of the town without having two lights. Myers explained that he had just discovered that one of the lights was out when he saw the constable. A fine of 2s. 6d. was imposed.

THE Rev. H. Y. C. Blandford, of Pittsburg, U.S.A., has ordered a motor-car in which he will make a tour of the country. The vehicle will contain living and sleeping apartments, and provision will also be made for the carrying and cooking of food. It will have sliding and drop windows, and run on rubber-tired wheels.

ON Saturday last, on the Baslow Road, Totley, there occurred a serious motor-car accident. Colonel Turner, Mrs. Turner, Miss Butcher, and Captain Clincher, all of Chesterfield, were being driven in a motor-wagonette, when the rubber tire of one of the wheels came off, entwined itself around the axle, brought the vehicle to a sudden stop, and pitched the whole of the party violently into the road. Colonel Turner was stunned, and it was some time before he approached anything like consciousness. The other occupants of the vehicle were all in a more or less dazed condition for some minutes after their violent fall. The five unfortunate motorists were removed to the Cross Scythes Inn. About half-past five o'clock the party had recovered sufficiently to be removed, and they were driven to Totley Station, whence they proceeded to Chesterfield. Later inquiries show that the Colonel is progressing favourably, although it has been found that one rib was broken. Mrs. Turner and Miss Butcher are none the worse for their unpleasant experience, the driver, too, escaping with a bruised leg.

AN amusing incident happened on the Boulevard du Régent in Brussels the other evening about six o'clock. Owing to the recent orders issued as to the speed of automobiles, the police have been very much on the alert. Each time a *chauffeur* tried to pass a certain *gendarme* at too great a speed he pulled out a huge card, on which was printed in French the words "You are travelling too fast," and the reprimanded driver regulated his speed accordingly, at least as long as that particular policeman was in sight. Presently a luxurious automobile came gaily along at a great rate. The outraged policeman waved his arms and commanded the offender to stop, though the latter looked as if he felt more inclined to calmly ride over him. However, he slowed down, and the *agent* demanded his name in an energetic manner. "Morcel," replied the *mecanicien*. But the worthy man was no wiser. "What is your number?" he asked, and was told to look inside and see. Great was his consternation and confusion when, behind the glass screen of the automobile, he beheld the well-known features of the King of the Belgians. His Majesty smiled as he took in the humour of the situation, and the Royal vehicle pursued its way undisturbed.

WE hear that Lord Willoughby d'Eresby has purchased Mr. Weguelin's 12 h.p. Daimler car.

A COMPANY has just been formed in London, Ontario, with a capital of £5,000, to be known as the Canadian Steam Carriage Company.

THE British Vice-Consul reports that a service of motor-cars connecting the principal towns in the southern half of Cordoba, Spain, is to be inaugurated immediately.

IN a new church which is now being erected at Central Park West, in New York City, for the Christian Scientists, a room in the basement is set aside for the storage of motor-cars during services.

MOTOR-CARS are being used by the sanitary inspectors of Chicago, who find that they are able to cover in one day three times the ground formerly covered by horse and trap. The result is that slums are visited three and four times as often as formerly, and the sanitation of the city is improving.

MR. GEORGE PRADES, in the *Auto-Velo*, states that the Daimler Company at Canstatt and the Mors Company of Paris are engaged on the construction of vehicles having electric motors on each of the four wheels driven from a central petroleum spirit engine.

IN response to a request from the Commissioner of Police of the Metropolis, 550 notices concerning the regulations governing motor-cars have been circulated by the Automobile Club to owners and manufacturers of, and agents for, motor-vehicles throughout the kingdom.

THE French Minister of Public Works will give a prize for the Paris-Berlin race. It will take the form of an *objet d'art*. This is the third official prize given in connection with this contest, the Kaiser and the President of the Republic having each promised one.

THE Automobile Club of New Jersey has issued its first year-book, containing information about the roads in that State and New York, storage and supply stations, etc. The book also contains a road map of the State of New Jersey, section maps of different parts of the State, and also a map of parts of New York.

A NEW record was recently established between New Haven and Hartford, Conn., U.S.A., by Mr. Leonard E. Fisk, of Hartford, who covered the intervening forty miles in two hours and twenty-five minutes, actual running time, on a Columbia petrol vehicle. On the other side the performance is considered most remarkable, having regard to the condition of the roads over which it was accomplished.

MR. J. W. BARNARD, of 6, Great Winchester Street, has sent us a complete price list of E.P.S. storage batteries (the Q and V types) for which he is the sole agent in the United Kingdom. Mr. Barnard keeps a large stock of the cells on hand, so that customers may nearly always count upon uncharged batteries being despatched the same day as the order is received and fully charged batteries within two days.

MR. AND MRS. ROBERT SHAW, the first amateurs to make the journey from New York to Chicago in an automobile, recently arrived in the latter city, having accomplished the trip in easy stages in ten days and eleven hours. Only ninety-seven hours were spent in actual travelling. The rest of the time was devoted to necessary stops for sleep, refreshment, and repairs. During the trip they wore out two tires, and used one hundred and ten gallons of petrol, the car used being an 8 h.p. Panhard.

MR. PERCY HOOPER, of the Saint Pancras Borough Council Electricity and Public Lighting Department, writes that the above Council have two generating stations, one situated at King's Road, Camden Town, and one at Stanhope Street, Regent's Park, where recharging is undertaken. The price per unit adopted by the Council for this purpose is twopence. Cars of any voltage may be charged, but the amount will be in all cases charged as at 220 volts. The works are open day and night, and recharging can be done at any time except during the evening hours when the stations are working at top load.

REPAIR BANDS FOR PNEUMATIC TIRES.

PUNCTURED pneumatic tires being one of the great troubles experienced by motorists, any device which will mitigate the evil, or at least facilitate the repair of the tires, is sure to receive attention. No apology is, therefore, needed for our drawing attention to the "S.F." tire repair band lately introduced by Messrs. Stanley Feast and Co., of 9, Farringdon Road, London, E.C. The band is made in three sizes—8in. by 3½in., 10in. by 3½in., and 12in. by 3½in., and consists of a thin pliable band woven and prepared in a special manner, and covered with thin rubber tapered at the edges. In the event of serious damage occurring to a tire cover, or of weakness developing in the tire, the band should prove invaluable. The first thing to do is, of course, to repair the air

tube in the usual way, but when it is placed in the rim again, and the cover put in position, the band is taken, not solutioned, and placed over the cut or weakened part of the cover. One end of the band should then be slipped under the wire or beaded edge of the tire, and the other end under the opposite edge. The ends of the bands are firmly gripped between the tire and the rim, and on inflating, the band forms an excellent support for the damaged cover; in fact, the rubber cover to the band is thickened at the tread, like the tire cover itself, and altogether one or more of the bands should be carried in the repair kit in case of emergency. In the event of a very big gash, two bands slightly overlapping can be used.

THE *Madras Times* reports that a concern named the Chota-Nagpur Automobile Company has examined the routes of Hazaribagh, and intends starting a service of motor-cars almost immediately.

MESSRS. JOSEPH LUCAS, LIMITED, of Birmingham, have sent us a preliminary list of automobile accessories, dated May, 1901. The list, which is illustrated, is so complete that we wonder what more will be found in the subsequent list which the use of the word preliminary leads us to expect. Lamps, horns, pumps, sparking plugs, repairing outfits, and even eye-protectors, with everything else the motorist can possibly press into his service, are to be found in the list, not forgetting oils for lamps and motors, all in neat and handy form.

THAT there is no falling off in the popularity of the motor-cars at Bournemouth is evident from the fact that eight vehicles belonging to Bournemouth Motors, Limited, carried on Whit Monday no less than 2,962 passengers. The mileage run was about 664, and, although each of these cars has been doing public-service work for over a year, only two stoppages occurred during the day, one due to a chain coming off, and the other in order to change a burner. Neither of the stoppages caused a delay of more than two minutes. Altogether, the Bournemouth service is an excellent example of the reliability of properly-constructed cars, when they receive the attention necessary for all machinery.

THE LIVERPOOL HEAVY MOTOR-VEHICLE TRIALS.

A CONSIDERABLE amount of interest centres in the forthcoming trials of motor-vehicles for heavy traffic, organised by the Liverpool Self-Propelled Traffic Association, particularly amongst those who are nearly concerned in the question of the cheaper and rapid conveyance of goods over moderate distances. The official programme of the "third trials," which has just been issued, shows that, extensive and exhaustive as were the previous trials, those that are approaching are of a wider and more exacting character, and, generally speaking, the programme is of a most elaborate character. Thanks to the ceaseless energy of the hon. secretary, Mr. E. Shrapnell Smith, everything has been arranged in good time, and, looking to past meetings, one can only hope that the trials which are now approaching will be at least as successful as they were.

The conditions of the competition provide that the vehicle shall be self-propelled and self-contained. It shall be propelled by mechanical power alone, but there shall be no restriction on the source of such power or the nature of the agents used.

The vehicle shall be capable of going anywhere that a horse-drawn vehicle carrying the same load is ordinarily required to go, and of being placed in the same positions and withdrawn therefrom without external assistance. The particular manœuvre most generally called for is to work into and out of a loading berth when cramped for room. This requirement arises in the case of embayments, or of confined spaces between other vehicles in a line receiving or discharging goods. Carters usually back into such positions obliquely, and bring the vehicle into line by turning the leading wheels at right-angles to the rear wheels and again

Vehicles Eligible for Competition—

Class	Load.	Maximum Tare.	Minimum Level Platform Area.	Minimum width of Driving Tires.	Speed.
A	1½ Tons.	2 Tons.	45 square feet	3 inches.	8 m. per hr.
B	5 "	3 "	75 " "	5 " "	5 " "
C	5 "(minimum)	No Limit.	95 " "	6 " "	5 " "
D	4 " "	" "	Not specified.	4 " "	5 " "

Rules and Conditions.

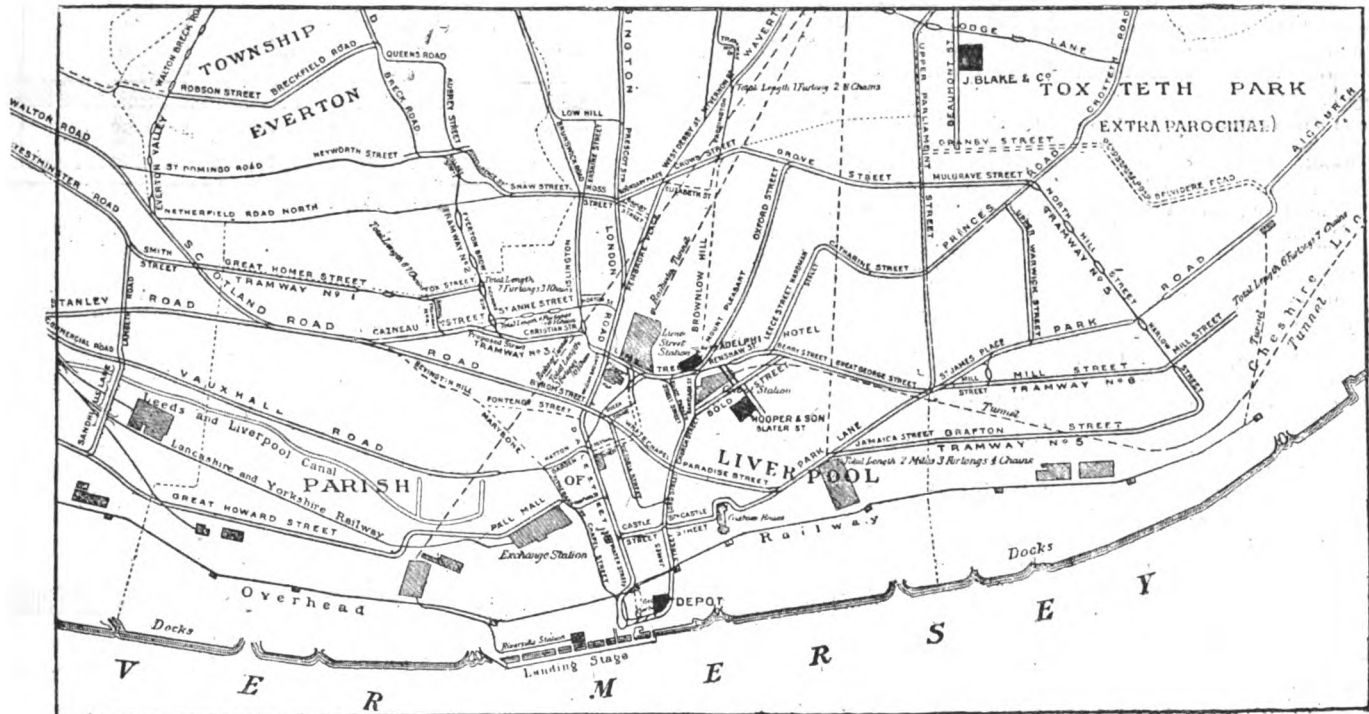

The vehicle shall carry the weight of goods specified for its class, any excess weight in Class C or D being declared in advance by the competitor throughout the continuance of the trials.

Two official observers will accompany each vehicle during the trial runs, to take notes of behaviour, fuel and water consumption, etc., and no repairs will be permitted without their knowledge and consent.

Any vehicle withdrawn from competition during the trials, except under the written authority of the judges, shall be ineligible for a prize or for commendation.

Each competitor shall arrange to have his vehicle or vehicles ready for inspection by the judges at 3 p.m. on the afternoon of Friday, May 31st, 1901, in the Liverpool Depot, when the dimensions, capacities, and weights will be taken by the observers.

All vehicles shall be stored over-night at the depot or depôts provided by the Association.

MAP OF LIVERPOOL, SHEWING PRINCIPAL STREETS.

backing, but it is open to competitors to perform the manœuvre as they think best.

The vehicle shall be capable of working into and out of an embayment of one and a half times its own length.

The vehicle shall be capable of starting from rest on, and mounting a gradient of 1 in 9 (sets).

The capacity of any water tanks, whether the same be fitted for feed, cooling, or other purposes, shall suffice for a run of 15 miles on the basis of the consumptions during the trial runs.

Such portion of the platform of the vehicle as is designed to carry the load shall be level, and the height of the floor-line, measured either when light or when laden, shall not be less than 3 ft. 6 in., and shall not exceed 4 ft. 3 in.

The vehicle shall conform in all respects to the requirements of the Locomotives on Highways Act, 1896, and, in the case of its being oil-propelled, of the "Regulations as to Petroleum" issued by the Home Secretary under Section 5 of this Act. In Class C, intended for vehicles for export to the Colonies and abroad, there is no tare limit, but the other regulations must be adhered to.

All working parts shall be properly encased.

The boiler, tanks, oil-baths, and connecting pipes shall be fitted with drain-plugs at their lowest points.

The cross-section of any pipe connecting two tanks shall be not less than that of the pipe provided for filling the first tank of the two.

Provision shall be made to lock the compensating gear.

At the conclusion of the trials any vehicle, or motor, or part thereof, shall be opened up, in confidence, for inspection by the judges, if required.

The judges reserve to themselves the right of absolutely disqualifying any competitor.

The following are the points which will be taken into consideration by the judges in making the awards:—

Cost.—Prime cost. Economy of working, including attendants.

Control.—Stopping, starting, changing speed, steering and reversing, particularly under adverse conditions, such as on inclines, in confined spaces, or on greasy surfaces.

Working.—Adhesion on greasy surfaces when light and when laden. Noise, smell, visible vapour, dust or other nuisance when travelling. Number of mechanical operations requiring attention from the driver. Efficiency of brakes. Time occupied in preparing the vehicle for service on the road. Speed (within legal limits). Ability to travel between the depôts without taking or receiving supplies of fuel, oil, gas, electrical or chemical materials or electrical current, water, or of any agent employed for actuating the motor or assisting its working. Ability to travel between the depôts without stopping to effect repairs, adjust parts, apply lubricants, or for any other purpose or cause not provided for in the itinerary. Freedom from a breakdown of any nature.

Construction.—Ratio of tare to weight of freight carried during the trials. Percentage of total weight on driving wheels, when light and when laden. Ratio of available platform area to extreme moving area in any horizontal plane. Efficiency of wheels. Nature and efficiency of

gearing. Strength of frame and working parts. Quality of workmanship. Efficiency of springs. Freedom from complicated or over-refined parts. Facility with which repairs can be effected. Capacity of bunkers or oil tanks.

Steam-propelled Vehicles.—Provision to secure invisible exhaust. Ample supply of steam. Action of feed-pumps or injector, and ease of control of water-level. Consumption of fuel and water per mile. Leakage of steam or water. Arrangements for stoking.

Oil-propelled Vehicles.—Nature of variable speed arrangement, and smoothness with which changes of gear are effected. Carburettion. Ignition. Circulation of cooling-water and quantity required. Consumption of oil per mile. Leakage of pipes or tanks.

Electrically-propelled Vehicles.—Battery power to travel 40 miles on one charge. Nature of the arrangements for varying discharge rate. Method of carrying the battery and replacing same. Simplicity of controller. B.T.U. per mile.

The decision of the judges, expressed in writing on any point, shall be final and binding on all parties, and they may withhold any reward or any portion thereof.

The following is the programme :—

Monday, June 3rd, will be devoted to hill-climbing tests at Everton and manœuvring tests at the Docks. The Liverpool depot, where the vehicles will be on exhibition, is the shed and open space at the west side of the George's Dock. This has been placed at the disposal of the Association by the Mersey Docks and Harbour Board. Accommodation for the visiting light carriages has been provided, free of charge, by Messrs. Hooper and Son, Slater Street, and Messrs. J. Blake and Company, Beaumont Street (old tramway depot). Belle Vue has been placed at the disposal of the Association as the Manchester depot by Messrs. John Jennison and Co., and the Artillery Barracks, King Street, Blackburn, by Colonel Thom and officers of the Lancashire Artillery Volunteers (third brigade). The routes and approximate time-tables for the four distance trials will be as under :—

June 4th (Tuesday).—Liverpool (George's Dock) depart 9.15 a.m., Widnes (Town Hall) arrive 11.30 a.m., Warrington (Town Hall) arrive 12.45 p.m. Warrington depart 1.45 p.m., for Manchester, via Hollinfare and Eccles. Manchester (Town Hall) arrive 4.30 p.m., Belle Vue (Longsight entrance) 5.30 p.m.

June 5th (Wednesday).—Albert Square depart 9.15 a.m., Bolton (Town Hall) arrive 12.15 p.m. Bolton depart 1.30 p.m. for St. Helens, via Atherton, Leigh, Pennington, Newton, and Haydock. St. Helens (Town Hall) arrive 4 p.m., Liverpool (George's Dock) arrive 6.15 p.m.

June 6th (Thursday).—Liverpool (George's Dock) depart 9.15 a.m. for Wigan, via The Horns, Knowsley, Rainford, and Billinge. Wigan (Market Square) arrive 1 p.m. Wigan depart 2 p.m., Chorley (Cattle Market) arrive 3.45 p.m., Blackburn (Artillery Barracks) arrive 6 p.m.

June 7th (Friday).—Blackburn (Artillery Barracks) depart 9.15 a.m., Preston (covered market) arrive 11.30 a.m., Rufford (Hesketh Arms) arrive 1.15 p.m. Rufford depart 2.15 p.m., Ormskirk (Clock Tower) arrive 4 p.m., Liverpool (George's Dock) arrive 6.15 p.m.

The following are the entries :—

CLASS A.—Load, 1½ tons ; maximum tare, 2 tons ; minimum level platform area, 45 sq. ft. ; minimum width of driving tires, 3 in. ; speed, 8 miles per hour.

Official No.

A 1. Geo. F. Milnes and Co., Limited, Motor Department, "Motoria," 17, Balderton Street, Oxford Street, W.

CLASS B.—Load, 5 tons ; maximum tare, 3 tons ; minimum level platform area, 75 sq. ft. ; minimum width of driving tires, 5 in. ; speed, 5 miles per hour.

Official No.

B 1. The Lancashire Steam Motor Company, Leyland, near Preston.

CLASS C.—Minimum load, 5 tons ; no tare limit ; minimum level platform area, 95 sq. ft. ; minimum width of driving tires, 6 in. ; speed, 5 miles per hour.

Official No.

C 1. The Thornycroft Steam Wagon Company, Limited, Chiswick and Basingstoke.

C 2. C. and A. Musker, Limited, The Brook, Liverpool—oil firing.

C 3. " " " " " " coke firing.

C 4. Simpson and Bibby, Pomona Engine Works, Cornbrook, Manchester.

CLASS D.—Minimum load, 4 tons ; no tare limit ; level platform area not specified ; minimum width of driving tires, 4 in. ; speed, 5 miles per hour.

Official No.

D 1. The Thornycroft Steam Wagon Company, Limited.

D 2. T. Coulthard and Co., Limited, Cooper Road, Preston.

D 3. Mann's Patent Steam Cart and Wagon Company, Limited, Canning Works, Dewsbury Road, Leeds—cart and wagon respectively.

D 5. Simpson and Bibby. [This vehicle not ready in time to compete.]
D 6. The Mechanical Transport Company.

Below is a description of the vehicles that have been entered :—

CLASS A.—Vehicles Nos. A1 and A2. £550. George F. Milnes and Co., Limited.—Each vehicle is 17 ft. long, by 4 ft. 9 in. wide. The wheel base is 11 ft. Hinged sides, 8 in. in height, are fitted to the platform. The frame is constructed of U channel steel, and will bear a total dead load of up to three tons. The motor is a two-cylinder light hydrocarbon engine, built on the Daimler principle throughout, with Daimler float feed, governor, and patent water-cooler of the marine condenser type. The number of revolutions per minute is 750, accelerating up to 1,000, and the brake horse-power is 10. Lubrication is effected by means of gravity oil feed cups ; water circulation by a gear-driven rotary pump. The petrol is fed by pressure from a portion of the exhaust, ignition being by the Simms-Bosch magneto-electric system. The transmission is by a single friction cone on the Daimler principle. The power is transmitted from the main longitudinal shaft through the differential gear on the Cannstatt system, by means of two pinions engaging two internal gear

DIAGRAM OF GRADIENTS—HILL CLIMBING CONTESTS.

wheels fixed to the back road wheels. The speed-changing gear is on the Cannstatt system, four speeds being provided, viz., 1½, 2½, 4, and 6 miles per hour. With this Cannstatt gear, the first and second, and the third and fourth, speeds are each controlled by one lever, by which means, as the two couples of speeds are independent of each other when changing, neither couple affects the other set of gear wheels. The Cannstatt principle for changing speeds also automatically disengages the friction cone when either speed lever is actuated. The reverse speed is obtained by dropping into gear a special cog-wheel, giving a speed of 4 miles per hour. The lever actuating the reversing gear also disengages the forward speeds, or puts them out of gear. Two circumferential brakes, worked by worm gear from the driver's seat by hand, act on the hind wheels. There is also a double-acting brake clutch on the first speed shaft, and a sprag on the back axle.

CLASS B.—Vehicle No. B1.—£530. The Lancashire Steam Motor Company.—This vehicle is 18 ft. 4 in. long, by 6 ft. 5 in. extreme width. The platform, which is of the ordinary lorry type, and has 75 sq. ft. of

available space inside the beading, rests on the main frame of channel steel. The height of the platform from the ground is 3 ft. 6 in. when loaded with 5 tons. The wheels are of the military type with steel naves, oak spokes, and ash felloes. The drive is taken on the felloes close to the tire, thus relieving the spokes of all the strain usually put upon them by the driving force. The front wheels are 2 ft. 10 in. diameter, and have tires 4 in. wide. The back wheels are 3 ft. diameter, with tires 5 in. wide. The boiler is of the fire-tube type, and has 80 sq. ft. of heating surface. It is fired from the top through a central shoot, the fuel used being gas coke. It is tubed with tough, seamless copper tubes, and a fusible plug is fixed in the crown plate of the fire box. The working pressure is 225 lbs. per square inch, and the test pressure 450 lbs., the safety valve being set at 225 lbs., and blowing into the water tank. The automatic feed pump works off the compensating gear shaft; it is arranged so that any excessive water above the amount required to feed the boiler is pumped back to the tank, the regulation being performed by a hand wheel fixed to the driver's seat, whilst a small steam pump is placed under the seat for auxiliary feeding. The fire is regulated by a hinged ash pan, and also by the lid covering the central firing shoot. A Klinger safety water gauge is fitted. The boiler is placed in front of the driver's seat, with the coke bunkers on each side, the fuel capacity being sufficient for an ordinary day's work. Double check valves are fitted to both feed pumps. The engine is horizontal, compound, reversing, with cylinders $3\frac{1}{2}$ in. and $6\frac{1}{2}$ in. diameter by 6 in. stroke. It runs at 420 revolutions per minute. The engine, the change gear, and the compensating gear are entirely enclosed in a dust-proof, oil-tight casing, thus ensuring perfect lubrication of all parts. There are exceptionally large and long wearing surfaces. An arrangement for working both cylinders with high-pressure steam is fitted. The gearing is of steel throughout, and all wheels have machine-cut teeth. The drive from the end of the compensating gear shaft is taken to the felloe of the wheel by a Renold Silent chain, improved pattern, this chain having all its links bushed with hardened steel, and pins of large diameter also hardened. The cushion drive, arranged in the small, hollow pinions on the compensating gear shaft, is an important feature in this machine. It relieves the chains and the working parts of the engine of the shock usually put upon them when starting a heavy load, for, with this arrangement, the engine gets almost a revolution before the full power is exerted at the road wheel. The compensating gear shaft is of special construction, being hollow from end to end. A bolt is put through this shaft and takes the end thrust caused by the bevel wheels off the bearings, thus reducing the friction considerably. The compensating gear can be locked by an internal clutch arrangement by pulling a lever under the frame of the vehicle. There are no keys used in the machine, all wheels being put on flanges. Castellated nuts are used throughout, each being secured by a split pin. The water tank has a capacity of 150 gallons, and is fitted with a removable strainer. A water lifter and 40 ft. of suction hose are supplied with the machine.

CLASS C.—Vehicle No. C1. £750. The Thornycroft Steam Wagon Company, Limited.—This vehicle is 22 ft. 6 in. long, by 6 ft. 6 in. extreme width across platform. The wheel base is 12 ft. 6 in. longitudinally, and 5 ft. 7 in. (centre to centre of tires) transversely. The leading wheels are 2 ft. 9 in. diameter, with 6 in. tires, and the driving wheels 3 ft. 6 in. in diameter, with 8 in. tires. The wheels are of the Company's standard construction, with metal naves, oak spokes, ash felloes, and steel tires. The tires are of special steel, and are weldless. The ordinary divided axle method of steering is adopted, the leading wheels being turned by a hand wheel operating through a worm gear; the steering gear is thus self-locking in all positions. The leading axle is mounted on a pivot at its centre, which ensures the vehicle a three-point support, and relieves the channel-steel underframe from transverse twisting actions. The carrying platform is of the usual Liverpool lorry type, surrounded by a low rim. Provision is made also for mounting steel stanchions, with connecting chains, when required; this platform is of very substantial construction, and is of oak. The dimensions of level platform area are as follows:—Length, 15 ft. $1\frac{1}{2}$ in.; width, 6 ft. $5\frac{1}{2}$ in.; area, 97.5 sq. ft.; the height of the platform above the road surface, when the vehicle is unloaded, is 4 ft. 3 in. The boiler is of Thornycroft patent central-fired steam wagon type, having straight water-tubes circularly arranged around the fire. The total heating surface is 132 sq. ft., and grate area 4.25 sq. ft.; the gauge working pressure is up to 225 lbs. per square inch. It is placed in the centre of the front of the vehicle, and all mountings are arranged so as to be easily within reach of the driver, and in full view. Coke or coal is used as fuel, and the fire is served through the central firing-hole of the top vessel; regulation is obtained by a hinged door in the ash pan, and by the firing-hole cover. Two safety-valves are fitted, one of which lifts if the normal working pressure is exceeded, while the second is set at about 10 lbs. per square inch above normal pressure, and rises in the event of the first failing to act from any cause. The water gauge is of the "Reflex" unbreakable pattern; all mountings are so designed as to be readily and thoroughly cleansed from limy deposit. When the wagon is running the boiler is fed by a pump driven directly by the engine; when stationary, the engine may be disconnected from the transmission gear and run free, thus feeding the boiler; or the feed water may be supplied by an injector of special pattern mounted on the boiler itself. This injector is so designed that the cones may be removed for examination, adjustment, or cleansing while the boiler is under steam. The feed supplied by the engine pump is heated by the exhaust steam, thus economising fuel. Suitable screw plugs are fitted in the bottom cover of the boiler for

draining and cleaning; a blow-off cock is also fitted. The fire is cleaned through a special "clinking-hole," easily accessible from the rear side of the vehicle. The water tubes are cleaned by removing the top cover and passing a steel wire brush through each. The soot on the outsides is removed by taking off the sides of the boiler casing; this casing has been expressly designed so that the sides may be easily taken out and replaced for this purpose. The boiler has ample steaming power, and, due to the large volume of the fire box, requires serving with fuel at intervals of about three-quarters of an hour only. The engine is horizontal, compound, reversing, having cylinders 4 in. and 7 in. in diameter by 5 in. stroke, with a constant lead radial valve gear of special design, permitting of any degree of linking-up. It is completely enclosed in a dust-proof and oil-tight casing; at the same time, all parts are readily accessible for adjustment. The lubrication is by the "splash" method. The engine indicates 30 h.p., at 500 revolutions per minute. The exhaust passes through a feed-heater, and is thence discharged into the smoke box; a spark-arrester is fitted in the smoke box, through which all the flue gases are drawn by the draught created by the engine exhaust. The exhaust steam mingles with the flue gases, and is emitted invisibly from the funnel. The transmission is of the Thornycroft patent chainless type, and is fitted with a special gear for hill-climbing. A machine-cut steel pinion mounted on the engine crankshaft meshes with a machine-cut bronze spur-wheel on the first portion of the countershaft. The countershaft is in three separate parts, the middle portion being connected with the first and third by special enclosed large-surface universal couplings, whereby the vertical motion of the bearing springs is taken up in a mechanically perfect manner, the driving effort on the rear wheels being continuous even over the roughest roads and under all conditions of loading. The third countershaft part carries a cast-steel, double-helical pinion; this third part is itself borne in bearings formed in a pair of arms carried on the rear axle, and restrained from the underframe; these arms being one form of the Thornycroft patent bell-crank drive. The cast-steel double-helical pinion meshes with a cast-steel spur ring borne on the differential gear, which is carried by the rotating rear axle. The rear axle is itself borne in axle boxes of the locomotive type, attached to the centre of the plate rear-bearing springs, and the road wheels are finally driven by the method known as the company's patent spring drive, short helical springs, in compression, being employed in this case. For stiff gradients, or bad roads, a smaller steel pinion on the engine crankshaft is caused to engage with a larger spur wheel on the first part of the countershaft, thus giving a greater ratio of gearing down between engine and road wheels. The normal gear ratio is 12.4; the hill-climbing gear ratio is 21.7. A powerful screw-down brake is fitted, whereby wooden brake blocks are applied to each rear tire; reversal of the engine provides a second ready and effective braking action, much employed by drivers; a foot-operated band brake is also provided for in the design. The bunkers have a capacity of 38 c. ft., which is estimated to carry the fully-loaded vehicle a distance of fifty miles. The feed tank contains 240 gallons of water, which should take the fully-loaded vehicle eighteen to twenty miles. A steam water lifter is fitted on the feed tank, and a length of hose provided; by this means the tank may be replenished from any source available on the route; the tank can be filled in about five minutes. Apparatus is fixed for blowing the soot from the exterior of the boiler tubes by means of a steam hose. A steam blast is also available for accelerating steam raising, and a bye-pass valve is fitted for admitting full boiler pressure to the low-pressure cylinder when occasion demands. The vehicle is fitted with a draw hook, enabling a trailer to be hauled when required.

CLASS C.—Vehicle No. C2 (Oil Fuel). £450. C. and A. Musker, Limited.—This vehicle is 18 ft. long by 6 ft. 6 in. extreme width. The wheel base is 10 ft. longitudinally and 5 ft. 7 in. (centre to centre of tires) transversely. The platform, which is wholly made of hard wood, exactly similar to an ordinary Liverpool lorry, is 18 ft. long by 6 ft. 6 in. wide, and has 110 sq. ft. of available surface for carrying goods. It is supported on springs, and has no machinery attached to it, so that it can spring, bend, or crosswind without affecting the machinery. The height of the platform is 4 ft. when light and 3 ft. $9\frac{1}{2}$ in. when loaded with 5 tons. The wheels are 3 ft. and 3 ft. 4 in. diameter, the front tires being 5 in. wide and those of the driving wheels 6 in. wide. They are of the military type, running loose on the axles, with metal naves, oak spokes, and ash felloes. The steering is on the Ackermann principle, controlled by a screw and hand wheel. The arrangement of the boiler and machinery is on the Musker automatic system; that is, the supply of the air, oil, and water to the boiler is wholly automatic, independent of the driver, and in proportion to the amount of steam required, thus leaving the driver only to start, stop, and steer the vehicle. The boiler is the Musker patent semi-flash type (requiring no water level or water gauge-glass), wholly made of weldless steel coiled tubing with only three joints. It is fixed on the machinery platform underneath the wagon. The heating surface is 70 sq. ft. and the test pressure 2,500 lbs. per square inch. The fuel used is crude, or any ordinary commercial, petroleum and some kinds of refuse oil. The working pressure is 250 lbs. per square inch; two safety valves are fitted, escaping into chimney. The boiler feed pumps are in duplicate, coupled together and driven by steam separately from the main engine. They also drive the oil pump and air fan. The speed of the pumps is governed automatically by the pressure of steam in the boiler; that is, when the steam pressure reaches the maximum the feed pumps and fan will run at the lowest speed, just keeping up the pressure, yet not exceeding it; immediately the pressure drops the speed of the

feed pumps and fan increases to their maximum until the boiler pressure reaches its maximum, when the speed again decreases. The oil burner is the Musker patent type, in which the oil is vapourised and mixed with all the air required for combustion before leaving the burner. It has no small holes to become choked with carbon, and the strength of the flame is varied automatically in accordance with the heat required. The engine is horizontal reversing, with four single-acting cylinders $4\frac{1}{2}$ in. diameter by 5 in. stroke. It is entirely enclosed in a dust-proof oil-tight casing, and made suitable for using superheated steam. Steam lift valves of the mushroom type are fitted, and a special wedge-type reversing gear allowing the driver, with his reversing handle, to run the engine with a steam cut-off varying between $\frac{1}{4}$ and $\frac{3}{4}$ stroke. The full-speed revolutions are 500 per minute, and the engine will develop 25 b.h.p. No condenser is fitted, the exhaust being superheated and passed into the chimney. The usual differential gear is fitted with bevel wheels and pinions working in an oil bath, and the wagon is driven by either single or double gear, the ratios of gearing between the axle being 12 to 1 and 26 to 1. The driving wheels of the wagon are driven through the fellows by means of a wrought iron plate bolted on, and by toothed spur gear consisting of internal wheels made of steel mixture bolted to the plate, which gear with the wrought steel countershaft pinions. All the wheels have teeth machine cut from the solid. All the machinery is carried by a platform or frame made of teak, strengthened with wrought steel plates suspended at each corner to the axles, and fitted with spiral steel springs in such a manner that the extra shock of starting quickly or undue jolting is absorbed by the springs, and is prevented from injuring the gear or engines. A screw-down band brake is fitted to the outside of each internal driving wheel, the reversing of the engine providing the second brake. The water tank has a capacity of 160 gallons, and the oil tank a capacity of 50 gallons. The driver's seat is placed on a front corner of the wagon, but can be placed right in front, leaving an absolutely clear platform area of 18 ft. by 6 ft. 6 in., or 117 sq. ft.

CLASS C.—Vehicle No. C3 (Coke Fuel). £400. C. and A. Musker, Limited.—This vehicle is identical with the one above described, except that the fuel used is steam coal or coke. The feed pump is driven from the engine shaft by spur gearing, and the amount of water delivered to the boiler is automatically determined by a superheat regulator, the driver not having to give it any attention. The firing is central and from a hopper on the top of the boiler, the fierceness of the fire being automatically regulated by a steam pressure governor acting upon a centrifugal fan, and so shutting off or putting on the forced air blast, as more or less steam is required. No attention is required by the driver beyond keeping his hopper filled with coke about once every three hours.

CLASS C.—Vehicle No. C4. £650. Simpson and Bibby.—This vehicle is 17 ft. long by 6 ft. 6 in. extreme width. The level platform is 11 ft. 6 in. long by 6 ft. 6 in. wide, and has 74.75 sq. ft. of available space for goods. It is designed to carry a net load of 5 tons at 5 miles per hour, to haul a trailer carrying an additional load of 3 tons, and to ascend gradients of 1 in 9. The wheels are of the makers' improved military gun carriage pattern, with phosphor bronze hubs lined with magnolia anti-friction metal. The spokes and felloes are of teak. The steering wheels are 32 in. diameter, with steel tires $4\frac{1}{2}$ in. wide, and the driving wheels are 36 in. diameter, with 6 in. tires. Ball thrust collars are fitted throughout to reduce end friction. The steering is of the makers' outside arm type, the mechanism having no loose joints or gearing. The following advantages are claimed for this method. Ease of manoeuvring in crowded traffic, thorough control of the vehicle, absence of backlash, small amount of energy required owing to the stresses being taken on ball thrust collars, and simplicity of mechanism. The boiler is the makers' positive circulation type, generating super-heated steam under automatic control, and has been tested to 1,000 lbs. per square inch. There are no internal joints exposed to the fire gases, and it is claimed that any water can be used without the necessity for cleaning out arising. The following advantages are claimed for this type of "instantaneous" generator: Absolute safety, great simplicity, ready adaptation to meet the varying requirements of the road, load, and weather; freedom from scale or deposit, automatic working, economy in fuel and water, and large capacity for rapid hill-climbing. The engines are of the Simpson and Bibby single-acting type, all the bearings being in constant thrust, with automatic lubrication and fully enclosed. Each of the two engines has three cylinders 4 in. diameter by 4 in. stroke. There are no slide valves, piston valves, or stuffing boxes, the steam being admitted by plain lift valves only, and no loose parts in the crank chamber. The engines can develop 50 h.p. on the brake when necessary. The following advantages are claimed for this type of engine: Freedom from vibration, great simplicity, small amount of attention required; no knock due to wear, no parts to adjust, great power for hill climbing, economy in steam consumption, and accessibility. The gearing is of bronze and steel, all machine cut, two ratios being provided. The double-acting pumps are of large capacity, and made of phosphor bronze throughout. The framework is of the best Indian teak, plated with spring steel. There are four members, each 5 in. deep by 2 in. wide, running parallel to one another for the full length of the vehicle, without any transverse joints, but cross-braced with teak and steel. The following advantages are claimed for this construction: Great strength combined with flexibility; freedom from the trouble of adjacent members disconnecting by reason of the firm method in which the steel can be bound to the wood; freedom from jar, owing to the action of the timber in absorbing vibrations on rough roads. The tanks hold sufficient water for three hours; the bunkers sufficient coal for six hours. A Gresham

and Craven steam sanding gear is fitted for use in frosty weather, and a steam lifting gear for filling the tanks with water, together with 30 ft. of special armoured hose.

CLASS D.—Vehicle No. D1. £650. The Thornycroft Steam Wagon Company, Limited. This vehicle is 18 ft. 6 in. long by 9 ft. extreme width. The wheel base is 10 ft. longitudinally and 5 ft. $6\frac{1}{2}$ in. (centre to centre of tires) transversely. The leading wheels are 2 ft. 9 in. and the driving wheels 3 ft. 3 in. in diameter. They are of the company's standard construction, having metal naves, oak spokes, ash felloes, and steel tires. The tires are $4\frac{1}{2}$ in. wide on the leading wheels and 5 in. on the drivers. The steering is by the divided-axle method, the leading wheels being turned by a hand steering wheel operating through a worm gear, and is therefore self-locking in all positions. The steering gear is so designed that all the straining actions are self-contained. There is an open lorry platform, the dimensions on level being 12 ft. 6 in. by 5 ft. 8 in. The loading area is, therefore, 71 sq. ft. The height of the platform above the road surface, when unloaded, is 4 ft. 3 in. The boiler is of similar pattern to that of No. 2 of the 1899 trials, viz., two horizontal annular water spaces connected by straight tubes: the top vessel has been increased somewhat in depth, but in other respects the type is unchanged. The boiler casing has, however, been simplified, and is now readily removable, giving access to the exterior surface of the tubes for cleaning. The heating surface is 83 sq. ft., and grate area 2.4 sq. ft. The gauge working pressure is up to 200 lbs. per square inch. The fuel is good coke, or steam coal. The engine also is of similar type to that of No. 2 of 1899; it is enclosed, hori-

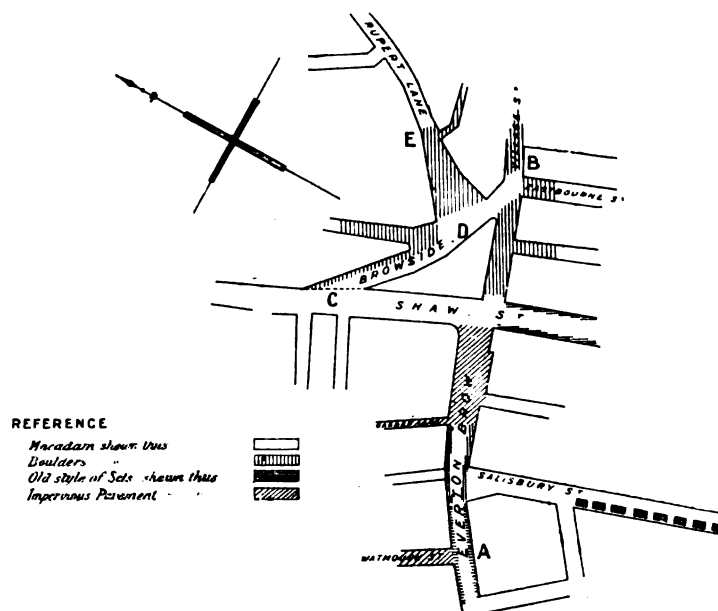

DIAGRAM OF ROUTE OF HILL-CLIMBING CONTESTS.

zontal, and compound, with cylinders 4 in. and 7 in. diameter by 5 in. stroke; at 5 miles per hour the engine makes 440 revolutions per minute, and will develop 20 b.h.p. at this speed. The transmission is chainless, and in its main features resembles that of No. 2 of 1899. Two machine-cut pinions ride upon a square formed on the engine crankshaft, either of which may engage with machine-cut spur wheels on the first part of countershaft (giving thus the normal and hill-climbing gears respectively). The countershaft is, as before, in three pieces united by special universal joints. The third countershaft piece is, however, carried in a much improved manner. The perch frame of 1899 is now entirely absent, and is replaced by a pair of brackets of simple triangular form, borne on the rear axle, and carrying the third countershaft part with double-helical cast-steel pinion, in a pair of ordinary adjustable bearings. This device is termed the Thornycroft patent bell-crank drive, and is a feature of all present standard vehicles of this company. The bell-crank is prevented from turning round the rear axle by a radius rod hinged to the under-frame of vehicle in such a manner as to permit full play to the rear bearing springs. It will be observed that, by this device, the transmission, whilst mechanically perfect, has minimum restraint of all parts, and is thus relieved from all unnecessary straining action. The rear wheels are driven by the Thornycroft patent spring drive as in 1899; the total gear ratios are 10.1 and 17.7. Shoe-brakes are fitted, operating on both rear wheels, and applied by the driver through a foot lever. Reversal of the engine provides the second brake required by law. The bunkers carry about 6 cwt. of coal, and the feed-tanks have a joint capacity of 168 gallons. The vehicle is fitted with draw-gear, enabling a trailer to be hauled when desired.

CLASS D.—Vehicle No. D2. £535. T. Coulthard and Company, Limited.—This vehicle is 18 ft. $5\frac{1}{2}$ in. long by 6 ft. 6 in. extreme width. The level platform is 12 ft. 6 in. long by 6 ft. 6 in. wide, and has 81.25 sq. ft. of available space for goods. It is designed to carry a net load of from 4 to 5 tons of goods. The road wheels are of gun carriage pattern,

and fitted with steel hubs and bronze bushes. The felloes are of ash and the spokes of oak. The front wheels are 2 ft. 9 in. diameter with 5 in. tires. The hind wheels are 3 ft. diameter with 6½ in. tires, and are fitted with the makers' triangular drive and band brake drum, whereby the drive is taken direct to the wheel felloes. The boiler is of the vertical fire-tube type, with straight solid drawn steel tubes, suitable for either coke or coal, and the tubes are electrically galvanised, making them non-corrosible. It is constructed for a working pressure of 225 lbs. per square inch, and hydraulically tested to 450 lbs. per square inch, the inspection being carried out by the National Boiler and General Insurance Company. The boiler is dropped between the main frame, to which the bearer bars are bolted, and is placed behind the front axle. The foot-plate is below the main frame and the boiler is fired from below. This arrangement not only increases the tractive force and relieves the front wheels, but also enables the driver to see well in front of the vehicle. An auxiliary steam pump is provided, having a separate suction from the tank and a separate delivery and check valve on the boiler. Two safety check valves are fitted to the boiler, and are so constructed that they can be examined while the boiler is under steam, and, should the driver omit to open communication from the feed pump to the boiler, which under ordinary circumstances would mean bursting the pipes, the delivery will be discharged through a bye-pass directly before him. The automatic feed pump, which is worked off the end of the second motion shaft by means of an eccentric, is so constructed that the ram is not exposed to grit and dirt, whilst the stuffing box and valve boxes are easily got at. The engine is of the makers' improved, compound, link-reversing gear pattern, giving 25 b.h.p. at the normal speed of 450 revolutions per minute, and fitted with piston valves. The cylinders are 3½ in. and 7 in. diameter, by 6 in. stroke. A distinguishing feature of this engine is the arrangement of the valves and main cover. Only one cover is used for both cylinders and piston valves. This cover is arranged to serve also as the receiver, whilst supporting the multiplier which is used for admitting "live" steam to the low-pressure cylinder, the exhaust from the high-pressure cylinder being diverted to the atmosphere. A peculiarity of the makers' multiplier is that it also serves the purpose of a relief valve, thus preventing damage through accumulation of water in the cylinders. Stuffing boxes are not used. The steam regulator is a balanced valve attached to the high-pressure cylinder steam chest, by means of which the steam supply may be easily regulated or instantly shut off. The crank shaft, carried in two long bearings, together with the eccentrics, is cut out of a solid billet, and on one end of the shaft is a pinion engaging with a gear wheel on the second motion shaft. On a square in the middle of this shaft slide a pair of unequal pinions, either of which may be caused to engage with corresponding gear wheels carried on the crown of the compensating gear. The compensating gear shaft is the only one projecting through the casing, and carries a pinion at each end. A locking gear for putting the compensating gear out of action and causing both driving wheels to revolve together is provided. The whole of the gearing, which runs in a bath of oil, is of cast steel, machine cut, no keys being used in the transmission gear. The compensating gear shaft is carried in long bushed bearings attached to the casing, and these bushes are in turn carried in spherical bearings supported in cast steel brackets rigidly bolted to the main channel frame. The method of supporting the cylinder end allows a ball and socket motion, and it will therefore be seen that the engine, motion work, gearing, and shafts, being self-contained in a rigid casing, are kept in accurate mesh and alignment, whilst the method of suspension allows the main frame sufficient elasticity and spring without setting up internal strains and cross wind in the transmission gear. The boiler feed-pump and feed-water heater are also self-contained with the casing. Pivoted to the back axle under each side frame are two thrust rods, through which the drive is transmitted to the compensating gear brackets. Renold Silent chains are used, forming a flexible connection between the back axle and the compensating gear shaft. The main frame of the vehicle is of channel steel, braced and constructed so as to carry the whole of the machinery, boiler, and tanks. The wagon is supported on four laminated plate springs attached to the axles, which are of cast steel. The front springs are held to the axle in the usual way. The springs on the hind axles are so arranged that the spring for holding the leaves together is made to clip the axle and securely bolted. The advantage of this method is that there is a slight movement longitudinally and transversely without straining the spring supports. The water tank is at the rear, the bulk of the weight coming directly on the back axle. The capacity of this tank is about 145 gallons, which is sufficient for a run of about 15 miles on ordinary roads. The bunkers have a capacity of 12 cubic feet. The brake arrangement consists of steel cables lined with hard wood blocks and coiled round the brake drum. By means of a worm and wheel and a simple system of levers, pressure is applied or released at both ends of each cable simultaneously, thus securing the advantage not only of a very powerful brake but of one that is double acting and equally efficient when running either backward or forward. The whole of the operating and controlling levers are within range of the driver, who is also conveniently placed for firing up. The front axle is divided, the steering being on a modified Ackermann principle, giving a big angle of lock without reducing the stability of the wagon. To enable the engine, gearing, and tank to be examined the platform is hinged at the back end. A trailing bar is fixed to the main channels, also rollers behind the driving wheels.

CLASS D.—Vehicle No. D3. £465. Mann's Patent Steam Cart and Wagon Company, Limited, Canning Works, Leeds.—This vehicle is 13 ft. 6 in. long by 6 ft. 5 in. extreme width. The cart body is 6 ft. 5 in. long by 6 ft. 2 in. wide, and has 39.6 sq. ft. of platform area. It is con-

structed of flanged steel plates firmly stayed by angle irons. It can be tipped, and a windlass is provided for hauling it back again. The cart is a separate construction from the engine, and is carried on its own road wheels, 4 ft. diameter, with tires 5 in. wide, which are connected to and rotated by the engine road wheels of the same diameter and width of tire. The two coming close together make the width of tires 10 in. on each side of the engine. This method of coupling them together has been adopted for the reasons mentioned in the description of Vehicle No. D4. The general arrangement and design of the mechanical parts are the same as for Vehicle No. D4, except that in this case the engine is mounted on the top of the boiler, instead of on the extension of fire-box shell sides behind.

CLASS D.—Vehicle No. D4. £500. Mann's Patent Steam Cart and Wagon Company, Limited.—This vehicle is 18 ft. 6 in. long, by 6 ft. 4 in. extreme width. The lorry body is 12 ft. long by 6 ft. 3 in. wide, and has 75 sq. ft. of platform area. The frame is constructed of steel channels, firmly braced together by flanged steel ends and covered with wood flooring. The body is balanced and can be tilted in order to make the engine more accessible for adjustment and examination. This body is a separate construction from the engine and is carried on its own road wheels, 3 ft. 6 in. diameter, with tires 5 in. wide, which are connected to and rotated by the engine road wheels of the same diameter and width of tire. The two coming close together make the width of tires 10 in. on each side of the engine. The makers claim, in reference to the use of a trailer, that this method of connecting the light locomotive to the trailing vehicle more fully complies with the following Local Government Board regulations than if they were connected by a draw bar. It is also claimed that the above arrangement simplifies the requirements as to brakes, whilst the two wheels being side by side and close together the wide surface thus presented does not damage soft or weak roads as much as if the wheels were following each other in the same track. The boiler is of the locomotive type, with mild steel plates rivetted by hydraulic machinery. The working pressure is 160 lbs. per square inch. The shell fire-box side plates are extended a considerable distance rearwards so as to form a water tank and bed for carrying the engine. The engine is of the horizontal compound type, with cylinders 4 in. and 6½ in. diameter by 8 in. stroke. Reversing is effected by the makers' patent single eccentric reversing gear. The exhaust steam is taken into a super-heater in the smoke-box to render it invisible when emitted from the chimney. The fuel used is ordinary gas coke. All the gearing is of cast steel, the ratios provided giving speeds of 5 and 2½ miles per hour. Two brakes are fitted; one a band brake, acting upon a pulley on the intermediate shaft, and one upon the rim of the wheel of the lorry or vehicle. The reversing gear is also utilised as a brake. The vehicle has a differential gear, water lifter and indiarubber hose pipe, worm steering gear, pump, injector, lamps, tarpaulin cover, and the usual outfit of tools.

CLASS D.—Vehicle No. D6. £650. The Mechanical Transport Company.—This vehicle is 18 ft. 8 in. long by 6 ft. 6 in. extreme width across the platform, or over the hubs of wheels. The wheel-base is 10 ft. longitudinally and 5 ft. 6 in. (centre to centre of tires) transversely. The wheels are of solid timber segments, forced by hydraulic pressure upon wedges placed in a dovetailed groove around the boss, thus securing the centres without the use of bolts. The tires are closed on the periphery by hydraulic pressure. The steering wheels are 2 ft. 9 in. diameter by 4 in. on the tread, and the driving wheels 3 ft. diameter by 5 in. on the tread. The surface of the platform available for loading is 12 ft. 10 in. by 6 ft. 3 in., equal to 80 sq. ft. The height of the platform is 3 ft. 9 in. unloaded, and 3 ft. 6 in. when loaded with 5 tons. The boiler is of the vertical water-tube type, and is placed in front of the driver. The upper and lower annular multiples are made from weldless rolled steel rings, and a central steel steam and water drum is fixed across the centre of the upper multiple. The tubes, 192 in number, are of solid drawn steel, ¾ in. diameter, expanded into the multiples. The heating surface of the boiler is 90 sq. ft., and the grate area 2½ sq. ft. The working pressure is 250 lbs. per square inch, the test pressure being 500 lbs. per square inch. The fuel used is coke or coal, fed from the top. The safety valve exhausts into the chimney. A direct-acting automatic steam pump supplies the feed water, which is heated by the exhaust steam before passing into the boiler. The engine is a horizontal compound with two h.p. cylinders of 3½ in. diameter, and one l.p. cylinder of 5 in. diameter, with 5½ in. stroke. The three cranks are set at angles of 120 degrees to one another. Stephenson link motion is provided for controlling the h.p. valves, and a loose eccentric controls the l.p. valve. The engine is thoroughly encased, and runs in an oil bath. Power is transmitted from the engine by means of a pinion wheel, engaging with the outside rack of the compensating gear which is placed upon a counter-shaft. The extremities of this counter-shaft carry the two sprocket wheels, which are connected by chains to similar wheels placed in radius levers and supported upon the driving axle. The latter transmit the power through pinions engaging with internal racks which are bolted to the driving wheels.

The programme is exceedingly well arranged, and contains a great deal of information that is both useful and interesting. Diagrams have been prepared showing the gradients between Liverpool and Manchester via Warrington, and on the return journey via St. Helens; and between Liverpool and Blackburn via Wigan and Chorley, and the return via Preston and Ormskirk. Street maps of Liverpool, Manchester, and Blackburn are also given. The trials will be attended by representatives of four Government Departments, the High Commissioner for Canada,

and five of the Agents-General for the Colonies. A number of municipal corporations have also intimated their intention of sending deputations to watch the trials, whilst the pleasure side of automobilism will be represented by the Automobile Club, who have arranged to tour down to Liverpool, starting from Leamington to-day (Saturday).

FURIOUS DRIVING CASES.

BEFORE the Guildford Borough Bench, last week, Dr. Edward H. Lehwess, of London, was summoned for furiously driving a motor carriage in Spital Street, Guildford, on the 12th ult. Defendant sent a letter requesting that the case should be adjourned. The Chief Constable asked that the case should be gone into then, and the evidence was therefore taken. Sergeant Hall said that at one o'clock on the day in question he was in Spital Street, when he saw defendant coming along the London road on a motor-car. He was driving at about twelve or fourteen miles an hour. Besides foot-passengers, there was a brougham coming up the street, in which were Canon Grant and several others. Witness held up his hand, and defendant slowed up a little. As he passed, witness told him he was driving too fast. Just at this moment the brougham was passing, and the horse reared repeatedly. The driver, however, managed to keep the horse under control, and a serious accident was thus averted. The defendant slowed down considerably after passing witness, but almost immediately put on speed again. Afterwards witness saw defendant in the Angel Hotel, when the latter admitted he was going ten miles an hour, which he did not think excessive. Canon C. F. Grant said he was in the brougham, sitting with his back to the horse. He saw the motor-car through the window, and it was, in his opinion, going quite the pace the last witness had said. It nearly upset their brougham. Witness thought it only fair to say that the horse had been startled just previously by another motor-car. William Puttock, the driver of the brougham, said the horse reared three times. The motor-car must have been going at the rate of thirteen or fourteen miles an hour, and the pace was only a very little decreased as the car passed the brougham. Defendant was fined 20s. and costs.

At the Lincoln City Police Court, last week, Mr. George Dyke, trading as R. M. Wright, of Lincoln, was summoned for driving a motor-car at a furious rate, to the danger of the public, on Sunday, 19th May. The evidence of the prosecutor showed that on Sunday the Lincoln Friendly Societies held their annual church parade. They formed a procession in the G.N.R. station yard and marched towards the Cathedral, via High Street, Silver Street, and Lindum Road. When the procession arrived at the bottom of Lindum Road the defendant came round a corner about 150 yards away at a rate of fourteen miles an hour. The speed was so great that before the defendant could pull up he had run into the crowd. The car first struck two boys named Elston, knocking one down and running over him. The defendant then put on the hand-brake, but the car knocked a man, with a baby on his shoulder, four yards, and a young woman named Thompson was knocked down, and the car had to be lifted off her body. Defendant said he had four brakes on, but they all refused to act. He was not travelling above six or eight miles an hour. The defendant's wife said when the car went into the crowd it was only going about two miles an hour. The chairman said the case was very serious, and the defendant would be fined £5 and £1 10s. 6d. costs.

At the Bearsted (Kent) Petty Sessions, last week, Mr. Fritz Mulenkamp, of Brighton, was summoned for driving a motor-car at a greater speed than twelve miles an hour at Harrietsham on April 29th. Mr. Staplee Firth defended. William Bonner, engaged at a mineral water manufactory, said that he was engaged sorting bottles at the back of the Roebuck Inn, Harrietsham, when, hearing a motor-car approaching, he ran into the road to look to his horses, and held up his hand for the car to stop. It was not stopped, and in passing it knocked him over, hurting his hand and leg. He estimated the speed at over twenty miles an hour, and owing to that fact could not identify the occupants of the car. Several villagers agreed with the witness as to the speed of the car. How it was the defendant came to be summoned did not transpire, but Mr. Firth at once took the objection that there was no evidence that it was defendant's car, and without going further the Bench dismissed the case. They, however, declined to allow defendant costs.

A MOTOR-CAR DISPUTE.

At the Southwark County Court, on Tuesday, last week, the Clarkson and Capel Steam Car Syndicate, Ltd., of Great Dover Street, S.E., sued Mr. Wm. Edgar Muntz, of the Junior Constitutional Club, to recover £14 16s. for work done to a steam car. The defendant paid £5 into court, but counter-claimed for £12 18s. 9d., money paid by him for putting the motor-car into proper condition. Mr. Herron said that the plaintiffs fitted a condenser to the defendant's car in the way he ordered. It was quite experimental, and they did not take any responsibility in regard to it. They did all that was required of them, for which they had made a very fair charge, but the car would not work properly, and the defendant declared that he had paid

£12 18s. 9d. to get it to go. Mr. James Walter Kerr, secretary and manager to the plaintiffs, said the special part of his firm's business was the manufacture of a patented condenser for motor-cars, the chief merit of which was that the tubes were covered with a network of wire, which greatly increased the radiating surface. Witness had an interview with the defendant in regard to supplying one of these, but the defendant did not care about it being on the front of the car. Eventually defendant ordered a particular arrangement of his own to be carried out, which involved the placing of the pipes of the condenser under the frame of the car, and thus practically they were shut away from the air. Witness told him he could not tell how the condenser would act in that position, and he would not take any credit or blame for the result. He suggested that the cost would be about £8, but this would not include the fixing. The actual cost of the parts came to £7 12s. 6d. A man was sent to Harrow Road, where the car was, witness having given him full instructions in the hearing of the defendant. The man's instructions were, however, altered during the job, and altogether forty-five hours were spent upon it. When the invoice was sent in the defendant replied that he had been told that the cost of the whole job would not be more than £8, and further that it was not completed as the machinery would not act. Chas. Talbot, the fitter, said the defendant gave him fresh instructions during the course of the job, and he carried them out to the best of his ability. Mr. Thomas Clarkson, managing director of the plaintiff firm and inventor of the condenser, said defendant was distinctly given to understand that he would have to take all the responsibility of the work which was quite experimental. The cost of the condenser fitted in its proper place would have been about £9, and this would have been guaranteed to act perfectly. The defendant said he called on the plaintiffs as professional experts fully acquainted with hot water circulation, and consulted them as to whether their cooling tubes would act lengthways. He received an answer in the affirmative. He also asked whether the water would cool sufficiently in the length of pipe he proposed, but was told that that was uncertain. There was no question as to the proper circulation. The work was carried out without any supervision on the part of the plaintiffs and without any interference on his part, but when he put the motor to work he was amazed to find that whilst the water in the tank got boiling hot that in the tubes remained cold. This he discovered was due to the fact that the in-take and out-take pipes had been fixed at the same level and thus the water would not circulate. The plaintiff refused to alter this until he paid them for what they had done, which was nearly double the agreed price, and he was obliged to put the car in the hands of Messrs. Frazer and Frazer. They altered the pipes and the water circulated perfectly. He had to put in some more cooling tube, but that he would not have objected to pay the plaintiffs for had they done it. After a hearing which occupied nearly the whole day, his Honour found that the defendant did not order the in-take and out-take pipes to be fixed as they had been. Upon the whole he gave judgment for the plaintiffs for £12 without costs, and for defendant on the counter claim for £8, but with costs. Judgment was entered accordingly.

THE FATAL ACCIDENT AT KNARESBOROUGH.

THE adjourned inquest on Frederick George Oxby, of Knaresborough and Doncaster, who was killed recently at Knaresborough by jumping out of a runaway motor-car, was concluded last week. The coroner, who read the evidence, said neither the police nor himself proposed to call any further evidence. He then summed up, and reviewed the evidence taken previously, pointing out that the deceased knew the condition of the car and its brakes, and the requirements of the Light Locomotive Act. He said that if the deceased had only retained his seat he would have been unharmed. The jury returned a verdict of "Death by misadventure."

WE understand that a public service of motor-cars is shortly to be started in Reading, ten Daimler vehicles having already been acquired.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JUNE 8, 1901.

[No. 118.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ARRIVING in York on Friday, last week, one of our correspondents saw Mr. J. D. Siddeley on his dark green Daimler, and a few minutes later another car whizzed by. There is not a town or considerable village in the county of broad acres where a motor-car is not to be seen, and at Huddersfield Dr. Norman Porritt is using a Locomobile in his daily practice with much comfort and a great saving of time. At Leeds, Sheffield, Ilkley, and Scarborough we have lately had similar evidence of the popularity of the automobile in a county which is famous for its horses and cheerful in its agricultural outlook. Further testimony comes in a long correspondence which is going on in the leading daily papers of Yorkshire wherein many people have sought to defame the motor-car. But the days of attack without defence have gone and the letters of irritated drivers of horses have called forth some vigorous replies from automobilists.

Doctors and Cars.

DOCTORS continue to correspond in their professional papers on the merits of steam, petrol, and electric automobiles. Having been converted to the motor-car in general, they are now discussing the merits of particular vehicles with a zest and attention to technical details which must be gratifying to all interested in the growth of the industry. Dr. Reginald Groves, of St. Ives, is using a New Orleans car in his country work, and says that the only time required in connection with his journeys is two minutes to oil the engine before starting and fifteen minutes every 70 to 100 miles to go over the whole machine and the bearings. This is a point often neglected by motorists; but one which is highly essential to the easy running of the vehicle, to say nothing of the advantage in durability of the working parts. Dr. Groves calculates the cost per mile is $\frac{1}{2}$ d. for petrol, electricity, and lubrication, and he allows 2d. per mile for repairs of tires—a sum which he has not reached, but which he recommends as a fair estimate in judging the cost of automobilism. As a matter of fact, the experience of Dr. Bruce Porter, of Windsor, shows that, in his case, the repairs during a year and three months' use cost only $\frac{1}{2}$ d. per mile.

Numbering Motor-Cars.

A GENTLEMAN, whose excessive modesty has prevented the publication of his name, has been writing to the papers advocating that motor-cars should be numbered. He confesses to the ownership of a car and acknowledges that he is "financially interested in motor companies," and appears to regard it as highly creditable that he should urge the numbering of automobiles. We should have liked him better had he had the decency to sign his name and not to set himself at variance with the great majority of motorists under the protection of a *nom de plume*. This suggestion is trotted out every now

and then as though it would solve the problem of speed and cure the evil temper of horses that persist in shying at mechanical vehicles, and generally misconducting themselves on the public highway. Cannot the advocates of numbering, labelling, etc., recognise that these problems will be settled in due course by the operation of the law of common sense. Horses are becoming accustomed to automobiles, and motorists are daily growing in expertness with regard to the driving of vehicles, and in that combination lies the safety of the public—a safety far more assured than would be that relying on an iron plate reducing cars to the position of hansom cabs.

Motor-Cars v. Tramways.

THE extremely unsatisfactory state of the tramway question at Darlington has led a gentleman of that town to come forward with a good suggestion, in the local Press. Darlington, he states, has a population of 44,500, and therefore cannot be expected to keep a Municipal tram service going as a paying concern, which would, according to the figures of an expert, require to carry 56,000 passengers a week to cover expenses. Half the capital outlay of a tram service is swallowed up in laying down permanent way. Have a motor-bus service, municipal or private, at half the original cost, and not necessarily bound to any particular route, by any hard-and-fast lines, is his wise conclusion, and a conclusion which local authorities elsewhere, perplexed with the problem of transporting a not too numerous population, would do well to consider.

The Taxation of Motor-Bicycles.

SEVERAL correspondents reply to the question raised by W. S. L. in our last issue with regard to the taxation of motor-bicycles. Both motor bicycles and tri-cycles must pay the tax of 15s. for a two or three-wheeled carriage. Quadricycles come under the classification of a four-wheeled carriage and have to pay a tax of two guineas. Seeing that motor-vehicles are subject to identically the same conditions as horse-drawn carriages so far as the carriage tax is concerned, it appears only fair and equitable that such vehicles should be exempt from taxation if used exclusively for business purposes, as is the ordinary horse-drawn vehicle. We understand some of our correspondents are in communication with the Inland Revenue Office on the subject, and shall be glad to hear as to the result of their inquiries. It should, however, be noted that a carriage is only exempt from the tax if it is never used for any other purpose than trade, and that if a motor-bicycle was ever used for a pleasure trip it would be unable to escape taxation, the limitation to "business purposes" being very keenly regarded.

Electric Motor-Cars.

M. C. JEANTAUD, whose name is associated in France with the infancy and rise of motor-cars, particularly those of the electrical type, gives some interesting facts and opinions in his preface to a new book on electrical cars that has just been published in Paris. The future of electric motor-cars, he says,

depends on improvements in accumulators, in which for a few years past no great progress has taken place. If this state of things were to last, he admits, the prospect for electric vehicles in towns would be a gloomy one, but ten thousand minds throughout the world are on the alert. The discovery of a light and lasting accumulator able to propel a carriage a distance of sixty or seventy miles without recharging, and weighing not more than 10 or 15 per cent. of the total weight of the car, will bring its inventor a fortune of several millions. M. Jeantaud does not think that the next improvements in accumulators will be due to chance. Although everything has not yet been got out of lead, he does not think that this metal will give the ideal accumulator, nor does he believe in gas accumulators, or thermo-electric batteries. He is rather inclined to believe in an apparatus producing electricity direct, weighing not more than two hundred-weight, and yielding a current of 3,000 volts.

M. Henri Farman and his Racers.

THE accompanying illustration shows M. Henri Farman on the 12 h.p. Darracq car in which he took part in the recent race meeting at Nice. M. Farman has competed in only three races, and has in each case come in first on the car shown. These races were, two at Pau, in the month of February last, distance about 246 miles, at an average speed of forty miles an hour, and a race at Nice in the month of March last, distance

M. HENRI FARMAN ON HIS 12 H.P. DARRACQ RACING CAR.

284 miles, in which he arrived first in spite of unfavourable weather and mountainous roads. The new Darracq car which M. Farman will drive in forthcoming races has a four-cylinder motor of 28 h.p. The total weight of the car is about half a ton. It is geared to attain a speed of eighty miles an hour.

Coals of Fire.

It's nice to find that the motorist bears the persecuting P.C. no malice. A pleasing illustration of this comes from Darlington, where the other day a fishmonger was charged with being drunk whilst in charge of a pony and trap. The latter went along at a great speed, twenty miles an hour, one side of the pony, and one wheel of the trap on the pavement all the time. The bitterest enemy of a motor-car could not have accused it of doing worse. Of course, the policeman could not catch the pony and trap, but a motor-car coming along, he accepted the hospitality of the driver, and went in chase, finally landing his quarry at the police-station, where the fishmonger was duly fined. We hope that an account of the incident will find its way into the official organ of the police force, and that

some members of the force will call it to mind when tempted to break the ninth commandment.

Motorphobia.

WITH the approach of the dog-days, motorphobia is becoming rife. Our contemporary the *Rural World* gives relief to one of the afflicted, who asks through its columns, "Why should these new terrors have the monopoly of the roads with their noise, foul smell, and dangerous speed? The police say they cannot control the motors, as they are unable to overtake them. Surely something can be done to protect peaceable rate-payers in their undoubted rights to the safe usage of the high roads." We may be prejudiced, but we do think that the owner of a motor-car has as much right to the use of highway or by-way as any other ratepayer. As to police control, it would cease to exist altogether in some districts were it not for the fines and costs levied on the unfortunate motorist who has the hardihood to traverse them.

Motor-Cars and the U.S. Signalling Corps.

THE United States Signal Corps has been experimenting for considerably over a year with three motor-vehicles, for the purpose of determining their exact value in field service. One of these vehicles has been in actual service for several months at Manila, and the other two have been used experimentally at Fort Myer, Va. It was the original intention of General Greely, who is in charge of the corps, to procure for these experiments automobiles having the three different kinds of power—electricity, steam, and petrol—in order to test them all. This plan, however, was afterwards changed, and three electric-cars were purchased, because of the belief that their batteries would make them of great service in operating field telegraph or telephone lines. We understand, however, that it has now been decided to extend the experiments to include vehicles operated by other kinds of power, and that recently one steam and two petrol cars have been ordered. These vehicles are, we believe, to be of special design, in accordance with certain specifications of the U.S. War Department.

One Disadvantage.

LIKE all good things, the motor-car has its disadvantage, not to its happy owner, but to those who may be taken at a disadvantage by its arrival at an unsuspected hour of night or day, absolutely inconsistent with any other recognised mode of transport. A surprise of this order, but a pleasant one, occurred at Chantilly last Sunday. King Leopold of Belgium was there, in time for the races, though not due in Paris till the next morning. Acting on a sudden impulse His Majesty took train to Namur, where his motor-car was in waiting, and drove himself the greater part of the way to Chantilly. Of course it was nice and friendly of King Leopold to drop in unexpectedly; but what would the officers of a certain military Power think if their energetic ruler took to paying surprise visits on his swift and silent motor-car?

Accidents in France.

THE monthly report of accidents caused by various means of transport in France during March, published by *Le Vélo*, shows 816 caused by horses, of which 77 were fatal. Railways come next with 9 deaths and 76 injuries. Bicycles were responsible for 3 deaths and 66 injuries, and motor-cars for 3 deaths and 29 injuries. Looking at the figures another way we find the horse responsible for 83.70 per cent. of the fatalities, railways 9.78, motor-cars 3.26 and cycles 3.26. The horse heads the list of injuries with 81.21 per cent.; railways come next with 8.35, cycles next with 7.25, and motor-cars last with 3.19. It is really quite surprising to find the motor-car so far down this painful list after all one hears about its bloodthirsty propensity, particularly when it is remembered that in France the pace allowed is 7 miles more on the open, and 4½ miles more

through villages and towns than in this country. But what about our friend the horse? The motor-car will rob him of the conduct prize yet if he does not mend his ways.

Motor-Cars Popular in America.

THE popularity of motor-cars in America may be gauged by the fact that a studious correspondent, who has been busily engaged on Sundays counting the pleasure vehicles which pass up and down the Broadway, Harlem, has discovered that the numbers of horseless and "horse" vehicles are about equal. Continuing, he says: "As fully three-fourths of the filth of the streets is caused by horses, think how much cleaner the streets and how much purer the air will be when horse traffic is forbidden in the main thoroughfares. By comparing the number of people the large, clean, rapid-moving trolley carries as against the little, dirty, odorous, slow-moving horse-car (of which New York still has many), one can readily see that when applied to merchandise much more can be transported, and that without congesting the streets as now."

Points of Recommendation.

A USEFUL bit of criticism on the way in which makers of motor-cars seek to attract buyers comes from Mr. Labouchere, who points out that "most of them dwell upon their cars having beaten other cars in races." This, however, is a point that does not appeal to everyone—in fact it will only interest a limited number. The doctor, tradesman, or carriage owner does not want a racehorse; nor does the ordinary motorist seek a vehicle in which speed and lightness cause comfort and convenience to be obscured. Accessibility and simplicity of working parts, proof of durability, certainty of easy running, reasonable price, and general convenience are merits that appeal more strongly to the average inquirer than bald facts as to abnormal and unnecessary speed.

An Automobile Tournament.

A GRAND automobile tournament is being organised in connection with the Pan American Exhibition which has just been opened at Buffalo, N.Y. The tournament will take place in the Stadium during the week beginning Sept. 16, and will consist of sports and trials to test the skill of the *chauffeurs*

THE MEET OF THE READING AUTOMOBILE CLUB.

[Walton Adams, Reading.

The Reading Automobile Club.

AT the invitation of Mr. C. E. Keyser, J.P., the Reading Automobile Club held a meet at Aldermaston Court on the 18th ult., and the event proved a complete success. Mr. Keyser and some of his family went out to Reading on purpose to join in the run, and they all expressed themselves as delighted with the mode of travelling. Seventeen cars put in an appearance, conveying about fifty members, including the Mayor of Reading, Mr. Arthur Russell and Miss Russell, Drs. Major and Price, Mr. Paxton Petty, and many others. The meet was a most enjoyable one, and the variety of up-to-date and handsome motor-vehicles was much admired and commented upon. The vehicles included several 5 h.p. Renaults, a 12 h.p. racing Darracq, a 6 h.p. Darracq, a De Dion voiturette, two Accles-Turrells, two Benz cars, a Baby Renault, Ariel, De Dion, and Components trikes, and many others. In the course of a few words of cordial welcome Mr. Keyser expressed his belief and interest in the automobile movement, and, as a member of the County Council, declared that he would raise his voice against any harassing restrictions. After a pleasant ramble over the Park the members returned to Reading via Burghfield Common, no hitch or breakdown of any kind occurring to any car either upon the outward or homeward journey.

and the mobility and economy of the various types of motor-vehicles. The culminating feature of the week will be a competitive speed contest over the famous Buffalo-Erie Road, open to self-propelled vehicles of all types and countries. A great many Club runs have been planned with Buffalo as the objective point, the most important of which will be the tour or endurance demonstration of the Automobile Club of America from New York to Buffalo, a distance of about 460 miles. This run will be made during the week preceding that of the tournament, starting from New York on September 17.

Launches v. Motor-Cars.

DISPLACEMENT of one industry by another is a common tendency in industrial development, and it is being reported that the steam launch builders of the Thames are bewailing the rivalry of the motor-car. The patrons of the river launch have taken to the automobile with an eagerness that has caused the older builder to be ignored; hence his tears. It may be that there is a temporary reaction in favour of the automobile; but the Thames will flow on as hitherto, and so long as the glorious river remains so will launches and boats be found on its waters. Those who fancy motor-cars will drive the launch into some musty museum as a relic of riparian pleasures show a singular want of thought. What launch builders must do is to

bring their designs up to date, and by providing better launches, etc., do for those who love the river what the automobile is doing for those who prefer the road.

"What's in a Name?"

AN American contemporary expresses disgust at the indiscriminate way in which English people use the word "car" in connection with all forms and conditions of motor-vehicles. All sorts of authorities are quoted to prove that the word is only applicable to small carriages of burden, vehicles for a railway, circus, or funeral. Without consulting one single Lexicographer we venture to defend the use of the word "car" as an appendix to "motor" in a broad and general sense, inasmuch as it is undoubtedly a corruption of the word carriage, which stands for anything on wheels which carries anything, dead or alive—a gun, a baby, its father or mother, goods, dry or wet, light or heavy. It may, however, interest our contemporary to learn that at the Liverpool heavy motor-vehicle trials held this week there were entered motor-lorries, wagons, and drays. Motor-buses and vans are also known in this country, and it is to distinguish between these heavier vehicles of commerce and the lighter ones of pleasure that the word "car" is generally used.

Local Law.

A RECENT decision of the Aberdeen Justice of Peace Court is curious, and would be, if final, serious. The Court found that a motor-lorry with a trailer attached was a locomotive, and must, therefore, conform to the Locomotives Act as regards speed, hours of running, and the number of men in charge. Supposing such a finding to be correct, the Liverpool Trials of this week have all been run on a wrong basis. A man should have marched in front of each vehicle with a red flag, and the speed of the vehicles should not have exceeded five miles an hour. Fortunately, the finding of the Aberdeen Baillies is not like unto the laws of the Medes and Persians, and we are glad to hear that the Speedwell Motor-Car and Cycle Company, to whom the maligned vehicle belongs, have lodged an appeal.

Motor-Cars in War.

MR. A. G. HALES, the well-known war correspondent, has been ventilating his views on motor-cars in war through the columns of *Our Candid Friend*. As a means of transport he has nothing to say about the motor-car, probably because its advantages in this respect are too fully recognised to call for comment, though unfortunately not so fully adopted. It is the armoured motor-car, able to go anywhere that cavalry can, that Mr. Hales advocates. His illustrations remind us somewhat of the old Roman tortoise, excepting that just a small portion of the wheels on which it should run are exposed, not the legs of its bearers. To quote Mr. Hales:—"Each car should be built to carry not more than six riflemen and one Maxim gun. The sides of the car should be perforated with horizontal loopholes for rifles, the front, rear, and centre being loopholed for a Maxim gun. The car should be pointed both front and rear to avoid atmospheric obstruction to speed, and to throw off both rifle and gun fire."

Invicta!

WHILST Lancashire is still testing the practical value of the motor-car for commercial purposes, Tunbridge Wells has gone boldly into the matter and inaugurated a service from London, which commenced yesterday (Friday). Disgusted with the vexatious railway delays to which their town has been so long subject, the leading tradesmen have agreed to support a scheme brought forward by the London and Counties Distributing Company. Starting from the Spur Inn, Borough, at night, the cars, of which there are to be five, will each convey eight tons of goods, five on the car and three on a trailer. Arriving at Tunbridge Wells in the small hours of the morning, the goods

will be distributed conveniently early, and at a cost below that of the slower railway. Ten shillings per ton is the rate fixed, smaller parcels being accepted *pro rata*, sixpence being the minimum for those of less than twenty-eight pounds. Kentish fruit growers, and growers of fruit elsewhere for that matter, who are given to complaining that it does not pay to pick their fruit should follow the example of Tunbridge Wells—start a motor-car service which will not only collect their fruit but deliver it in London in half the time and at half the cost of the railway.

The Steam Motor-Truck.

IN the last issue of the *Engineering Magazine* Mr. James Grieve Dudley asks whether from the rich man's plaything (i.e., motor-car) cannot be evolved a motor-truck which may successfully supersede horse traction for heavy loads on a basis sound commercially and practicable mechanically. There is nothing new in the question, though there are many points worth consideration urged by the writer in his interesting sketch of a universally adopted type of motor-truck, equally reliable amongst the sands of Florida as on the rocky heights of the far North-West. That the motive power must be steam he takes for granted, and on pure water to generate this steam he insists, at the same time deploring the growing tendency towards so-called boiler-compounds. As such a vehicle would far eclipse anything horse-drawn in staying power the writer thinks high speed of secondary importance, and advocates a driving gear without mechanical speed-change gear. As to transmission of power, the writer considers that the chain and sprocket must be rejected. Steering should be done by steam power, be self-locking, and require no muscular effort on the part of the driver.

A WELL-TO-DO citizen of Newton, Mass., formerly owned six horses and a number of carriages. A few years ago he bought a motor-car, and last year a second. He has now sold all his horses and carriages and uses the automobiles exclusively.

A NEW steam vehicle company has been incorporated in Indiana with a capital of £20,000. It will be known as the White Steam Wagon Company and will manufacture heavy steam wagons in Indianapolis.

LLANDUDNO has started a daily motor-car service to the Snowdon district, which allows sufficient time for the ascent of the famous mountain, obviates the painfully long cross-country railway journey to its base, and beats the coaches on their own ground.

THE overland automobile trip from San Francisco to New York, undertaken by Messrs. Alexander Winton and Charles B. Shanks on a 9 h.p. Winton Car, began at 7.15 a.m. on Monday, the 27th ult., from the Ferries Building, in San Francisco. A packet from General Shafter will be delivered to General Miles in New York. The route taken will probably measure four thousand miles.

UNDER the title of "Three Men in a Vehicle," the St. Louis Motor-Carriage Company, of St. Louis, Mo., U.S.A., publish a booklet, which can hardly be called a catalogue or price-list, because it contains no reference to the company's cars, excepting what is to be found in the valuable collection of testimonials from all sorts and conditions of men, which occupy alternate pages with the story of the three men and their vehicle. As for the story, it has been told before in the *Motor-Vehicle Review*, and is a most interesting account of a run from Boston to New York on one of the company's runabouts.

THE Straker Steam Vehicle Company, Limited, has been registered, with a capital of £12,000, to acquire from S. S. Straker the benefit of certain existing inventions belonging to him in connection with steam motor-vehicles, and to carry on the business of mechanical and electrical engineers, etc. The number of directors is not to be less than two nor more than four; the first are S. S. Straker and L. R. L. Squire. The registered office is at 9, Bush Lane, Cannon Street, E.C.

The Liverpool Heavy Motor-Vehicle Trials.

THE interest of the automobile world has this week been centred on the heavy motor-vehicle trials carried out in Lancashire under the auspices of the Liverpool Self-Propelled Traffic Association. The object of the trials and a description of the competing vehicles was given in our last issue.

The Judges of the trials are Sir David Salomons, Professor H. S. Hele-Shaw, Mr. Everard R. Calthrop, M.Inst.C.E., Mr. S. B. Cottrell, M.Inst.C.E., Mr. Boverton Redwood, and Mr. Henry H. West, M.Inst.C.E. Mr. E. Shrapnell Smith has again proved a most enthusiastic honorary organising secretary, and he has been most ably assisted by Mr. Ernest A. Rosenheim, B.Sc., assistant hon.

MESSRS. MILNE'S PETROL LORRY.

secretary; Mr. Basil H. Joy, hon. press secretary; and Mr. Henry Fowler, Assoc.M.Inst.C.E., hon. controller of records. There was also a good staff of senior observers, depot and road observers, whose services proved indispensable.

The trials throughout the week have been followed by about twenty different motor-cars, including Mr. Critchley's 16 h.p. Daimler, Mr. A. J. Boulton's 12 h.p. Cannstatt-Daimler, Mr. H. Edmund's 9 h.p. Daimler, Mr. J. Holder's 16 h.p. Napier, Mr. Mark Mayhew's Panhard and Dr. Muhlenkamp's 8 h.p. Panhard, Mr. Critchley's car has been used throughout the tests by the Judges, while the other vehicles have been made use of by the very influential official deputations that have followed the trials. The latter included Colonel C. H. Scott, C.B., R.A.; Lieut.-Colonel F. B. Elmslie,

THE SIMPSON AND BIBBY STEAM WAGON.

R.A.; Lieut.-Colonel H. C. L. Holden, R.A., F.R.S.; Lieut.-Colonel R. E. B. Crompton, R.E.E.E.; Captain F. Lindsay Lloyd, R.E.; and Captain C. H. H. Nugent, R.E., representing the War Office; Mr. Francis Salisbury, Postmaster of Liverpool, and his assistant representing the Post Office; Colonel C. H. Scott, C.B., R.A., Ordnance Consulting Officer for India; and Commander G. T. Wingfield, R.N., Superintendent of the India Store Department, representing the India Office; Mr. A. E. Brooke-Hunt, representing the Board of Agriculture; Mr. G. W. Willcocks, M.Inst.C.E., of the Local Government Board; and representatives of the Canadian and Victorian Governments, the Manchester Chamber of Commerce, and other bodies.

As stated in our last issue, thirteen entries were altogether received in the four classes. The following eleven vehicles put in an appearance:—

CLASS A.

Official

No.

- A 1. } Geo. F. Milnes and Co., Limited, Motor Department, "Motoria,"
A 2. } 17, Balderton Street, Oxford Street, W. Tare weight,
1 ton 19 cwt. 2 qr.

THE MANN STEAM CART.

CLASS B.

Official

No.

- B 1. The Lancashire Steam Motor Company, Leyland, near Preston.
Tare weight, 2 ton 19 cwt. 2 qr.

CLASS C.

Official

No.

- C 1. The Thornycroft Steam Wagon Company, Limited, Chiswick and Basingstoke. Tare weight, 6 ton 8 cwt.
C 2. C. and A. Musker, Limited, The Brook, Liverpool—oil firing. Tare weight 3 ton 16 cwt. 2 qr.
C 3. C. and A. Musker, Limited, The Brook, Liverpool—coke firing. Tare weight, 3 ton 14 cwt. 3 qr.

THE MANN STEAM WAGON.

CLASS D.

Official

No.

- D 1. The Thornycroft Steam Wagon Company, Limited. Tare weight, 3 ton 16 cwt.
D 2. T. Coulthard and Co., Limited, Cooper Road, Preston. Tare weight, 3 tons 14 cwt.
D 3. } Mann's Patent Steam Cart and Wagon Company, Limited,
D 4. } Canning Works, Dewsbury Road, Leeds—cart (tare, 4 tons) and wagon (tare, 3 ton 19 cwt. 3 qr.) respectively.
D 5. Simpson and Bibby. Tare weight, 4 ton 1 cwt.

Leamington was the appointed meeting place for those members of the Automobile Club who intended motoring down to Liverpool, but we are afraid that not a single member of the Club stayed at the Regent Hotel on Saturday night. True, Mr. Mayhew drove down from London, but he "put up" with a friend in the town. For ourselves, we grate-

fully accepted a seat on the beautiful new 16 h.p. Daimler, which attracted so much attention at the recent Exhibition, and journeyed to Coventry to meet Mr. J. S. Critchley, one time manager and now director of the Daimler Company. Assembled at Coventry were Captain Lloyd, one of the representatives of the War Office, who had come down by road on an M.M.C. Panhard, driven by Mr. Seal; the car, which had four passengers up, and also carried two heavy portmanteaux, had a very fine run down from London without accident; Mr. Muhlenkamp and party on a 6 h.p. Panhard, having ridden from Brighton; Mr. Oliver Stanton, and others.

Sunday morning was bright with sunshine, and it was intended an early start should be made—so

winding that fast travelling was out of the question. That did not matter, however; they were very beautiful, and their leafy shadiness was much appreciated. The first stop—necessitated by taking a wrong turning—was made at a pretty little village, by a river-side, about forty miles on the journey. On a restart being made it was found that the road to Stone was newly metalled, and some of the patches were over a hundred yards long. A bent stay rod, due to the fierceness of the clutch, caused a long delay, but matters were remedied by the aid of a jack and a block of wood. Stone—our luncheon place—fifty miles on the way, was reached shortly after one o'clock, but not before we had bent both stay rods again. A blacksmith this time was required, and it was not till four o'clock that we

THE HILL-CLIMBING TRIALS AT EVERTON BROW.

[J. Watkins, Liverpool.

nine o'clock found us at the Daimler Works—but it was past ten o'clock before we could tear ourselves away from the attraction of examining the many good things there to be seen. Our fellow passenger was Capt. Lloyd, R.E., and a companion we would all wish to have when there are adjustments required. Notwithstanding the number of firms at present manufacturing cars at Coventry, it is a fact that on Saturday night there was an absolute famine of petrol in the town, and cars had to go to Stonebridge, where the landlord of the Inn was reputed to keep a stock of nearly forty gallons, which we were told he retails at 15d. a gallon.

The roads were in beautiful condition, but for the first twenty-five miles the Warwickshire lanes were so narrow and

were on our way again to Chester, where a short stop was made, only to run into the stable yard of the Grosvenor to see if there were any other cars. Birkenhead was reached at 6.20, the day's run of 110 miles having been most thoroughly enjoyed. For the crossing of the Mersey a special ferry had been chartered by Mr. Smith, but, alas! it was only used for the carriage of two cars, Mr. Critchley's and Mr. Mayhew's 24 h.p. French Panhard; this latter, however, arrived a few minutes in front of us, we having followed his tracks for the last fifty miles. On the ferry was a deputation of the Liverpool Self-Propelled Traffic Association to welcome us, and right merry were all—while waiting to see if other cars would arrive. The dinner hour passing, it was decided to cross the

river, and then to send the ferry boat back again to wait for stragglers. About ten o'clock the train party from London arrived and the Adelphi Hotel then rapidly filled with motor-men.

On arriving at the scene of operations on Monday morning it was found that of the thirteen entries, there were two absentees, D6, the vehicle of the Mechanical Transport Company, and C4, the second vehicle of Messrs. Simpson and Bibby. Of the eleven vehicles which took part in the hill-climbing trial at Everton Brow, the two entered by Messrs. C. and A. Musker, Ltd., of Liverpool, were withdrawn after having reached the foot of the Brow—one essayed to rise, but did not get so far as the pavement. In excuse it may be mentioned that both the vehicles only left the works for the first time on the Saturday previous. With Mr. Smith, punctuality is a *sine qua non*, and therefore at ten o'clock, the time set down on the programme, the first of the vehicles was sent forth on its journey up the hill. We may mention that the vehicles were all stored at the George's Docks and left that dépôt in procession at nine o'clock, Monday. Accompanying the vehicles was the huge 12 h.p. Cannstatt-Daimler, belonging to Mr. Boulton, which travelled up and down the hill with every vehicle, and carried some of the officials. All others had to walk up and

big car—a grand vehicle—C1, was started; and went through the trial well, although the wheels slipped a trifle in Rupert Lane. D1 was equally satisfactory. Milne's A2 travelled up the hill very fast, in fact, made the fastest journey of the day, stopped and started easily; came down the hill very fast and consequently took some distance to pull up. Milne's A1 performed well, but skidded a trifle at the Lane. This was the last car to go up, but its services were further required by the weary pedestrians to carry them back to the Adelphi—about twenty passengers availing themselves of the opportunity.

Directly after luncheon the vehicles were put through various manoeuvres at the docks and some of the drivers were remarkably smart in the handling of their wagons. Rain was descending most of the time the vehicles were exhibiting the ease with which they could be handled, and the morning, which had been dull and cold, was succeeded by alternating showers and weak sunshine in the afternoon.

Four o'clock once again found us at Everton Brow, the attendance, which had been but slight in the morning, being increased to a large crowd in the afternoon. The first of the laden vehicles to start was Milne's A2; then followed the Lancashire B1; Coulthard D2; Thornycroft D1; Mann's D4; Simpson and Bibby's D5; Mann's D3; Thornycroft's C1,

A2.—The Milne's Petrol Lorry.

B1.—The Lancashire Wagon.

THE HILL-CLIMBING TRIAL AT EVERTON BROW.

down each time, as it was really necessary to do so, because the two steepest portions of the rise were found to be shortly after the start and at the top of the Brow in Rupert Lane. The Coulthard was the first away, and stopped and started on the up-grade, showing great brake power down-hill. In turning into Rupert Lane, however, the lorry stuck for some time, but ultimately reached the top all right. The wheels of the Lancashire wagon skidded a trifle and had some little difficulty in starting, but afterwards proceeded all right.

Mann's D4 travelled up the hill at a great pace, and in the stopping test showed to great advantage; the brake power was also good. Mann's D3 also went up strong, but had to make three efforts to start—at each effort jumping back a couple of feet—but at last going off well, but "jibbed" a bit in turning corner into the Lane. Simpson and Bibby's D5 came up slowly, stopped, and restarted well; stuck at corner in Rupert Lane, back wheels slipping round, and ran back about a dozen feet, travelled a few feet, then stopped again; back wheels flying round and vehicle skidding. In coming down the hill when the brakes were applied this vehicle slewed round a trifle. The next vehicle was one of Musker's, but this did not travel far, although some time was spent, and half-an-hour's delay was caused in an effort to get it to go. Ultimately the Thornycroft

and Milnes A1. All travelled up well and went through their trials without incident, the whole proceedings of the afternoon being carried out briskly and with brilliant success. At one time the granite sets got rather greasy after a shower, but this did not seem to affect the travelling to any appreciable extent. The following are the official records of the day's trials:—

Gradient varying from 1 in 18 to 1 in 9.

belonging to the Liverpool Corporation, and the other to the Mersey Harbour Board—were seen at work, laden, on the road, while a couple of light cars were *en panne*. Mr. Boul's car, with Messrs. Worby Beaumont, F. R. Simms, and a full complement of passengers on board was soon passed. At Aigburth we came up with the Simpson and Bibby wagon, with five tons on board—travelling slowly and somewhat in distress, the rear axle having been strained by overloading, causing the slipper brakes to bind on the wheels. This trouble ultimately proved fatal, and the vehicle "gave up" at Speke. The next vehicles seen were the two Mann cars, both travelling famously. Our first stoppage was at a railway bridge, where the Thornycroft D1 was found stationary, having a hot bearing. Several cars passed, including Mr. Holden on his 16 h.p. Napier. We shortly afterwards came up with the third Thornycroft, used for the purpose of carrying the luggage of the party. Several passengers were also carried, including Mr. Spurrier, of the Lancashire Steam Motor Company. Mr. Mann also had a third vehicle engaged in carrying luggage, etc. The big Thornycroft, the Lancashire and the Coulthard were all soon passed and Widnes reached, where the Mayor held a reception and entertained the party. The townsfolk also turned out in numbers, as, indeed, did the public in large crowds all along the route, the scene reminding us

THE VISITORS AT THE TOWN HALL, WARRINGTON.

[T. Birtles, Warrington.]

Tuesday opened fine and bright, and nine o'clock found all interested at the George's Depot, where a lively scene presented itself. The heavy vehicles were laden with merchandise and manoeuvring about to get into position, and by ten o'clock all had left for their journey to Manchester, via Widnes and Warrington. Appended is a tabular statement of the loads carried by the competing vehicles:—

Vehicle.

A1.—1½ tons of leather, for J. H. Fleming and Co., Ltd., Warrington, to be delivered in Manchester.

A2.—1½ tons of Pratt's M.C. spirit in cases, for Anglo-American Oil Company, Ltd.

B1. } 67 bags of flour, collected from West Hornby Dock, from D2. } Kruger, Darsie and Co., for W. T. Sutcliffe and Co., Manchester.

D4. } Each wagon carried 4½ tons.

C1.—Olive oil soap in cases for J. Smith and Co., Ltd., Manchester. Weight, 5 tons 11 cwt., 1 qr. 17 lbs.

D3.—45 bags of cement from Ingram and Clarke, for W. G. Armstrong, Whitworth and Co., Openshaw, Manchester, 4½ tons.

D5.—60 bags of sugar for Clifton's Brewery, Ltd., Stockport, from Graham, Son and Hay.

D1.—3½ tons of Red Maid soap from the United Alkali Company, for Manchester.

NOTE.—With fuel supply for two days' run, observers and passengers all these loads were increased by half a ton, and in some cases by a ton.

The light cars, to the number of about twenty, filled with pressmen, officials, etc., followed, while the Judges in the handsome 16 h.p. Daimler followed last. Two motor-lorries—the one

greatly of some of our receptions on the 1,000-mile Trial. The next stopping place was Warrington, where the local Mayor warmly welcomed us, and in that town a halt was made for luncheon. A long stay was made, our start being delayed by a puncture in the near side rear wheel, the offender being a long French nail. A few miles from Manchester another halt was made by the light cars to see the heavy vehicles pass, and all were delighted to see the smoothness with which all were travelling. At the Town Hall, Manchester, the Lord Mayor and Sir W. Bailey received the party, and the former conducted us to his parlour, where refreshments were served. The cars were afterwards taken to Belle Vue, and in the evening Sir W. Bailey presided at the dinner held at the Queen's Hotel. The subjoined table gives the performance of the vehicles on the run from Liverpool to Manchester.

The vehicles, when they arrived in Albert Square, Manchester, on Wednesday morning, from their housing quarters in Belle Vue Gardens, assembled under climatic auguries which were far from encouraging. Happily, however, the clouds soon dispelled, introducing conditions exceedingly favourable for motoring. Nature's own watering-cart had so effectually laid the dust, which is the great foe of summer roadway touring in any form, that, at all events, the first half of the journey was performed with great comfort for the judges, officials, and others who accompanied the competing vehicles. The return route to Liverpool, which varied from that of the previous day, lay through Moses Gate, Bolton, Atherton, Leigh, Pennington, Newton, Haydock, St. Helens, and Prescott. The route is one which necessitates the negotiating of considerable gradients, up or down, as the case may be, but in no case did they present the same difficulties as the one-in-nine steepness of Everton Brow, on which hill-climbing was specially tested on Monday. In returning, as in going, each competing vehicle bore a tonnage of merchandise, according to its class, for delivery at the end of the journey, as follows :—

- A1 1½ tons Pulleys from the Unbreakable Pulley Company, of West Gorton.
- A2 1½ tons from William Graham and Co., of Manchester.
- B1 4 tons from Tootal, Broadhurst, Lee, and Co., Limited, of Manchester.
- C1 6 tons of bale goods from Tootal, Broadhurst, Lee, and Co., Limited.
- D1 3½ tons Red Maid Soap for the United Alkali Company.
- D2 4½ tons Bale goods from William Graham and Co.
- D3 4½ tons Machinery from Crossleys, Openshaw, for J. G. Neville and Co., Liverpool.
- D4 4 to 4½ tons Machinery from Crossleys for J. G. Neville and Co.

Between Manchester and Prescott the district may be said to be occupied almost continuously by a teeming population, the evidences of whose labours in mining, cotton-spinning, and many other extensive industries deprive the face of the country of much of its natural scenic attractiveness. To the inhabitants along the line of route the passage of the automobile procession was a most interesting sight. What with householders, operatives, school children, and others there were miles at a stretch where both sides of the roadway were occupied by cheering crowds. The first stoppage took place at Bolton, in front of its classic-looking Town Hall, where the party was received by the Mayor, and luncheon was partaken of in the Swan Hotel. Afterwards the journey was resumed, and St. Helens safely reached, Major Pilkington, the popular Mayor of the town, entertaining the visitors, refreshments being served. After a short stoppage a restart was made, and Liverpool reached without any incident, except for one or two soft places in the roads, causing the wheels of some of the heavier vehicles to sink.

On Thursday the vehicles journeyed to Blackburn, via Wigan and Chorley, and on Friday the return journey was made from Blackburn to Liverpool, via Preston, Rufford, and Ormskirk. A report of Thursday's and Friday's proceedings will be published in our next issue.

"C. N. W." in his notes in the *Traveller* remarks that "at Etampes, a little while ago, I met an enthusiastic young French amateur *chauffeur* who was driving a De Dion voiturette. He assured me that, running short of petrol in a village where the stock was all exhausted, he had replenished his tank with absinthe from the nearest *café*, and that the motor had worked excellently!"

THE Committee of the Automobile Club have announced that, with the assistance of the Scottish Automobile Club, official trials of motor-vehicles will be held in connection with the Glasgow Exhibition, from Monday, 2nd September, to Friday, the 6th September next. The trials will consist of a daily run of 90 to 110 miles. Each motor-vehicle will carry an observer, and marks will be deducted from a possible maximum for every stop. The competition will also include some hill-climbing trials. A representative of the Automobile Club of Great Britain and Ireland will proceed to Glasgow to make further arrangements in the middle of the present month.

FLOTSAM AND JETSAM.

BY "FLANEUR."

AMONG ourselves we automobilists have discussed the racing between Paris and Bordeaux from the standpoint of mechanical efficiency. But there are others. Our dear friends the reactionary County Councillors, what have they to say? They have committed themselves to the opinion that the existing legal limit of twelve miles an hour is too high, and that the law should be amended accordingly, with a view to imposing a maximum of ten. Now (as these gentlemen are able to discriminate between degrees of danger with such mathematical certitude, and possess vast stores of knowledge on the subject of automobilism such as no *chauffeur* himself can affect to claim, it is natural that one should seek for guidance at their hands with regard to the performance of M. Fournier on his redoubtable Mors. Unfortunately—or perhaps fortunately—I have not the honour of the acquaintance of a County Councillor of the reactionary type, though I know many of more enlightened views. In the circumstances, therefore, I must perforce resort to an "imaginary conversation" in order to give the County Councillor a show, though I must confess to a lurking suspicion at the outset that the language even of a Landor will prove insufficient ere the close to do justice to the C.C.'s feelings.

Approaching the subject, and the County Councillor, with becoming reverence, I venture to inquire of him if he will favour me with his views on the question of the speed of motor-cars in general and the Paris-Bordeaux race in particular.

"Paris-Bordeaux race, did you say? What was that?"

"Oh (after with difficulty suppressing my surprise), it was a motor-car race run last week in France, and reported in all the papers."

"My dear sir, I rarely read the newspapers, and if I saw anything about motor-cars I should turn immediately to something else. It is necessary that I should keep an open mind on the subject, and so avoid prejudicing the issues. For the same reason I have declined the invitations of the Automobile Club to attend a demonstration either in London or my own county. It would never do for me to allow myself to be converted by automobilists' arguments; I *must* keep an open mind."

[NOTE by the Interviewer.—The Essex County Councillors excused themselves from attending a local demonstration, arranged by the Automobile Club, on the ground that they "wished to preserve an open mind!"]

"I should be glad of your opinion, nevertheless, as to this race, as it was a most interesting affair. The winning car attained a speed of——"

"Ah, now, there is that speed question. I do feel strongly about that. These motor-cars actually go faster than horses. Is it not terrible? I cannot understand why so much liberty was ever allowed to automobilists by Parliament. But we mean to put a stop to it soon. The maximum must be reduced to ten miles an hour."

"Then you consider twelve miles an hour dangerous."

"Certainly."

"And that it is possible to differentiate between the degrees of risk represented by ten and twelve miles respectively?"

"Quite so. Two miles an hour is a considerable difference in speed."

"Then if twelve is dangerous, fourteen is——"

"Exceedingly dangerous, of course."

"And sixteen——"

"Full of terrible risks to everybody concerned. I cannot imagine how a man can drive a car at such a frightful pace without disaster. I certainly never drove my horse so fast."

"Have you ever been on a motor-car?"

"Never, and never shall! Did I not say that I wished to preserve an open mind?"

"But surely, sir, circumstances alter cases. Out on the open road, for example, what possible objection can there be to a speed of even twenty miles an hour?"

"Twenty miles! You appal me. Such a speed is almost inconceivable. Why, even when my horse is on the gallop he doesn't do more than sixteen."

"Sixteen! But I understood you to say that ten was the utmost that was safe!"

"For a motor-car. A horse, of course, is different."

"But the motor-car has two or more brakes, as required by law, and can be pulled up in a few feet."

"Oh, I don't trouble myself about such details. All I know is that horses have been in use for thousands of years, and you surely wouldn't say that a motor-car is better than the friend of man?"

"But to revert to this race in France. The first car attained a speed of —"

"Ah, yes, that race. I suppose, now, they had a trial of speed over a measured mile, or something of that sort, and ran awful risks to pedestrians and themselves by driving at about eighteen miles an hour. Shocking!"

"The race was from Paris to Bordeaux, a distance of three hundred and forty-seven miles."

"Three hundred and forty-seven miles?" Incredible! I suppose they took several days to do the distance, and that only two or three cars competed?"

"Over sixty cars started."

"It is too terrible. I wonder the French Government allowed it. Numbers of pedestrians were killed, I suppose?"

"Not a solitary one."

"And the competitors?"

"No driver of a car was hurt, and the only accident was to a motor-cyclist, who foolishly tried to light a cigarette when going at top speed."

"But the other competitors, I take it, were very careful, and went very quietly?"

"Oh, certainly. Even the fastest man did not have a single mishap from start to finish."

"Just as I thought. And his speed would be about —"

"He averaged fifty-three miles an hour."

"What?"

"Fifty-three miles an hour throughout."

"! ! ! ! !"

"Probably, however, he touched seventy-five at times."

"! ! ! ! !"

"The winner beat the Sud Express, the fastest train in France, by nearly an hour."

At this juncture the conversation abruptly closed. The County Councillor's gasps and gurgles culminated in the display of all the symptoms of a mind unhinged by a terrific shock, and he is borne to an asylum, babbling of "Fifty-three miles an hour! And nobody hurt!"

IN all seriousness, however, I do hope that the lessons of this marvellous race will be laid to heart by those hostile to the automobile movement. So far from desiring that any similar event should take place in England, it may be said at once that no one would advocate it for a moment. But the mere fact that a motor-car has been driven at this tremendous pace over an enormous distance without any catastrophe whatever, and that many other cars also went through at high speeds with equally harmless results, should surely make the "ten miles an hour" fanatic pause in his senseless campaign. The mental attitude of the Parliamentary Committee which heckled George Stephenson many decades ago was far more reasonable than that of the reactionary County Councillor of to-day, with all the advantages of accumulated experience in the use of mechanically-propelled vehicles and the growth of mechanical knowledge generally. Yet the "ten an hour" man not only denies himself the benefits of an improved means of locomotion, but would gladly drag everyone else to the level of his own abysmal ignorance.

THERE must be something very rotten in our administrative system when it is possible for magistrates to display such childish intelligence as did the Chertsey Bench last week, when they convicted Mr. Lucien Le Gros for driving a motor-tricycle and trailer

at more than six miles an hour. No suggestion of furious driving was made: the evidence of the policeman himself was to the effect that the tricycle was proceeding at a speed of "from ten to twelve miles an hour," and, allowing for the usual inefficiency of police estimates, we may set down the actual pace at eight. The magistrates simply took advantage of the ambiguous wording of the Light Locomotives Act, and imposed a fine of not less than forty shillings, for an offence that was no offence, and was clearly never contemplated by the framers of the Act, who had in view, as the context clearly shows, the drawing of goods in a secondary vehicle of appreciable size. There is not the shade of a shadow of a reason why a passenger should not travel in a basket trailer, or on a Whippet single wheel, behind a motor-tricycle at the same speed as though he sat in a chair seat in front of the machine instead. Such, indeed, was the view adopted by the Weston Bench in January of this year; but Surrey is simply overridden with the type of "great unpaid" which is opposed to improvement in every form.

"WHO was she?" This is the question a great many persons were asking in Birdcage Walk on Tuesday morning. The object of their interested attention was a young lady, strikingly handsome, and dressed after the *dernier cri* from Paris, who was calmly driving a 12 h.p. Panhard, enamelled in red, picked out with gold. The car was fitted with a hood, and most elegantly finished, while behind sat an attendant in the smartest of liveries yet seen, where *mecaniciens* are concerned. A dainty parasol and a pet dog reposed on the seat beside the fair driver, who piloted her car with the most consummate ease and an entire absence of nervous apprehension. So attractive was the turn-out that equestrians even wheeled their horses round and galloped after the disappearing car, in order to gaze anew on the lovely figure at the helm.

BRIGHTON may eventually be cured of its "motorphobia": at all events, it is paying through the nose by reason of the abstention of automobilists from visiting that particular resort. Last year's commemorative run on November 10th must have transferred hundreds of pounds from Brighton hotel-keepers to the pockets of their Southsea rivals. More recently we have seen retribution take another guise. The police had to send a cheque to Mr. Firth in payment of the costs incurred in the vexatious prosecution of Mr. Edge, and now the Brighton Board of Guardians have been cast in £250 damages, as the result of an accident to Mr. Williams, whose car was overturned by the careless driver of a workhouse van. Possibly, in due course, Brighton will learn to treat the automobilist with respect.

A LETTER which I have just seen from M. Charron states that he has tested the new 10 h.p. light Panhard, and found it to be faster than the 16 h.p. heavy car of the same make. He is supplying the former at 13,000 francs, or £520. This sounds an advantageous way of obtaining a powerful car at a medium price, for, needless to say, cars at 16 h.p. do not sell at anything like that figure. Talking of light Panhards, by the way, it would be interesting to know the horse-power of the one driven by M. Giraud in the Paris-Bordeaux race, in the extraordinary time of 8hr. 9min. 48½sec., or sixty-four kilometres an hour. It is whispered that the car was equipped with a motor of 20 h.p. After the finish, the car was objected to as over-weight, but the official scaling showed that it just came within the 650 kilogrammes limit.

IT does not do to treat a starting-handle with disrespect. Mr. W. Hatfield-Green injured his wrist severely the other day when "winding up" his new 6 h.p. Panhard, but contrived to drive to Kempton Park and back with his arm in a sling, though, when a change of speed was necessary, the manipulation of the side lever involved no small discomfort. Another automobilist of my acquaintance tells me that he once sprained his wrist so severely by a careless start that he fainted twice in half an hour with the excruciating pain; and he is not by any means the sort of man whose looks would lead one to regard him as a fainting subject.

The Paris-Bordeaux and Gordon-Bennett Cup Race.

By "AUTOMAN."

THE Paris-Bordeaux race last week, which I was just able to report in time for the *Journal* of June 1st, marks a distinct epoch in automobilism, and leaves its lessons both for the manufacturers, purchasers, and also for the public. Before

The results of the race have been a complete and irrefutable answer to all these forebodings of ill, and have established the Paris-Bordeaux as a classic event which promises very quickly to rival in importance the greatest horse races and become a

LEON LEFEBVRE ON A BOLIDE CAR AT CHARTRES.

the race, I heard it said on all sides that this would be the last great race, and many journals predicted the terrible accidents quite unavoidable in the presence of the 20, 50, and 70 h.p. leviathans which would be disputing for the honours of the road. Some of

THE TURGAN-FOY CAR AT CHARTRES—REPAIRING A PUNCTURE.

general holiday along the line of route. Of third party accidents there was only the shock of fright of an inexperienced cyclist, who wobbled out of the way of a racing car and fell over in the gutter. Of accidents to competitors, one or two insisted in

GRUS ON A RENAULT CAR NEARING THE OUTER CONTROL AT CHARTRES.

the daily papers were indignant, and took up the cudgels for the poor peasants and villagers along the route who would desert their homes in terror. The least of all the terrors was the dust, which would render the roads impassable.

LEYS ON A PANHARD CAR LEAVING CHARTRES.

charging level crossings when the gates were closed, and got off with a few bruises and a broken wheel, a stone smashed the goggles of a third and the glass entered his eye, which after it had been extracted did not deter the intrepid *chauffeur* from

continuing. The only animals reported to have been killed were two unfortunate birds who wrongly estimated Fournier's speed and got caught in his radiator, and carried thus triumphantly to Bordeaux. Along the line of route it is true that everybody turned out, but it was in order to see the race and cheer the popular drivers as they flew by. As for the dust, there was no lack of it, but a few moments sufficed for it to subside. Road racing is certainly no more dangerous than any other form of sport, and, carried out under proper rules and supervision, will, in my opinion, be permanently established even in our conservative island, and will be a great boon to the sporting world and an encouragement and assistance to the manufacturers of automobiles and of all appliances connected with them.

Of the lessons of the races the most notable is the necessity of lightness. High power is of no use without great regard is paid to lessening of weight. This is where Napier went wrong, for one would have supposed that with 70 h.p. he would have been able to beat anything for a stretch at any rate, as a spurt, but the 33 cwt. odd, which I am informed the car weighs, told against Edge, even on the level, and though he was running well at various points of the route, where he was seen, I never heard of him passing any of the fast cars. Looking over the reports from the various controls one sees him falling gradually behind. Fourth at the start, fifth at Chartres, seventh at Tours, eleventh

GIRAUD AND ANDRE AXT.

at Couhé Vêrac, where he disappears from the records. Another proof of what I advance is the performance of Giraud on a light 12 h.p. Panhard and Levassor, arriving fifth and beating half a dozen cars of nearly twice the horse power. Girardot's splendid run will be hard to beat, and ought to convince the public that pneumatic tires made in a proper manner can be relied on. Amongst the *voitures légères* two racing Darracqs did well, coming in second and third, but perhaps the most remarkable circumstance of all the race was the fact that in the class for voiturettes the four Renault cars came in, in a bunch, all inside of 21 min., doing the 327 miles at an average speed of about thirty-five miles per hour, starting together and arriving together. The fact that two Werner motor-bicycles completed the distance in about 12½ hrs. has also been much commented upon. The following are the results of the two races:—

THE great demonstration of motor-vehicles in London before delegates of County Councils commenced in London on Thursday in favourable weather. Close upon eighty cars have been placed at the disposal of the Automobile Club to convey the visitors to Richmond. We shall publish a report of the demonstration in our next issue.

WE understand that owing to every event being a handicap it will be quite impossible to accept any entries for the Tilburstow Hill climb at Godstone, on the 15th inst., after to-day (Saturday). Entry forms can be obtained from G. H. Smith, the reporting hon. Sec. of the English Motor Club, 40, Holborn Viaduct, E.C. Amongst the entries received up to time of going to press is a 70 h.p. Napier.

THE Motor-Car Exhibition at the Agricultural Hall.

(Concluded from page 253.)

THIS week we bring to a conclusion our report of the exhibits at the recent Motor-Car Exhibition. We have been at great pains to make the report as complete as possible, and, where obtainable, illustrations have been given, so that the current issue, together with its four immediate predecessors, forms a most valuable record of the many interesting novelties that have lately seen the light in the English automobile world.

Mr. T. Crowden, of the Motor Works, Leamington, exhibited several of his special appliances for use in connection with automobiles and machinery of a similar character. Amongst these we noticed a balanced speed reducer, particularly designed for use with an electric motor, in which three rollers are used for transmitting the power to an outer rim, which forms a pulley for a belt drive. The object of this device is to avoid frictional losses by entirely dispensing with gear wheels. Mr. Crowden also showed an apparatus for setting the valves and valve gear upon steam-engines. This is a kind of indicator which is designed to save a considerable amount of time in work of this nature. A tubular frame for a light steam car was also shown, and, although incomplete for the Exhibition, was interesting. This vehicle, when finished, is to burn kerosene instead of petrol, and it is fitted with arrangements for condensing the steam. Amongst other features of this exhibit were a steering joint, a special wheel of the artillery type, and one of Mr. Crowden's cooling radiators, all of which have been described in the *Journal*. Those who have suffered from pump troubles would do well to enquire into Mr. Crowden's new rotary pump. This is chain driven and is fitted with adjuster.

Mr. J. Ravel, 19, Avenue de l'Opera, Paris, exhibited a sectional drawing of his "Intensive" petroleum-spirit motor. As this comprises several novel features, we hope to refer to it at length in a later issue. In the meantime we may mention that it comprises two cylinders, the pistons of which are connected to the same crank. By the special arrangement it is claimed that for a similar volume and weight the Ravel engine will develop half as much power again as ordinary petrol engines.

If there was one stand in the Minor Hall which attracted more attention than any other it was that of Messrs. O. Ström and Fils, of 16, Rue de la Chaussée d'Antin, Paris. Here those motorists who have not as yet crossed the Channel had an opportunity of examining the curious garments which French *chauffeurs* make use of. Fur coats and cloaks for both ladies and gentlemen were in evidence, as well as leather suits in brown and black. Considerable interest was shown in "La Couverture Pantalon," a combination article which can either be used as a rug or as a motoring suit in bad weather. Messrs. Ström have made a special feature of clothing for motorists and have a big connection in France.

Quite a new car to England was the Crouan, exhibited by the Société des Automobiles Crouan, of 57, Avenue de la Grande Armée, Paris. Two cars were shown, a 16-h.p. vehicle seating six persons, and a light car fitted with a 6-h.p. motor. The larger car was fitted with a special pneumatic change-speed gear, in which the clutches holding either of four tooth wheels to their shafts are operated by admitting compressed gases to air-tight and expansible chambers inside the moving clutches. A model showing the action of this mechanism was also on view. The Crouan motor is also on novel lines, comprising four cylinders in the large car, and two cylinders in the small vehicle.

The cylinders are set opposite to one another with a central crank shaft. In an early issue we intend to refer at length to the Crouan cars; in the meantime it may be stated that the motor is fitted with an automatic regulating device. Electric ignition is adopted, a special plug being used, which it is claimed never gives trouble by reason of carbon deposits or fracture of the porcelain. The motor is controlled by one handle only.

The "Umpire" storage batteries for carriage lighting were shown by Messrs. Sutherland and Marcuson, 61, Chandos Street, W.C. Owing to the compactness of this battery it can be placed inside the driver's box or under the seat, thus rendering it well adapted for lighting vehicles. The accumulator is of a solid character, and there being no liquid space the "washing" of the electrolyte is prevented. Hence the risk of removal of the active material from the plates is obviated. A 4-cell battery with a capacity of 30 amperes is the size recommended, this being sufficient for lighting three lamps for a reasonable time. In connection with this the "Umpire" charging board is employed. This instrument enables any form of battery to be charged from direct-current electric mains at any desired rate of charge. It also acts as a resistance, and in addition to indicating the direction in which the current is flowing it gives an approximate indication of the amount of current passing. A new form of variable resistance has been introduced by the firm which can be placed in circuit with any lamps and secures perfect regulation. The "Umpire" portable testing battery was also shown. This has been previously referred to in these columns, and it need only be said that it can be readily charged from any continuous current electric light circuit, and that it will retain its charge for a reasonable time.

Accidents will happen, even on board the best regulated motor-cars, a contingency which that most enterprising of insurance companies, the Law Accident Insurance Society, whose head office is to be found at 215, Strand, W.C., has been quick to provide against. At the Society's stand in the Gallery a brisk business went on daily on the principle of small premiums and big risks. Five shillings a year provides for £500 in the unfortunate event of a fatal accident whilst riding in a motor-car, and ten shillings covers £1,000. Another policy with an annual premium of £5 provides against liability for injury or damage done to persons or property not in the service of the insured to the extent of £100, also £25 compensation for accidental damage to the motor-car insured. Sixteen shillings per cent. on the value of a car insures it to its full value against fire or explosion.

Madame L. Longuemare, 12, Rue du Buisson-Saint-Louis, Paris, had a display of the "Longuemare" carburettors, which are too well known in this country to need a lengthy description at this time. The carburettors are made in various sizes, suitable for the motors of tricycles or the largest cars. A new carburettor is one arranged to mix the necessary carburetted air in vehicles in which alcohol is employed in place of petrol. Examples were also to be seen of petrol and alcohol burners for use in connection with tube-ignited motors.

Dry batteries for ignition on motor-cars, motor-cycles, etc., were shown by the Meyra Electric Company, Limited, 78, York Road, King's Cross, N. The Meyra batteries are of English manufacture, and were supplied to the King's Daimler car. It is claimed that they are reliable in all climates, and among the special merits are long life, high amperage, low in-

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

ternal resistance, absence of local action, and generally high efficiency. Set on a motor-cycle the Meyra battery has a life of about 400 working hours, giving a long spark. These sets of batteries will give a constant spark for ignition purposes for several months, and, at the same time, supply enough current to light a 5-volt portable reflector lamp, used to examine the machinery of the motor-car when necessary at night.

FIG. 1.

The novelty at the stand of Messrs. Trier Brothers, 1, Great George Street, S.W., was a patent automatic check-valve lubricator, of which we give an illustration (Fig. 1). In this the reservoir contains a piston actuated by means of a spiral spring. The threaded rod is screwed through the piston and projects below so that the exit is closed in the shank like a valve; thus a source of waste in some lubricators is entirely prevented. In filling the lubricator the spring ring catch, by which the reservoir is locked, is released, and by turning the piston rod the piston is screwed back. This should be carried on as far as possible. When the reservoir is replaced the exit is closed by the piston rod end. In order to cause the lubricator to work effectually, the piston rod has to be screwed back according to the amount of grease required.

Then the piston and piston rod move forward together, the feed continuing until the rod again closes the exit. This lubricator has been specially designed for use on motor-cars, and will be found not to be rendered inoperative by vibration and dust—a feature of great importance to motorists. In addition to this new speciality, the firm showed the well-known "Stauffer's lubricant" and the "Centi-grade" Stauffer lubricant for motor-car bearings, gear and chains. There were also on view spring pressure lubricators, the "split-grip" collars for shafting, and grindstone dressers and emery wheel truers—a very complete and useful collection.

Very interesting was the stand occupied by Mr. H. W. Van Raden, 7, Ellys Road, Coventry. A central feature was his patent Woven-glass accumulator for automobile ignition. In this the active material is firmly held by the woven fabric, and cannot, no matter what the vibration, become detached from the electrode to cause short circuit or self discharge. Each electrode is wrapped in a sheet of spun glass, through which the electrolyte has free circulation. All plates are packed firmly together, making the whole a solid yet flexible mass, free to expand during the charging, and in which the plates of opposite mark cannot get into touch with each other. These accumulators are made in various sizes for motor cycles, voituresses, and cars. They are said to give three months' service on one charge, and from the nature of their construction can be expected to withstand vibration. Electric motor controllers, accumulator-charging dynamos and switch boards, volt meters, ampere meters, pocket watch volt meters, sparking plugs, induction coils, and all the electrical appliances necessary for motor ignition were shown by Mr. Van Raden.

An automatic machine for building cycle, motor-car, and carriage wheels, exhibited by the Wheel Machine Company, of 23, College Hill, Cannon Street, London, E.C., should revolutionise the hand process of obtaining that exact amount of tension which must exist between hub and rim in a true running wheel. The wheel, roughly put together, is finished off on the machine. Each spoke is pushed into a slotted pinion, the lever is thrown into gear, and when the nipple has been screwed the required distance, the machine is automatically thrown out of gear, and the slotted pinion carried round to receive the next spoke.

There was nothing exciting about the exhibit of Messrs. J. F. Pease and Company, Limited, of the Skerne Works, Darlington, whose display was characterised by utility rather than by brilliance. It comprised steel barrels and receptacles for the storage and carriage of petrol with safety, ease, and economy—a threefold object which is fully attained. For use with the barrels an atmospheric pump is provided, and the adoption of this secures the motorist against the troubles of stale oil. A capital syphon for use with lubricating oil was also shown. This fits, as does the pump, into a collar at the top of the receptacle, and the ordinary action ensures all the oil being drawn off in a steady and continuous flow. The barrels are jointed in the middle, thus obviating any likelihood of leakage at the top or bottom, while the handles provided in the top are so fixed in an indented centre that they can be packed one on the other in a minimum of space. These features attracted practical motorists to the gallery, where their usefulness was demonstrated daily.

Bowden's Patents Syndicate, Ltd., of 151, Farringdon Road, E.C., had an exhibit of the uses to which the Bowden wire mechanism can be put in connection with motor-cycles and cars. For the sake of those unacquainted with it we may mention that the mechanism consists of a flexible tube composed of spirally wound wire, the coils of the tube being close together and touching one another, so that it cannot be compressed. Inside this is carried a fine stranded steel wire. The spiral wire being closely coiled is incompressible longitudinally, and the stranded wire which is carried inside the spiral is inextensible. If the ends of the spiral wire are held or fixed by means of a stop, and the stranded wire is then pulled, it will be found that—although the spiral wire is bent round angles or even tied in a knot—the inner stranded wire can be easily pulled through it. In short, the patent wire mechanism forms a means of transmitting power round angles where hitherto it has been necessary to employ joints or angle levers of various kinds. In addition to a table on which were shown variable applications, such as the lifting of a 56lb. weight, and the operation of a rudder from the bow of a boat, the Bowden Company exhibited a motor-quad in which the ignition, carburettor, exhaust valve lifter, band brake, and Mercier two-speed gear were all controlled and operated by Bowden wire mechanism. One simple adaptation of the stranded wire in the coiled and flexible conduit gives a double action most useful in the application of band brakes, as it holds the band in position on the drum, both for forward and backward travelling. A novelty is the application of the mechanism to the regulation of the carburettor. The levers are drawn in one direction by the "Bowden" wire, and in the others by springs. Sufficient resistance is introduced into the apparatus to allow it to remain where set. In Fig. 2 we show the device fitted to a cross lever so arranged as to lift the exhaust valve of the motor at the will of the rider. The upright arm on the right has a long slot *a* which fits over one of the bolts of the De Dion engine case and is fastened securely by the nut. The cross bar *c* is pivotted at the end of this upright arm and extends across the side of the motor, coming in contact with the exhaust-valve stem which passes through it. Its outer end is kept normally down by means of a tension spring attached to a clip as shown, fastened on one of the crank case bolts. The end of the lever *c* is pulled up by the flexible Bowden wire *d*, the end of the wire casing being firmly attached to the lug *h*, which is attached by means of a flat plate to the head of one of the cylinder holding-down bolts *g*. The whole of the mechanism is extremely simple and forms a convenient method of operating

FIG. 2.

an exhaust valve lifter for starting motor-tricycles and quadricycles.

The Radax tire was shown by the Radax Pneumatic Tire Company, Limited, 51, Fountain Street, Manchester, and 32, Bread Street, London, E.C. This tire possesses a patent canvas, so woven that the sides of the outer cover fit closely in the rim, and form a sound principle of attachment. Being woven in a circle it is possible to secure the threads being small at the edges or smallest circumference of the tire, and to gradually increase in size as the circumference becomes larger. Thus the tire is

FIG. 3.

made to perfectly fit the rim and so obviate any possibility of rolling friction. Whilst in use it cannot be forced from the rim—even if it is punctured or but slightly inflated. Despite its tenacity when in actual service, there is no difficulty in taking the tire off or putting it on, while the fact that it is made to fit all kinds of rims now in use should lead to its adoption by many who have not yet found a tire to their liking. The company's stand was occupied with a selection of motor tires of various weights and sizes for vehicles up to 10 cwt., fitted on rims of different makes.

Mr. Henry Waterson, of Albert Road, Aston, Birmingham, is a man of parts, good parts too, if those applicable to motor-cars which he exhibited at Stand 25 in the hall may be taken as specimens. Radiators, accumulators, pumps, springs, switches, E.I.C. mica sparking plugs (Fig. 3), insulating wires, and a host of other things all stamped with that well-known brand of good faith which is "E.H." catered for the requirements of the motorist, no matter the type of car driven or the motive power employed. To the votaries of petrol a reservoir, made in any size, and fitted with a pump, was interesting, because it can be carried on the motor-car and replenish the exhausted tank without stop or other delay. Another important feature of this very complete exhibit was the "Progress" motor-car frame, in which the radiator of the "serpentine" order is hidden away beneath the body of the car. Besides providing the various component parts of the motor-vehicle, Mr. Waterson also caters

FIGS. 4 & 5.

for the comfort of the motorist in other respects. His "E.H." motor-valise, trunks, and visiting cases of solid leather, with steel frames, can hold a lot, yet are not too bulky to accompany the tourist on board the car. Another interesting exhibit was that of the Douglas carriage clocks (Fig. 4 and 5) the sole agency for which in this country has been secured by Mr. Waterson.

Wheels of every type and grade, of ash, acacia, hickory, oak, iron and steel, for the daintiest motor-car or heaviest traction engine, made by Messrs. Fr. Hering, of Gera, Germany, were to be seen amongst the many exhibits of Messrs. Philipp and Company, of Dashwood House, New Broad Street, London, E.C. Bearings to facilitate the running of these wheels, notably of

the ball type, are made of metal hardened by a special process. Under-carriages for motor-cars were also prominent. One in particular, with a four speed transmission gear and reverse motion controlled by one lever, attracted attention. Differential axles for motor-cars and voiturettes, steering gears, forged arms, hubs—in fact, everything calculated to combine ease, simplicity, and speed, with a minimum of weight and maximum of strength in construction, was to be seen at Messrs. Philipp's stand.

Among the several good exhibits in the Gallery was a fine collection of air cushions for motor-vehicles made by Messrs. Warburton, Allen and Company, Yeoman Buildings, Rutland Street, Leicester. These cushions (Fig. 6) are made of special pure rubber compound, which, being vulcanised, secures durability and strength, while being absolutely odourless. The main feature of the cushions is the manner in which the walls are "tied," that is, exactly as are those stuffed with hair, etc. The result is a delightfully buoyant seat, which is at the same time firm, and on any part of which one can sit without the remainder of the cushion expanding beyond its normal size. Thus a depression at one end does not secure a corresponding rise at the other—a feature which is prominent in many similar air cushions on the market. By the adoption of these cushions vibration is lessened, and they have the further advantage of being always dry and clean in appearance. They are covered in various materials, thus enabling the owner of a motor-car

FIG. 6.

to obtain cushions of the same colour and appearance as the upholstery already in use on his vehicle. Cushions on the same principle, and by the same makers, are already in use on yachts and steamers, so that the idea is not an untried one.

A large stand in the Arcade was occupied by Messrs. Fleming, Birkby and Goodall, Limited, of Halifax, and 39, Lime Street, E.C. Beltings, of which the "Teon" is one amongst many specialities, comprised the larger part of their display. A section of an oil-less bearing which had run 15,000 miles, and was apparently fit to start upon another long run, testified to the firm's solution of a much-vexed engineering problem.

All business is capable of expansion, a want of method being as often as not the sole cause of stagnation, or, worse still, contraction. To remedy this evil the Remington Wabash Company, Limited, of 100C, Victoria Street, London, E.C., have evolved the "Expansion Business System." The system, which was on view at the Agricultural Hall, took the form of furniture for office or study, and so comfortable and elegant was it that one was puzzled to know which was for one and which for t'other. Roll-top desks, office chairs, tables, letter filing and card index cabinets are amongst the devices by which time is saved and chaos reduced to order. The "Rem-Sho" typewriter, which could be seen at work, or worked for that matter, is one of the best on the market; an interchangeable carriage holds a 9 or 14 in. paper, and, what is more important still, the operator has his work under his eyes the whole time.

Kopaline is the distinctive name given to a new puncture-proof band which deserves more than a passing glance from all who have experienced the delays and annoyance of punctures—and who has not? It was shown by Messrs. Walter Lowen and Company, 36, Aldersgate Street, E.C., and consists of a woven band which encloses scales made of a specially-prepared hide, and kept in position by sections woven into the band. The

extremities of the scales are trimmed, so that when stretched out they form a perfect belt. Lightness and durability are characteristics of the band, which does not impair the elasticity of the tire. The band can be very easily adjusted, and is said to be unaffected by changes in temperature. It certainly secures good protection against nails, glass, and other enemies to pneumatic tires.

The Crawford Gear Company, Ltd., Brooks' Motor Works, Holbrook's Lane, Coventry, had on view a compact two-speed gear,

FIG. 7.

(Fig. 7) which is claimed to be particularly suitable for light or heavy oil cars, and for the transmission of any horse-power. The gear is noiseless, whilst it is claimed to have a dead central drive, to be perfectly balanced both in weight and driving strain, dust-proof, and self-oiling. The changes of speed are obtained by means of toggle action. Two speeds are available; when the friction cone is engaged the power is transmitted direct; when the cone is disengaged it is conveyed through a train of gear wheels always in mesh. The reverse motions are obtained by a gear in a separate case, but we learn that a new design is being introduced in which the forward and reverse motion mechanism will be combined in one casing.

Mr. Argent Archer, 195A, High Street, Kensington, W., had some excellent specimens of photography of motor-cars—a branch to which he is specially applying himself. Not only has he been very successful with outdoor work, but his photographs of interiors are distinctly good.

Costumes for ladies who indulge in motoring attracted many to the stand occupied by Mr. Charles R. Base, 309 and 310, High Holborn, W.C., whose enterprise in catering for automobilists is being recognised in an expanding business. Fur coats for ladies were a special feature of his display on this occasion. Neat liveries for the servants of automobilists were also on view. One of these was in black or brown leather, cut to fasten at the front with hooks, and faced with box-cloth of any colour desired. Breeches are generally worn with these, made of the same leather as the coat, and boots or gaiters. The cap can have a peak to match the facings of the jacket, and, nicely braided, makes a very effective livery. Double-breasted leather Chesterfields with Melton collars and wool lined were another exhibit worth consideration. A combined rug and foot sack was a novelty, the ordinary muff for the feet being lengthened so as to include the whole of the legs, and form a complete and perfect protection from the wind and weather.

Those who prefer leather clothing when motoring found much of interest at the stand occupied by Mr. Alfred Dunhill, 145 to 147, Euston Road, N.W. Prominent among other leading lines was a coat in very light dressed calf—much thinner than the leather hitherto employed, thus securing the minimum of weight with the maximum of flexibility and weather-resisting qualities. Storm cuffs, gauntlets, etc., were also shown, as well as leather hats, overalls, leggings, knee aprons, rugs, wraps, collapsible canvas buckets, etc. A good style of coat was seen on this stand, one with cuffs fitting tightly round the wrists, thus preventing those frequent draughts associated with much of the earlier clothing provided for motorists. A combined trousers and knee apron will be found very useful for drivers. Mr. Dunhill not only provides for the comfort of the motorists, but he is also concerned with the well-being of the

motors themselves, and in car covers he had some well-finished lines, neatly eyeletted and well designed. The "pure white" india rubber footboard mats, with slots cut in to allow for steering and brake rods, etc., were to be seen on this stand; the list of exhibits on which also included all kinds of hose, washing clogs, brushes, chamois cleaning tools, and a new lifting jack, which, although small in size, will deal with a ton weight.

Making a speciality of clothing for motorists, Messrs. Hoare and Sons, of High Holborn, naturally took occasion of the excellent opportunity which the Show presented of bringing their goods to the notice of likely customers. From a capital position in the Arcade they attracted attention to the "Marlborough" autocoat and autosuit, the "Windsor" motor-cape, the "Aquatecta" waterproof overcoat, and other excellent clothing for service against rough winds and uncertain weather. Not only are the materials employed well calculated to withstand the storm, but the designing of the garments has been well thought out, and in style and appearance Messrs. Hoare and Sons made a good show.

Very complete, so far as the motorist's personal equipment is concerned, was the stand in the Arcade whereon Messrs. A. W. Gamage, Limited, of Holborn, displayed some fashionable designs in motor clothing, including black and brown leather suits, overcoats, riding breeches, etc. Among the novelties was a tweed coat of the latest pattern with sanitary wool fittings and deer-skin lining. Attention was directed to Irish homespun coats of good design and well calculated to keep out wind and cold. Many pockets are provided in all the garments exhibited on the stand—a point of great importance to those who go on long tours. In addition to a very complete selection of clothing for automobilists, there was a capital display of motor caps, gloves, and leggings, while several specialities in gauntlets seemed to attract general attention. Gamage's are making a feature of motor caps, and these, with a collection of motor accessories, such as motor horns, lamps, etc., completed the display.

An unimpaired vision is an essential to the motorist, and a large crowd surrounded the sight-testing apparatus of the American Semetropiques Lens Company, of 55, Holywell Street, London, W.C. An easy process discovers the smallest, and often quite unexpected defect in one's eyesight, which the company is able to remedy with glasses "made to measure." A pair of blue glasses with a half mask of silk attached—exhibited by the same firm—would prove an indispensable blessing to many in a strong light or on a dusty road.

The presence of a mechanic fixing and demonstrating a quick method of altering sparking plugs and generally giving information on plugs to motorists gave added interest to the stand of Messrs. Frank F. Wellington, Limited, 36, St. George's Square, Regent's Park Road, N.W. The cars shown by Mr.

FIG. 9.

Wellington comprised an 8 h.p. Mors dog cart, a 6 h.p. M.M.C. wagonette, a Gladiator quad, and a Bayliss-Thomas motor-bicycle. Several motors were also on view, including a 3 h.p. Aster air-cooled motor and water-cooled engines of $3\frac{1}{4}$ h.p. and $6\frac{1}{2}$ h.p. respectively. Special attention was naturally directed to the Wellington sparking plug (Fig. 9), which has asbestos washers. No cement whatever is used in its construction, and it has the advantage of being easily repaired. Throughout the exhibit a battery and coil was set up on this stand in connection with a pressure gauge and a special apparatus, in which the spark was caused to jump between the platinum under air pressures ranging from 200 lbs. down to zero—an experiment which created undoubted interest.

Messrs. J. W. and T. Connolly, of 65, Wharfedale Road, King's Cross, N., had a good collection of wheels fitted with their "Ideal" rubber tires. These can be applied to all existing rims, and have been adopted by some of the leading motor-car firms with great success. The tires are held on the rim by means of two electrically-welded wires in such a way that it is claimed that the tires cannot come off the rims or creep. The tires are now being made in sizes up to 2½ in., suitable for cars of a total load, with passengers, of two tons. Samples of the tires were shown fitted to both wood and steel wire-spoked wheels. At this stand, too, were the Grant roller bearing axles, in which the necessary wear is distributed all over the surface.

"Buttercup" metal polish in tins, varying in price from a penny to a shilling, was the exhibit of the Chiswick Soap Company. It is applicable to all bright parts and produces a most pleasing and speedy effect.

The Motogear Company, 39, Cowper Street, City Road, London, E.C., make a speciality of the cutting of spur, bevel, and mitre wheels in raw hide, fibre, steel gun-metal, etc., for use on motor-cars, and the specimens they had on view of these at the Show attracted much attention on the part of trade visitors.

Price's Patent Candle Company, Limited, of Belmont Works, Battersea, London, S.W., has done so much to enlighten this dark world of ours that we naturally look to it for light on many a mooted point where motoring is concerned. At the company's stand, one of the first on the left on entering the Exhibition, light was to be obtained not only in the form of oil for lamps, lubricating and cleaning, but in two pamphlets entitled respectively, "Some Aspects of Lubrication" and "The Lubrication of Motor-Vehicles and Cycles," both by Mr. Veitch Wilson, a gentleman who writes with the authority of one who has spent years in the manufacture of lubricants, and who has also devoted much time and study to the chemical aspect of the questions with which he deals.

THERE will be an international motor-car race on the 14th of July from Moscow to St. Petersburg.

THE Alsace-Lorraine Automobile Club is organising a race from Strasburg to Colmar and back (a distance of 155 kilomètres) for the 16th inst.

REPLYING to a question in the Italian Chamber by M. Socci, the Minister of War said that all the automobiles for the Italian Army would be ordered in Italy.

THE German railways now accept motor-cars as luggage, on condition that they contain no petrol or other inflammable substances, and that they are the property of the person travelling with them.

THE Accumulatoren-Fabrik Gesellschaft, of Vienna, has secured a concession to establish and work a service of electrical omnibuses between Hirschwang and Payerbach; Lohner-Porsche hub motor-vehicles will be used, current being supplied by a battery of Tudor accumulators.

AN ordinance providing for a speed limit of nine miles an hour for motor-vehicles between 8 a.m. and 10 p.m. in the streets of Philadelphia has been introduced and referred to a sub-committee. In the meantime the police have received from the Superintendent the following instructions: "Automobiles, bicycles, and other vehicles propelled by steam or electricity must not be allowed to reach an immoderate rate of speed. This class of conveyance has no greater rights than any other vehicle."

AFTER more than a month's test of capacity and capability of an electric patrol vehicle under the hard usage such a conveyance is subjected to in police service, the Chief of Police, of Hartford, Conn., reports: "The vehicle is superior to the conveyance previously used in cleanliness and speed, and can be run more economically. The wagon does the work of four horses at a nominal expense of about 18 cents a day for power. I can safely say that the wagon is admirably adapted for the use to which it is put, and the department has occasion to feel proud that it is one of the first in America to be equipped with a vehicle that is modern and ornamental as well as useful."

CONTINENTAL NOTES.

BY AUTOMAN.

THE next great event is the Paris-Berlin race, which will be really more of an international struggle than the Paris-Bordeaux was. It will be a battle royal between Panhard, Mors, Mercedes and Serpollet, and, I hope, Napier. Panhard will have thirteen of his 50 h.p. cars in line and Mercedes has also produced a new type of 50 h.p. car. I saw the first one being driven along the Bordeaux road by its owner, Mr. Daunat, an American painter resident in Paris. M. Charley, the French agent of the Cannstatt Company, tells me that it weighs only 20cwts. 2qrs. 19lbs., and does the kilomètre in thirty to thirty-one seconds—equal to about seventy-four miles an hour.

SPEAKING of the Paris-Berlin race, I would remind the readers of the *Journal* that the A.C.F. propose to run a special train to take passengers along the route in such a manner that they shall see the arrival at each lap. The train will consist of sleeping and dining cars, and the fare to Berlin will be £8. Applications for places must be made not later than to-day, June 8th, and should be addressed to the Secretary of the A.C.F., Place de la Concorde, Paris. The train is open to all, whether members of the affiliated clubs or not, and ladies are also entitled to reserve places.

WAR has been declared by the A.C.B. against the Moto-Club of Belgium, an edict having gone forth that in future in all the contests and fêtes organised by the A.C.B., and in which members are alone allowed to compete or take part, such members will be disqualified if they should also belong to the Moto-Club.

THE Nice Automobile Club is organising a touring competition on original lines. The competitors are first handicapped according to the weight and horse power of their cars, and marks will be given in accordance with the distance covered, the altitude attained, the countries visited, the best account of the journey, and the best photographs taken en route. The competitors will have to send in the largest number of post cards they can during the course of their wanderings. The prizes will consist of a cup and two medals.

THE Touring Club of France has decided to hold a competition for brake power some time in August next. There will be three different trials—viz., (1) going slowly down an incline of from 5 to 6 per cent.; (2) going steadily down a hill of 10 per cent. for 3¼ miles; (3) stopping suddenly.

THE new regulations for motor-cars in Berlin come into force on June 15th. The following are the most important clauses: Every car must have two independent brakes, each capable of stopping the car in eight meters whilst going at a speed of 9.1-3 miles per hour. The lamps must be powerful enough to light up the road for twenty metres ahead. Any person under eighteen years of age is forbidden to drive a car. Every car must have a registered number given by the police, and also must have attached to it the name and address of the owner. There are no restrictions as to speed but a recommendation to reduce the pace to nine miles per hour at night, in crowded streets, and on bridges, etc., etc.

MR. J. N. TATA, a Parsee millionaire, is establishing a service of motor-cars from Poona to Mahabaleshwar, the hot weather seat of the Bombay Government.

WHILST taking a spin in a motor-car two gentlemen recently came to grief over a dog at St. Anne's. The animal defied their advance, and in order to avoid running it down the driver slightly changed his course and ran against the kerbstone. The car rolled over, knocking over a bassinette containing a baby, and the oil receiver caught fire. Fortunately, all concerned, even the dog, escaped without injury.

CORRESPONDENCE.

WET AND DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Foster's letter in last week's issue, re the merits of wet and dry cells for ignition purposes on a tricycle, I should recommend him to try Van Raden's Woven-glass accumulators, which have given satisfaction to all the people I know who use them. The great advantage of secondary cells over dry cells is the constant, or practically constant, voltage. Of course an accumulator on no account should be "shorted" with a wire across the terminals—as I have seen done—to see if they are charged, as permanent injury is done to the plates. These cells will run as long as any dry cell, and, instead of being thrown away, can be charged for about 1s., as against about £1 for a new set of dry cells. I see Mr. Foster mentions charging by the roadside; is he referring to primary cells? Of this type I believe the Doe is the best, but personally I know no one who uses these. The accumulators for a tricycle should be charged at a fairly low current for several hours; the lower the current and the longer the time gives the more efficiency. Meyra dry cells, I believe, are the best, if Mr. Foster intends to stick to dry cells. If there are any more points about the respective merits of cells, I shall be very pleased to give Mr. Foster any information on them.—Yours truly,

C. P. COBB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. W. T. Foster, I would strongly advise him to dispense with both. I have had a lengthy experience with dry and wet batteries, neither are practical for electrical ignition; I recommend him to use only an accumulator. If Mr. Foster will write to me I shall have pleasure in giving him any information upon the subject.—Yours truly,

J. B. MORRIS.

WINDING-UP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I find the "winding-up" necessary to start my 5 h.p. petrol car a considerable exertion and a nuisance; so much so, in fact, that I feel inclined to sell it at a sacrifice. Is any kind of motor-car made that can be started without having to be wound-up?—Yours truly,

WORK SHIRKER.

GREASE CUPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I remember seeing a lubricator at the Exhibition, marked "Patent Central Screw," which I think is what the P. and W. Company want. Referring to my catalogue, I find this lubricator illustrated on page 138. Messrs. Trier Brothers, of Great George Street, Westminster, were the exhibitors.—Yours truly,

W. HAMPSTEAD.

THE NAPIER RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 25th ult. you kindly mentioned that one of our friction clutches had been fitted to one of the Napier racing cars. It was to the car which ran in the Paris-Bordeaux race. A correspondent of one of the London daily newspapers has sent a so-called explanation of the withdrawal of the car from the race, stating that it was due to something being wrong with the "cones," the natural inference from such a statement being that the clutch failed. Under these circumstances we would esteem it a favour if you could kindly assist us in preventing the spread of such an impression, by permitting us to state that Mr. Napier has assured us he has no complaint whatever against the clutch, and, in confirmation of this, he has favoured us with an order for two exactly similar clutches for the other two cars.—Yours faithfully,

THE CHAMPION FRICTION CLUTCH COMPANY, LTD.

WATER FOR LOCOMOBILE STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It will probably interest the users of Locomobile cars to know I have demonstrated that the single-seated car can be run ninety miles with one supply of water by recovering the water of condensation and purifying it from oil, for repeated use in the boiler. During the Whitsuntide holidays I ran about 300 miles with the first car fitted with our improvements, and have pleasure in forwarding for your inspection a sample of the water remaining in the tank at the end of the journey, which you will observe is remarkably pure, free from grease, and in fact is most accurately described as distilled water. The efficient separation of oil from the water of condensation, which has proved a most difficult problem, is now done so thoroughly that it is possible for the cylinder lubricating oil to be recovered for use again, which has the double advantage of reducing the cost of expensive cylinder oil, and rendering one largely independent of fresh supplies when touring.

The car referred to above is the one that was exhibited at the Agricultural Hall, and is fired with kerosene. The consumption of kerosene in the above trial comes out one gallon per fourteen miles. I made the run from London to Littlehampton (sixty-two miles) without a stop for fuel or water, and the steadiness of the steaming and general running may be inferred from the fact that I was able to keep an appointment at Pulborough, Sussex, exactly to the minute, doing the run from Dorking, a distance of twenty-eight miles, in 1 h. 56 min.

It may be possible to run even longer distances than the above with one supply.—Yours faithfully,

THE CLARKSON AND CAPEL STEAM CAR
SYNDICATE, LIMITED.

(T. CLARKSON.)

MOTOR-BICYCLES AND TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am anxious to know if there is any kind of a guard made to fix on behind a motor-tricycle, to prevent the machine from tipping backwards, in case the sparking lever should happen to be advanced when starting the tricycle.

In answer to your correspondent's inquiry, motor-bicycles are, I think, liable to be taxed, as I know that motor-tricycles are liable, having had a reply to that effect from Somerset House, in answer to an inquiry which I made. I hope that the tax will be eventually repealed, so as to place all cycles on an equal footing of freedom from taxation.—Yours truly,

CECIL JACKSON.

MR. J. W. STOCKS, in company with F. T. Bidlake, proposes starting at 6 a.m. on the 9th inst., on an Ariel quadricycle, for a jaunt from Land's End to John o' Groat's.

MR. FRANK MORRIS, sole Norfolk agent for Daimler cars, has recently extended his works at King's Lynn. The new plant includes milling and drilling machines driven by a Robey gas engine, with which he is now constructing interchangeable parts for Daimler cars. Mr. Morris is also turning out some complete cars.

A NOTICEABLE feature of this year's Derby was the number of motor-cars which took the road for the historic Downs. Not only did their owners arrive at the course in good time, but they had a decided advantage in getting away, and mostly arrived early in town, well before the hurly-burly. No need for them to undergo that appalling delay usually associated with the process of finding and harnessing one's horses after the races.

MR. F. PARKER, of the Cycle and Motor works, High Street Slough, has been doing good service in the cause of motoring for the last two years. During that period he has conveyed hundreds of people, including local Magistrates, County Councillors, and policemen about the Thames Valley in motor-cars. He has recently moved to the above extensive premises, which are close to the post office, where he can store a dozen large cars, do repairs, and supply Pratt's motor spirit.

HERE AND THERE.

DR. BONSAILL, of Aberystwith, is one of the latest additions to the ranks of motoring doctors.

TWO motor-trolleys recently appeared at Hadley, and underwent a trial to the complete satisfaction of all concerned.

MR. E. O. HERBERT, of Upton-on-Severn, has been appointed agent for the Locomobile steam cars in that district.

THERE is some talk of starting a service of motor-cars between Darlington and Richmond, Yorks., a distance of 12 miles.

DURING the past month a weekly average of eighty-five automobilists have been fined for exceeding the legal rate of speed in the streets of Paris.

THE Lincolnshire Automobile Club held a run to Revesby on Saturday last, but only a few enthusiasts turned up. The proceedings were, however, very enjoyable.

USERS of motor-cars must expect some obstacles from obstinate people, but both the obstacles and the raisers thereof will gradually disappear.

DR. CAUDWELL, of Ropsley, near Grantham, has lately purchased a "Stonebow" car. He was such an apt pupil that he drove most of the way home from Lincoln, and then took the *mecanicien* down to Grantham Station and returned alone.

"MY AUTOMOBILE BOY" is the title of a new song brought out by the Chadwick Music Publishing Company, of Westfield, Mass. The air is catchy and the words appropriate.

THE Tyne Traction Company, Limited, has been registered, with a capital of £2,000, to carry on the business of hauliers, carriers by means of motor-cars, etc. The registered office is at Bank Chambers, Laygate Lane, South Shields.

THE new light carriage introduced by Messrs. Charron, Girardot and Voigt, of Paris, is extremely speedy, as well it may be, fitted with a Cannstatt-Daimler motor developing 22 h.p. The power is transmitted direct to the driving wheels.

THREE Blackpool men whilst riding in a motor-car had the misfortune to capsize it, with the result that two of them were conveyed to the hospital, where their injuries were found to be of such a nature as not to require their detention.

WHILST riding a motor-tricycle at Hyde, Mr. Joseph Wild, an ex-Mayor of the borough, who is over seventy years of age, lost control of the machine, which collided with the kerb and overturned, causing serious injury to the rider.

THE Reading and District Motor-car Company, Ltd., has been registered with a capital of £5,000 to carry on in Reading, or elsewhere, the business of builders of, and dealers in motor-cars, omnibuses, wagons, etc.

MR. OLIVER STANTON is the subject of an article in a recent number of the *Onlooker* as "The Man Who Drives the King." In the course of the interview Mr. Stanton is reported to have stated that the Daimler Motor Company are building a new body, specially designed to cope with the dust question.

A MOTOR-CAR accident occurred on the Chester to Manchester high road, near Tarvin, last week. A motor-car, which commenced a few days ago to run between Chester and Kelsall, left the former place, and was in the act of passing the Manchester coach, which was running in the same direction, when a collision occurred, and resulted in serious damage to the motor-car. The car was full of passengers at the time, but all escaped injury.

THE Roadway Autocar Company, Ltd., inform us that they can now deliver from stock 6 h.p. Mors cars fitted with new patent regulator, magneto-electric ignition, and wheel steering. The new regulator acts both on the valves and the governor, and greatly facilitates the handling of the car in traffic and for slowing down and quietening the engine when the car is standing. We understand that all the Mors 10 h.p. cars will be fitted with the new regulator and magneto-electric ignition in future.

A SOMEWHAT serious accident befell Mr. H. Brampton, of Kettering, on Whit Monday, whilst riding a motor-bicycle on the

Stamford road. One of the front forks becoming detached from the hub, the rider was thrown to the ground, and sustained a severe fracture of the left leg. First aid was promptly rendered by some men of the local ambulance, pending the arrival of a doctor.

SO fully is the economy of the motor-car appreciated in Philadelphia that the city employees wish to exchange the horses and vehicles which they now use for inspection purposes for automobiles. The city allows them 400 dollars per year for the keep of the horse and equipment, and this allowance the employees wish continued for taking care of the horseless vehicles. This, however, is meeting with some opposition from the authorities, who consider the sum excessive for the upkeep of a motor-car.

MR. H. A. O. MACKENZIE has presented to the Automobile Club a photograph of a steam-carriage which he built in 1874. This was the first self-propelled carriage which had the compensating gear upon the countershaft instead of on the axle. The carriage is believed to be unique in having had "mortice" wheels (wood teeth) for the driven wheels on the countershaft; these "mortice" wheels were substituted for the original cast-steel wheels in 1876, and were perfectly successful and silent in working.

SEVERAL daily papers lately devoted considerable space to the doings of the Worcester motor steam fire-engine which belongs to the Norwich Union Fire Insurance Company. The facts are as follow:—The engine was being fitted with a new steam pipe when an alarm of fire was given. In ten minutes the engine was on its way to the fire without its ashpan and proper chimney and spark arrester used when travelling. It went about five miles in fifteen minutes, when a tube burst in the boiler and blew the fire all over the road. This accident might have happened when the engine was pumping, and considering the age of the boiler, and the long time since it was examined, it speaks much for the type of boiler employed.

IN placing their catalogue before the public the Pollock Engineering Company, of Ashton-under-Lyne, who are the sole manufacturers of the Turrell motor-cars and motors, make a big bid for favour. In the first place they state the important fact that all parts and workmanship, even to upholstering, are their own, excepting only tires and electrical ignition apparatus, which come from outside. The Turrell system, it is claimed, is no longer experimental, having stood the test of fifteen months' practical work. The economy of the system is evident when it is known that the normal number of revolutions per minute of the motor is less than 750. Diagrams explain the working of the belt and all mechanical details. The cars which are illustrated are neat, well turned out, and serviceable looking. With each is given away a liberal supply of spare parts and all necessary accessories, as well as a guarantee for six months.

THE latest thing in head lights for motor-cars is the Acetyloid motor-car lamp, the most recent development of the well-known series of apparatus on the Acetyloid system. This system is claimed to be the only one by which a self-contained portable lamp or generator, free from screws, joints, or other devices of a pressure-resisting nature, is rendered possible. The lamp has a handsome appearance, being strongly made of brass, nickel-plated throughout, and fitted with a silver parabolic reflector and convex lens, which gives the appearance of a ball of white fire to the lamp when lighted. The arrangement of the lamp consists of two detachable parts, the front portion containing the lens and reflector; the back part consisting of a case containing the generator, which is attached to the burner by means of a tube, to which is connected a rubber gas bag, which takes the effect of any jolting the car meets with, and thus maintains a regular uniform light throughout the journey. Another form of the lamp is made, wherein the generator is placed in a convenient position on the car, and attached to the head lamp in front by flexible metal tubing. The lamps are made by Messrs. Worsnop and Co., Limited, of Halifax.

DR. WINTER'S SPEED INDICATOR.

THE accompanying illustration shows the speed indicator for use on motor-cars which has lately been devised by Dr. Winter. The indicator, when attached to a motor-car, indicates in miles per hour the actual speed at which the car is travelling. Should the speed vary, the indicator shows all variations. A maximum index is also provided, showing the highest rate of speed made at any part of the journey. The principle of the instrument is that two cog-wheels are thrown into gear with each other automatically and, after gearing together for a certain fixed and known time, automatically separated. Of these two wheels, the driver is actuated by one of the carrying wheels of the vehicle, while the follower communicates with an index moving round a graduated dial. It follows, therefore, that while the wheels are in gear the faster the driver revolves, the further will the index be carried round the dial before the wheels are automatically separated. Before another record of speed can be taken the following wheel is returned to a "zero" position, ready for a fresh measurement; in the meantime, of course, the dial index remains pointing to that speed on the dial (in terms of miles per hour) which was measured in the last record. It will thus be seen that the method adopted secures a fixed and immovable reading during the time the cog-wheels are disengaged (approximately two

seconds). The automatic mechanism by which the cogs are engaged and disengaged is most ingenious, as is also the means by which the index corresponds to the varying speeds. Since the wheel train is carefully calculated, the indicator is, of course, accurate as to reading. The wheels and pinions are cut from steel, and all wearing parts are hardened, tempered, and ground true. The case is practically dust-tight. A maximum speed index is attached, recording up to 55 miles an hour. The instrument, which is slightly larger than an ordinary ammeter, is readily fitted to any description of car, usually and preferably upon the splashboard, the drive being obtained either from the axle or from the hub, any difference in driving wheel diameter being corrected in the gearing between the drive and the indicator itself. The instrument is manufactured by Messrs. Thorpe and Salter, of Clerkenwell, and is being introduced by Mr. F. L. Anderson, of 1, Farnival Street, London, E.C.

THE Automobile Agency, of 3, Cope Street, Dublin, have been appointed Irish agents for the Stirling motor-cars.

OUR paragraph last week regarding the public motor-car service at Bournemouth has brought some interesting information from Mr. W. Parker-Thomas, the manager of the Aberdare Valley Motor Company, Ltd., of Aberdare, South Wales. On Whit Monday this company had five cars out on the road, the number of passengers carried being 2,002 and the total distance run 320 miles. It speaks well for the Aberdare service that not a single mishap occurred to mar the success of the day's working.

THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

THE Earl of Derby, K.G., presided at the third Trials dinner of the Liverpool Self-Propelled Traffic Association, held at the Adelphi Hotel, Liverpool, on Monday night. A very large and influential company gathered together, his Lordship being supported by the Lord Mayor of Liverpool (Mr. Arthur Crosthwaite), Mr. Alfred L. Jones, the Hon. A. F. Stanley, M.P.; Mr. A. F. Warr, M.P.; Mr. W. F. Lawrence, M.P.; Mr. Charles M'Arthur, M.P.; Sir John Alexander Cockburn (Agent-General for South Australia), and other gentlemen. The Earl of Derby proposed the toast of "The King," remarking, among other things, upon the interest his Majesty takes in the science with which the Association is connected. The toast and the other customary loyal toasts were duly honoured. Mr. Charles M'Arthur, M.P., proposed "The Navy and Army."

Commander G. T. Wingfield, R.N., responded, as did also Colonel C. H. Scott, C.B., R.A. The last-named remarked that, if the Army had a more free hand, it might be a self-propelled association. He hoped the result of the trials in Liverpool would be the discovery of the best motor-lorry for military purposes.
